IV. ATLAS OF THE WORLD

EDITOR'S PREFACE

We were founded seventy years ago. During that time the world has changed, politically and socially, more dramatically than anyone in 1897 could have imagined. We are fortunate to publish in this commemorative edition a narrative of those changes in a special Foreword, " Seventy Years On," by Mr. A. J. P. Taylor, Fellow of Magdalen College, Oxford, the distinguished historian who, stepping beyond the academic circle, has provoked widespread interest in his interpretation of the history of our times by trenchancy of analysis and the wit and felicity of his style.

Since *Pears* prefers to look forward the only other retrospective glance we permit ourselves is to reprint the famous *Punch* cartoon of the tramp writing to the Soapmakers to Queen Victoria. It recalls the link which the Cyclopaedia originally had with the famous firm whose name it still bears.

It was during the seventy years of our life that the forces were released which will set the pattern of the seventy years now ahead. The discovery of the electron the year *Pears* was founded that opened the way to a new world of physics; Freud's theories of the mind that radically changed our way of looking at ourselves; the new approaches to physical, mental, and social well being; the generation of nuclear power; electronic computers and automation; observational and theoretical astronomy; the study of living processes; man's projection into space—all have been tributaries to the great stream of advance now flowing ahead.

More people, especially students and other young people, are turning to information and ideas, not only because of growing curiosity about the world they live in, but to use the knowledge so gained for shaping things to better ends.

A capital fact of our times is the close impact upon us all of politics and economics. We have therefore given special attention to our Public Affairs and Economics sections and tried to provide an up-to-date chronicle and analysis of recent changes and to unravel some of the controversies that have accompanied them.

A special new feature in this edition is *The World of Music*, written as a historical narrative with glossary and index.

The current expansion in knowledge of living processes is reflected in the revised text of Part II of the Science section with a picture of the structure and function of genes and enzymes and of their interplay, around which modern molecular biology revolves.

In the Medical section the chapters on diseases of the blood, and of the heart and blood-vessels have been rewritten to incorporate recent knowledge, and there is now a reference (asked for by a reader) to cystic fibrosis, one of the commonest genetically determined disorders affecting children in Britain.

Special topics in the Science and Medical sections, written by eminent authorities, include:

World Energy Resources, telling of available energy resources, the search for new sources, and the more efficient utilisation of energy.

Recent Work on the Moon, describing the new contributions to knowledge made possible by the Russian and American lunar probes.

The Electromagnetic Spectrum, tracing the development of our knowledge of the electromagnetic spectrum, and the interaction of radiation with matter, showing how pure science and technology are inextricably interwoven.

The Contraction of Muscles, clarifying the hope of scientists to be in a better position to recognise and correct disturbances to muscle function in human disease.

Immunisation, giving an insight into the mechanisms of the response of the body to infection.

Drugs acting on the Brain, classifying the different groups of drugs and studying their effects on the central nervous system.

Undernutrition and the Developing Brain, discussing the effects of infantile undernutrition on the growing brain.

The Physical Basis of Memory, explaining the biochemical basis of memory storage and posing the question whether one day a particular skill might be transferred from one man to another by injection.

Games and Recreations now includes notes on natural history and field studies, pony trekking, cruising on inland waterways, music, folk song and dance, and other leisure activities.

Contemporary Theatre discusses recent dramatic trends and gives an account of some of the significant developments of the 1966–67 London season.

The Law of England, besides complete revision, has been expanded to include an article on Adoption.

Ministers and Members of Parliament are listed at the end of *Background to Public Affairs*.

SEVENTY YEARS ON

"Mankind has struck its tents and is on the march." So said General Smuts in 1919, and his words set the theme for the last seventy years. Everything has been on the move, and the speed has been ever faster. This is true in the literal sense. Some men have run a mile in less than four minutes. Others have travelled faster than sound. Men have been to the Poles and to the summit of Everest. Soon, it seems, they will reach the moon. Even ordinary men think nothing of travelling ten times faster than what were called, seventy years ago, express trains.

A fast means of individual transport, the motor car, has had a revolutionary effect on almost every human activity from holidays to war. The motor car bestows an almost limitless freedom of movement on its owner, and this freedom has been fully used. Few people now live near their place of work. Very few die in the place where they were born. Urban life in the traditional sense has almost ceased to exist. Nearly everyone is on the move to what can no longer be called the country. As a result, more old houses have been pulled down in the last seventy years and more new houses built than in the whole of previously recorded history.

The aeroplane has gone far towards obliterating the old barriers of distance. Statesmen fly from one continent to another for a weekend visit. In wartime, no city is beyond the range of aerial bombardment. Communication has also increased in a more abstract way. Seventy years ago, the telephone was a rare instrument, used only for local conversation. Though the telegraph was international, men had to wait for the newspapers to know what was happening in the world. Now, though more men than ever, and women too, read the newspapers, they can also hear the news on radio almost at once. Often events are shown on television as they are actually taking place. The World has become a single parish. No one can escape being affected by remote events which may take place at the other side of the globe. In the past seventy years men have experienced two World Wars and are now gloomily contemplating the prospect of a third.

War has been an almost universal habit ever since the beginning of history, but no epoch has known wars so destructive or so widespread. Eight million men were killed in the First World War. Nearly thirty million men and women were killed in the Second. Material destruction was also great, particularly in the Second World War. Great capital cities—London, Berlin, Vienna, Budapest, Tokyo—were ravaged. Millions of families were rendered homeless. As a culmination, three hundred thousand people at Hiroshima were killed by a single atomic bomb. The Second World War saw a form of destruction even more evil: the planned mass murder of helpless human beings by order of the German Nazi government. Between four and six million Jews were sent to the gas chambers by the Germans. At least four million prisoners of war were killed by Germans, and millions of other nationalities were systematically worked to death.

In any previous age, such terrible events might well have led to the collapse of civilisation. Now mankind has become as formidable in recovery as in destruction. The material damages of war have been almost entirely erased. The stupendous advances in medical science have saved far more lives than war destroyed. Men have learnt how to prevent as well as how to cure diseases, and world population has increased more in the last seventy years than throughout all the previous centuries of man's spell on earth.

Ideas have done more than war to cause change and upheaval. In 1897, when Queen Victoria celebrated her diamond jubilee, " Imperialism " was the word of the day. Three European Powers—Russia, Great Britain, and France—extended their sway over three-quarters of the world's surface. Now virtually all the colonial empires have disappeared. Only the oldest of them, the Portuguese Empire, anomalously survives. New empires have been born and have perished with astonishing rapidity. In 1897, the British Empire in India was twenty-one years old; it had another fifty years to go. But Mussolini's Roman empire in Africa existed only for six years; Japan's Greater East Asia Co-Prosperity Sphere lasted for three years; and Hitler's New Order in Europe, which he announced would last for a thousand years, was dead almost before it was born. Empires with a longer history have also passed away. After the First World War, Austria-Hungary and the Ottoman Empire—each of them descended in their different ways from ancient Rome—were partitioned. Common nationality has taken the place of tradition and hereditary right as the basis of the state. All over the world, old states have been broken up, and new national states, often with fancy national names, have been created.

The change has been equally great in the internal ordering of states. In 1897 monarchy was almost universal except on the American continent. France was the only republic in Europe. Comparatively few monarchies have survived, and none with absolute power. Aristocracy has been as gravely shaken as monarchy. Noble landowners have lost their estates nearly everywhere, and there are few countries where the political leaders still bear hereditary titles. Even Great Britain is ceasing to be an exception, and the House of Lords is little more than a curious relic without power or importance. In 1897 universal suffrage was still unusual. Now most countries practise it, except where white men refuse to recognise the equality of the coloured races. In theory at any rate, democracy has triumphed. Even dictators claim to be ruling on behalf of the people and often manufacture some sort of demonstration by which the will of the people is allegedly shown. Popular right has replaced divine right, no doubt with some pretence in both cases.

This levelling process has gone even further. At first, as kings and emperors disappeared, they were succeeded by Great Men—dictators of one sort or another. The inter-war years were full of them, from Stalin to Hitler. When the Second World War came, it was run by Great Men, Churchill and Roosevelt, even in the democratic countries. Now, apart from elderly survivals such as Mao Tse-tung, Tito, and de Gaulle, there are no Great Men any more. The rulers are indistinguishable in appearance, character, and probably in ability from the ruled. It was well said that, whereas President Roosevelt drew his support from the common man, President Truman was the common man. This is now a universal truth.

The common man has also come to count for more in economic affairs, even if less completely than in politics. Seventy years ago, the rich had virtually all the economic power. Capitalism shaped every advanced country and was penetrating the rest of the world. Social welfare had hardly begun. Many people believed that this system of privilege could be ended only by a revolution, and in 1917 this belief, or fear, seemed to be proved true. There was a Communist revolution in Russia, and for many years afterwards revolutions of the same sort were expected elsewhere. Little of the kind has happened. There have been national revolutions. Fascist gangsters have sometimes intrigued themselves into power. Soviet Russia has imposed Communist governments on her satellites in eastern Europe. But only remote, non-capitalist China has had a Communist revolution, and this revolution was in reality more national than Communist. Soviet Russia remains unique in attempting to run an advanced industrial economy according to socialist rules, and even here, it is said, capitalist practices are creeping in. The Bolshevik revolution has turned out to be an end, not a beginning—the last of the nineteenth-century revolutions, not the fore-runner of universal upheaval. The Communist danger has been a false alarm.

Nevertheless there has been something like a social upheaval, though without violence. Every advanced community now recognises an obligation to care for the welfare of all its citizens. There is free public education, often to a high level, and free health services. Society provides for the young, the old, and the sick. Abject poverty has become rare. In the inter-war years the great social evil was mass unemployment. The great Depression which began in 1929 ravaged the wealthiest countries such as Germany, Great Britain, and the United States. Nothing of the kind has happened since the Second World War. Prosperity seems to have become permanent and universal, no one knows how. It would be rash to believe that politicians have become more skilful or economists wiser than their predecessors. Perhaps the capitalists themselves have discovered, by accident, that greater wealth is to be found in providing for the many instead of for the few. At any rate the Affluent Society has become the pattern of the times.

This optimism must not be carried too far. While the rich countries have grown richer, the poor countries—and they are the great majority—are becoming poorer, not only relatively, but absolutely. Their populations are increasing tumultuously, thanks to medical science; their resources lag behind. Peering into the dark future, many observers anticipate a terrible war of the races, when the countless millions of starving Asia will snatch at the wealth enjoyed by the few advanced communities. We seem to be caught in a race against time, anxiously hoping that birth-control will stem the flood of population before it is too late.

In 1897 most men still believed firmly in Progress. Everything was to become grander and more successful. Now this belief is shaken. This is not due only to the events of the past seventy years—the two wars or the great Depression. It is not due even to the fear of a Third World War which, if it comes, may well end all human life on the planet. It is due fundamentally to a loss of faith. The old certainties have vanished. The various religions which gave men some security throughout the centuries are all losing their hold. Christianity, Mohammedanism, and Buddhism alike no longer command the unquestioned loyalty of believers. Marxism, the latter-day substitute for religion, is equally challenged. Men everywhere worship the Golden Calf—some because they possess it, the rest because they wish to do so. Comfort and enjoyment have become the only goals. Men hope to establish Heaven on Earth, and in a material sense they may succeed. It is less likely that they will find it satisfying.

There was a time when it was supposed that Science could take the place of religion, and certainly no age has made so many scientific discoveries or seen such scientific advance. But the rewards are uncertain. Scientists themselves no longer give confident answers. For them, as for others, the only rule is: "everything changes." Freud destroyed the paramountcy of human reason. Einstein shook the Newtonian laws and substituted the shifting sands of relativity in one devastating formula: "$E = mc^2$." Einstein was the greatest scientist of the age. At the end of his life, he despaired of science, feared that it wrought only evil, and said that he would advise a young man to become a plumber or something equally harmless.

It is too late to turn back. Nothing can stop the probings of the scientific mind. Limitless power is within our grasp. What will men do with it? Will they use it for the common benefit of mankind? Or will they use it blindly for universal destruction? These questions hang darkly over the future. Men have greater opportunities than ever before and also face greater dangers. We shall learn before the end of the century whether they can grapple with their destiny.

A. J. P. Taylor

INDEX

Some of the sections are alphabetically arranged and index themselves. Their contents are not included here except where it is anticipated some special difficulty in reference may arise. Each section has a letter and, where appropriate, the column is given in brackets after the page number, *e.g.*, F8(1), G26(2). The sections "Greek Myths and Legends", "Medical Matters" and "The World of Music" have each a separate index and glossary.

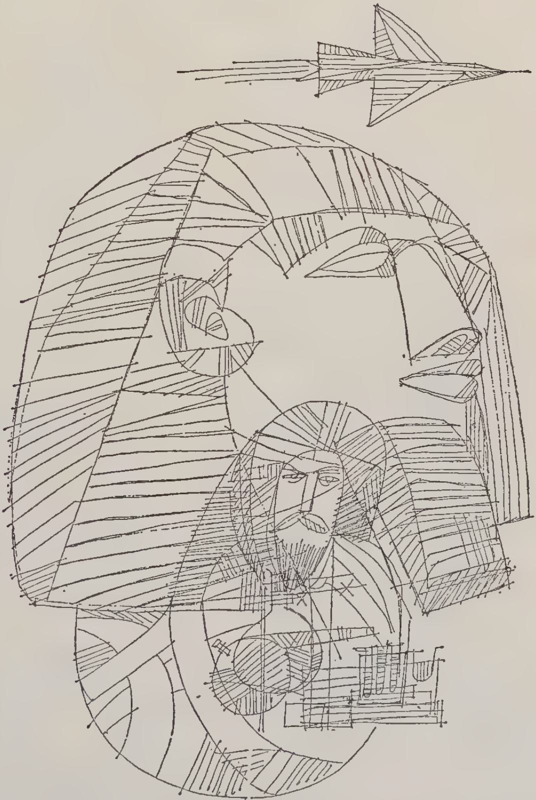
HISTORICAL EVENTS



ILLUSTRATIONS BY JACK LARKIN

CHRONICLE OF EVENTS

Note.—*For classical history and for the past millennium most dates are well established. For other periods there is sometimes considerable uncertainty. Many of the dates in ancient history are either dubious or approximate, sometimes both. For events in prehistory the reader may find it helpful to consult the Geological Time Scale and the sub-section Earliest Men in Part II of the Science Section.*

B.C. PREHISTORY

5,000,000,000 Age of Earth.

3,300,000,000 Earliest known rocks (found in Rhodesia and Manitoba).

2,000,000,000 Life appears.

600,000,000 First large-scale occurrence of fossils.

20,000,000 Early ape fossils (Miocene period—*Proconsul*, E. Africa).

10,000,000 Early ape fossils (Lower Pliocene —*Oreopithecus*, Italy).

1,700,000 Earliest known hominids (Lower Pleistocene—*Australopithecus*, and *Homo habilis* S. Africa, E. Africa.) Oldowan culture—first stage of Palaeolithic or Old Stone Age (hunting and food-gathering) which persisted until end of Ice Age, *c.* 8,000 B.C.

400,000 *Homo erectus* stage (Java, China, Africa) with crude chopping tools and early hand-axes. Heidelberg jaw (Europe).

250,000 Ancestors of Neandertalers and *Homo sapiens*, with advanced hand-axes (Europe: Steinheim and Swanscombe).

70,000 Neandertalers (Europe, Asia, N. Africa). Rhodesian Man (S. Africa). Solo Man (Java). Flake tools.

40,000 First cold phase ends. Neandertal race becoming extinct.

30,000 Second cold phase. *Homo sapiens* (modern man). Implements show significant advances: small knife-blades, engraving tools. Paintings and sculpture; magic rites and ceremonies. Cro-Magnons with Aurignacian culture.

18,000 Final culmination of last ice age. Aurignacian culture dying out to be replaced by Solutrean and then by the Magdalenian cultures. Great flowering of Palaeolithic art.

15,000 First immigrants from Asia to cross Behring Straits?

8,000 Last glaciers in Britain disappeared. Proto-Neolithic in Middle East. Agricultural settlements (*e.g.*, Jericho). Settled way of life leading eventually to such skills as weaving, metallurgy; inventions as ox-drawn plough, wheeled cart.

5,000 Britain becomes an island (land connection with continent severed by melting ice-sheets).

B.C. CIVILISATION IN THE MIDDLE EAST

4000 Susa founded.

3500 Sumerian civilisation flourishes. Cuneiform writing.

3000 First Egyptian Dynasty. Hieratic writing already perfected.
Early Minoan Age (Crete). Pictorial writing, copper, silver, gold in use. Early Mycenean civilisation begins.

2980 Memphis capital of Egypt.

B.C.

2870 First settlements at Troy.

2850 Golden Age of China begins (legendary).

2700 Great Pyramid age in Egypt begins.

2400 Aryan migrations.
Sargon founds Agade: Semitic empire.

2205 Hsia Dynasty begins in China (legendary).

2200 Middle Minoan Age; pottery, linear writing in pen and ink.

1900 Bronze Age begins in Britain.
Stonehenge (1860–1560 B.C.).

1760 Shang Dynasty begins in China (dated traditionally 1760–1122 B.C.).

1750 Aryan invasion of Mesopotamia.

1720 Hyksos conquest of Egypt. War chariots introduced.

1700 Code of Hammurabi at Babylon.

1600 Late Minoan Age: bronze in use.

1550 Sack of Babylon by Hittites.

1546 18th Dynasty in Egypt commences. Civilisation at peak (under Thotmes III, 1490). Chronology more certain.

1500 Powerful Mitanni (Aryan) kingdom in Asia Minor. Phoenicia thriving—trade with Egypt and Babylonia. Vedic literature in India.

1450 Zenith of Minoan civilisation.

1400 Ugarit (N. Syria) culture at its zenith. Cretan civilisation ends: Knossos burnt. Temple at Luxor built.

1377 Amenhotep IV (Ikhnaton), the "heretic" Pharaoh.

1350 Zenith of Hittite civilisation.

1300 Israelite oppression (Rameses II). Phoenician settlements—Hellas and Spain (Cadiz). Tyre flourishing.

1250 Assyrian conquest in Babylon: dominant in Western Asia.

1230 Exodus of Israelites from Egypt.

1200 Attacks on Egypt by "Peoples of the Sea". Downfall of Hittite kingdom. Siege of Troy (Homeric). Beginning of sea-power of independent Phoenician cities. Probably all these are connected with Achaean and other migrations in Aegean area.

1122 Chou Dynasty begins in China (870 years).

1115 Magnetic needle reputed in China.

1028 Establishment of kingship in Israel (Saul).

1000 Jerusalem capital of Israel. David king. *Rig Veda* (India).

961 Solomon begins temple at Jerusalem.

900 Probably period of writing of Homer's epics.

893 Assyrian chronological records begin.

850 Foundation of Carthage (traditional).

781 Chinese record of an eclipse.

776 First Olympiad to be used for chronological purposes.

753 Foundation of Rome (traditional).

750 Greek colonists settling in Southern Italy.

745 Accession of Tiglath-Pileser III; Assyrian Power at its height. Deportation of subject peoples (Israel 722).

683 Kingship abolished in Athens.

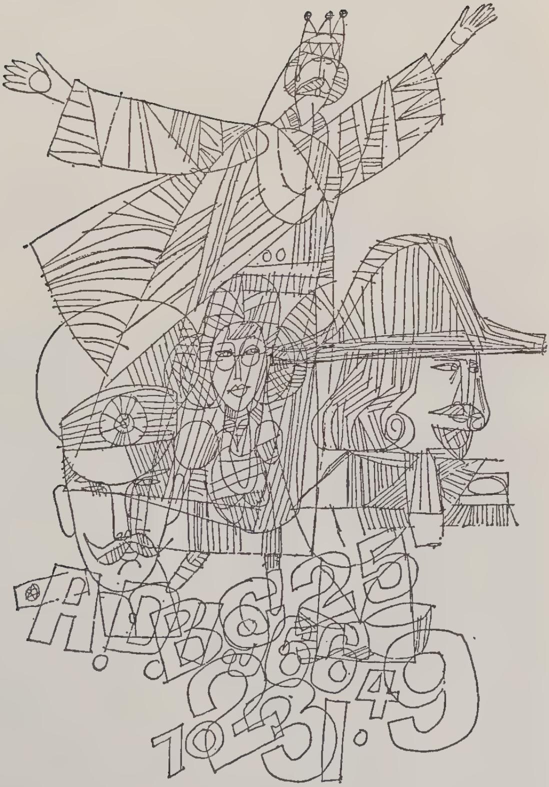
PROMINENT PEOPLE



PROMINENT PEOPLE

A

Abbot, George (1562–1633), Archbishop of Canterbury in 1611, and one of the translators of the authorised version of the Bible.

Abdullah ibn Husein (1882–1951); King of Jordan; made ruler under the British mandate in 1921 and proclaimed King in 1946 when Transjordan (renamed Hashimite Kingdom of the Jordan in 1949) was created an independent state by treaty with Britain. Assassinated.

Abelard, Peter (1079–1142), one of the most influential thinkers of the mediaeval world, b. near Nantes, pupil of Roscelin and William of Champeaux. Living in age of great theological controversy he applied his creative and versatile mind to the problem of Christian faith and held that goodness depends upon intention and free choice. Unrivalled as a dialectician, he acquired great popularity as a teacher and attained great scholastic glory. His romance with Heloïse, niece of Canon Fulbert, has been much written about. The Canon had Abelard castrated and they retired from the world, he to the monastery at St. Denis and she to a nunnery at Argenteuil. Their bodies lie in one tomb at Père la Chaise.

Abercrombie, Lascelles (1881–1938), English poet and critic. Professor of English Literature at London University, 1929–35; Lecturer in Poetry at Queen's University, Belfast, 1931–32.

Abercrombie, Sir (Leslie) Patrick, M.A., F.S.A. F.R.I.B.A. (1879–1957), architect and town-planner. Brother of the above. Lever Prof. of Civic Design at Liverpool, 1915–35; Prof. of Town Planning at University College, London, 1935–46. Consulted on the replanning of Plymouth, Hull, Bath, the Clyde Valley, Dublin, Addis Ababa, Colombo, and Cyprus. Produced the famous plan for Greater London, 1943.

Acheson, Dean Gooderham, A.B., LL.B. (b. 1893), U.S. Secretary of State in the Truman Administration, 1949–52. Appointed 1961 to advise Sec. of State Dean Rusk on American policy in regard to Nato.

Acton, John Emerich Edward Dalberg, 1st Baron, K.C.V.O., D.C.L., LL.D. (1834–1902), English historian and brilliant scholar; Professor of Modern History at Cambridge, 1895–1902.

Adam, Robert (1728–1792), one of four Scottish brothers, all distinguished architects. Developed a characteristic style in planning and decoration and designed many important public and private buildings and interiors. His achievements include the great aristocratic houses of Harewood, Yorks; Osterley, Middlesex; Syon, Middlesex; Kedleston, Derbyshire.

Adams, John (1735–1826), succeeded Washington as President of the United States, and was the first of the Republic's ambassadors to England.

Adams, John Couch, F.R.S. (1819–92), English mathematician and astronomer. Shared credit for discovery of the planet Neptune, 1846, with the French astronomer, Leverrier (1811–77).

Adams, Samuel (1722–1803), American statesman, known as the "American Cato," who worked all his life for American Independence and signed the Declaration (1776). He organised the "Boston Tea Party."

Adams, William (*c.* 1564–1620), first Englishman to visit Japan; b. Gillingham, Kent. His knowledge of shipbuilding, navigation and European affairs proved of great value to the Japanese emperor Ieyasu at a time when he was interested in developing foreign trade.

Addams, Jane, B.A., M.A. (1860–1935), famous American sociologist who founded Hull House, Chicago, in 1889.

Addison, Christopher, 1st Viscount, K.G. P.C. M.D., F.R.C.S. (1869–1951). After joining the Labour Party held successive Ministerial offices in 3 Labour Governments and became leader of the House of Lords. Forsook his profession a professor of anatomy at Sheffield Univ. for political career because of his great interest i public health and social reform.

Addison, Joseph (1672–1719), achieved fame bot as a writer and a politician. Held many office under various governments; contributed to th *Tatler* started by his friend Steele and with hi founded the *Spectator*.

Adenauer, Dr. Konrad (b. 1876), Chancellor of th West German Federal Republic, 1949–6 Founder and Chairman of the Christian Demo cratic Party, 1945–66. To a defeated German he gave stable constitutional government, place in the Western alliance, and provide strong, consistent leadership. He brough about reconciliation with France but resisted a attempts at accommodation with Russia. *Se also* **Section C, Part I.**

Adler, Alfred (1870–1937), Austrian physician an psychiatrist and founder of the school of indiv dual psychology. An earlier pupil of Freud, h broke away in 1911, rejecting the emphasis o sex, and regarding man's main problem as struggle for power to compensate for feelings o inferiority. (*See* **Section J.**)

Adrian IV, Nicholas Breakspear (d. 1159), pop (1154–59), the only English pope, b. near S Albans. Crowned Frederick Barbarossa a German emperor. Granted overlordship of Ire land to Henry II which started a dispute whic raged for 800 years.

Adrian, Edgar Douglas, 1st Baron, O.M., M.A M.D., F.R.S., F.R.C.P. (b. 1889), Prof. o Physiology, Cambridge Univ. 1937–51; Maste of Trinity Coll., Cambridge, 1951–65, Pres. of th Royal Society 1950–55; Pres. of the Britis Association, 1954; Chancellor of Leiceste University, 1958. Trustee of Rockefeller In stitute, 1962. Nobel Prize for Medicine, 1932

Æschylus (525–456 B.C.), father of Greek trag drama. Composed seventy plays and gaine the prize for dramatic excellence thirtee times.

Æsop, name famous for the fables preserve principally through Babrius (2nd century A.D. About him nothing is known; according t legend he was a Greek slave in the 6th centur B.C. who had a number of wild adventures.

Agassiz, (Jean) Louis (Rodolphe) (1807–73), Swis American zoologist and geologist. Author o *Researches on Fossil Fishes* (1833–43), an *Studies on Glaciers* (1840). He was an oppone of Darwin.

Agricola, Gnæus Julius (A.D. 37–93), becam Roman Consul of Britain A.D. 78. Strengthene the power of the Romans in this country, co rected many abuses, and did much to encoura trade and industry. Remained in Britain years.

Agrippa, Marcus Vipsanius (63–12 B.C.), th greatest military commander of Rome aft Julius Cæsar.

Ahmad Khan, Sir Syed (1817–98), great India educationist and social reformer who founde what is now the Aligarh Muslim University.

Aird, Sir John, Bart. (1833–1911), contracti engineer of eminence, associated with man great undertakings in different parts of th world, the Aswan Dam on the Nile, complete in 1902, being one of his achievements.

Airy, Sir George Biddell, K.C.B., F.R.S. (180 1892), Astronomer Royal (1835–1881) Greenwich Observatory, where his brilliance an industry led to many important researches.

Akbar, Jalal-ud-din Mohammed (1542–1605), th greatest and wisest of the Mogul emperors an one of the great figures of history. He initiate economic and social reforms and succeeded unifying his vast empire. His courts at Del and Agra were centres of culture and learning.

Alanbrooke, Field-Marshal Viscount, K.G., G.C.

O.M., G.C.V.O., D.S.O. (1883–1963), one of the greatest soldiers of modern times; Chief of Imperial General Staff, 1941–46. Sir Arthur Bryant's *The Turn of the Tide* (1957), and *Triumph in the West* (1959), are based on the war diaries of Lord Alanbrooke.

Alaric I (376–410), the famous chief who after the death of Theodosus I led the Visigoths against the Romans, and afterwards invaded both Greece and Italy. He took Rome in 410, and died soon afterwards. It is said that he was buried with a vast treasure in the bed of the River Busento, and so that the Romans might not discover his remains, the slaves who buried him were put to death.

Alban, St., who flourished in the latter part of the 3rd century, was born at Verulamium (where St. Albans now stands) and served as a soldier under Diocletian at Rome. Later he was converted to Christianity, and was for a time a renowned preacher of that religion, finally suffering martyrdom. Offa, king of the Mercians, built a monastery to his memory near Verulamium, four or five hundred years later. St. Alban's Day: Roman Catholic Church, June 22nd; Anglican Church, June 17th.

Albani, Madame (1852–1930), stage name of Marie Louise Emma Lajeunesse, Canadian operatic soprano. Made her first appearance in England at Covent Garden in 1872 and was for many years a leading prima donna, achieving great celebrity as Elsa in *Lohengrin.*

Albert, Prince Francis Augustus Charles Emmanuel, Consort of Queen Victoria (1819–1861). On his marriage with the Queen in 1840 Parliament granted him an income of £30,000 a year. The prince adapted himself with considerable success to the difficulties of his position, and gradually secured the confidence and esteem of statesmen and public alike. The great Exhibition of 1851 owed much of its success to his efforts. He died of typhoid fever in December, 1861. The Albert Memorial forms a national tribute to his memory.

Albertus Magnus, St. (1206–80), Dominican scholastic philosopher, b. Bavaria, one of the great mediaeval university teachers and the most learned man of his time. St. Thomas Aquinas was his favourite pupil. Took scientific interest in nature and made notable botanical observations.

Alcibiades (*c.* 450–404 B.C.), treacherously killed in battle at Melissa, Phrygia, was the celebrated Athenian statesman and general, pupil and friend of Socrates.

lcock, Sir Walter Galpin, M.V.O., Mus. Doc., F.R.C.O. (1861–1947), English musician, eminent both as organist and composer of church music. He played at the Coronations of King Edward VII, King George V and King George VI. Organist to Salisbury Cathedral, 1916–47, and Professor of Organ at Royal College of Music, 1893–1939.

lcott, Louisa May (1832–88), American authoress; the charm and naturalness of her writings made her a favourite among children's authors, and her books are still read on both sides of the Atlantic. Her most famous book, *Little Women,* appeared in 1868.

lcuin (735–804), scholar and ecclesiastic, a leader of the Carolingian Renaissance. His works include poems and historical and theological writings. (*See also* **J30(1)**).

ldred (d. 1069), a powerful ecclesiastic of the 11th century in great favour with the Conqueror, whom he crowned. Bishop of Worcester (1044–60), and Archbishop of York (1060–1069).

lekhine, Dr. (Aljechin) Alexander (1892–1946), world chess champion, 1927–35, 1937–46.

lembert, Jean le Rond d' (1717–1783), a Parisian mathematician and philosopher who achieved great eminence by his numerous scientific works, including the *Theory of the Winds* and the *Precession of the Equinoxes.*

lexander of Hillsborough, Earl, K.G., P.C., C.H. (1885–1965). Leader of the Labour peers in House of Lords, 1955–65; Min. of Defence, 1946–50; First Lord of the Admiralty, 1929–31, 1940–45, 1945–56.

lexander of Tunis, Field-Marshal Earl, P.C., K.G., G.C.B., O.M., G.C.M.G., D.S.O. (b. 1891). Comm. 1st Div. at Dunkirk; C.-in-C. Southern Command, 1940–42; G.O.C. in Burma, 1942, when he conducted a masterly retreat; C.-in-C. Middle East, 1942–43, when he was largely responsible for driving the enemy out of North Africa; C.-in-C. Allied Armies in Italy, 1944; and Supreme Allied Commander, Mediterranean, 1944–45, when he successfully led a force drawn from many different nations. Gov.-Gen. of Canada, 1946–52; Min. of Defence, 1952–54.

Alexander II. of Russia (1818–1881), succeeded his father, the Emperor Nicholas, in 1855. In 1861 he emancipated 23 millions of serfs. On March 13, 1881, was assassinated by bombs thrown beneath his carriage in St. Petersburg by Nihilists.

Alexander the Great (356–323 B.C.). King of Macedon, succeeded his father Philip in 336 B.C., and from the first showed himself fitted for mighty military exploits. He conquered in turn the Thebans, the Persian Satraps, overthrew Darius, overran Syria and Phœnicia, possessed himself of all the cities along the Mediterranean, conquered Egypt, founded Alexandria, and finally retired upon Babylon, where he died eleven days later.

Alexandra, Queen (1844–1925), d. of Christian IX. of Denmark, married to the Prince of Wales (afterwards Edward VII.) on March 10, 1863. Queen from Jan. 22, 1901, to May 6, 1910.

Alfieri, Count Vittorio (1749–1803), the Italian poet, was the author of twenty-one tragedies and six comedies.

Alfonso the Wise (1221–1284), a celebrated King of León and Castile, founder of the legal code which became the basis of Spanish jurisprudence, a liberal patron of literature and science, particularly of astronomy; dethroned by his son Sancho in 1282.

Alfred the Great (849–99), king of Wessex, son of Aethelwulf; succeeded his brother as king in 871 and found himself in conflict with the Danes from the outset. After years of effort he won decisive battle of Ethandum (Edington), 878. He prepared for further attacks by the Danes by building ships, fortifications, and by reorganising the militia or *fyrd,* defensive measures which eventually withstood the invading forces. Besides being a great warrior, a very able legislator and administrator, he was also a man of letters and responsible in great measure for the revival of English scholarship.

Allenby, Field-Marshal Viscount, G C.B., G.C.M.G., G.C.V.O. (1861–1936), brilliant cavalry soldier. Served on Western front, 1914–16; commanded in Palestine, 1917–18, capturing Jerusalem on December 9th, 1917. High Commissioner for Egypt, 1919–25.

Alleyne, Edward (1566–1626), a famous actor, contemporary of Shakespeare and founder of Dulwich College.

Alma-Tadema, Sir Lawrence, O.M., R.A. (1836–1912), the son of a Netherlands notary, he came to England in 1869, where he soon made a name for himself as a painter of classical pictures of great beauty of colour and delicate design.

Ampère, André Marie (1775–1836), French mathematician who devoted himself to the study of electricity and magnetism, and was the first to propound the electro-dynamic theory.

Amundsen, Captain Roald (1872–1928). Norwegian explorer, the first to navigate the North-west Passage and the first to reach the South Pole. Sailing in the fishing smack *Gjöa,* he negotiated the North-west Passage in the 3 years, 1903–6. In 1911 he sailed south in the *Fram* and reached the Pole on December 14th, 1911, a month before his English rival Scott. He failed to complete a flight across the North Pole in 1925, but succeeded the next year. He lost his life in the Arctic while attempting to rescue Nobile, who had crashed in the *Italia.*

Anacreon (*c.* 560–475 B.C.), the celebrated Greek poet whose Odes hold a high place in poetic literature.

Anaxagoras (488–428 B.C.), Greek philosopher of Ionia who came to Athens 464 B.C. He inspired Pericles and the poet Euripides with his great love of science, and is said to have been the teacher of Socrates, who, however, differed from him. His rational theories outraged religious opinion and he retired to his native Asia Minor.

Anaximander (611–547 B.C.), Greek philosopher of Miletus in Asia Minor, pupil of Thales. He was the first among the Greeks to make geographical maps, and to speculate on the origin of the heavenly bodies; he introduced the sun-dial from Babylon or Egypt.

Anaximenes (b. *c.* 570 B.C.), the last of the Milesian school founded by Thales. For him the primal substance was air and he was the first to see the differences between substances in quantitative terms.

Andersen, Hans Christian (1805–1875), perhaps the most gifted writer of fairy tales the world has known. *Mit Livs Eventyr* (The Story of My Life) is as interesting as his fairy tales, which include *The Ugly Duckling*, *The Little Mermaid*, *The Emperor's New Clothes*, *The Little Match-seller*. Born and died in Denmark.

Anderson, Elizabeth Garrett, M.D. (1836–1917), one of the first English women to enter the medical profession. Practised in London for many years. In 1908–9 was Mayor of Aldeburgh, her native town, the first woman to be a mayor.

Andrea del Sarto (1487–1531). This celebrated son of a Florentine tailor was one of the great Italian artists of his time, known as the "faultless painter." Most of the famous galleries of the world contain examples of his magnificent fresco and other painting, mainly dealing with religious subjects.

Andrée, Salomon August (1854–1897), a Swedish explorer who attempted in 1897 to reach the North Pole by balloon, but, except for a message by pigeon despatched two days after his ascent, was not heard of again until in August 1930 a Norwegian scientific expedition led by Dr. Gunnar Horn discovered the remains of the Andrée expedition on White Island. The discovery included a log-book, sketch maps and the diaries kept by Andrée.

Andrew, Saint, one of the apostles of Jesus, brother of Simon Peter, whose festival is observed on November 30th. He became the patron saint of Scotland in the eighth century.

Angelico, Fra (1387–1455). Italian painter of religious subjects, mostly in the form of frescoes, of which the best examples are at Florence.

Angell, Sir Norman (b. 1874), author and publicist, whose works include *The Economic Chaos* and *The Peace Treaty* (1919), *The Great Illusion* (1910) and *The Money Game* (1928). Nobel Prize for Peace 1933.

Ångström, Anders Jöns (1814–74), Swedish physicist, whose life was devoted to the study of heat, magnetism and spectroscopy, and in all three he contributed greatly to scientific knowledge. The unit used for measuring the wavelength of light was named *Angstrom* in his honour.

Anne, Queen (1665–1714), Queen of Great Britain and Ireland from 1702 to the time of her death, was a daughter of James II., and succeeded William III., her cousin. During her reign England, in alliance with Austria, Holland, Prussia, Savoy, and Portugal, entered upon the War of the Spanish Succession. Anne's reign has been called the Augustan Age of Britain because of the many eminent men of letters who flourished during that period. She was the last of the Stuarts to occupy the British throne. The most important domestic event of her reign was the passing of the Act of Union with Scotland in 1707.

Anouilh, Jean (b. 1910), French playwright, several of whose plays have been translated into English, including *Roméo et Jeannette* (Fading Mansion), *Eurydice* (Point of Departure), *L'Invitation au Château* (Ring Round the Moon), and he has made a number of films. (*See also* I7).

Anselm St. (1033–1109), Archbishop of Canterbury, was a native of Aosta, and succeeded Lanfranc as English Primate. He was in serious conflict with William Rufus on the question of ecclesiastical rights, and for a time suffered exile. Under Henry I., he regained power, making a compromise with that monarch which enabled him to carry on his theological work in comparative harmony. He died at Canterbury, and was canonised in 1494, his day being celebrated in the Roman Church on April 21st.

Anson, George, 1st Baron (1697–1762), a navigator of great eminence, whose *Voyage round the World* is still a popular book of adventure. He won many victories, obtained a peerage, rose to full Admiral's rank in the Navy, and served two terms as First Lord of the Admiralty.

Antoninus Pius (86–161), Emperor of Rome from A.D. 138 to 161, the successor of Hadrian. He governed with ability and his reign brought peace and prosperity to the empire. It was during his reign that the wall between the Forth and Clyde was built.

Antonius Marcus or Mark Antony (*c.* 83–30 B.C.), celebrated Roman Triumvir and General; a warm supporter of Cæsar; but engaged in intrigues after the latter's death, and was opposed by Brutus and Cassius. His association with the Egyptian Queen Cleopatra is the subject of Shakespeare's play. Committed suicide after defeat by Octavian.

Antony, St. (or Anthony) (*c.* 251–356), was a native of Upper Egypt, and according to his own account spent much time in conflict with the devil. He is one of the best-known saints of the Roman calendar, and his festival is on January 17th. He was believed to give relief to those who appealed to him when suffering from erysipelas, from which tradition the name St. Anthony's Fire is given to the disease.

Apelles, Greek painter, the most celebrated of antiquity, who flourished in the 4th century B.C. at the time of Alexander the Great. His most famous pictures, which have not survived, are of Alexander wielding the thunderbolts of Zeus and of Aphrodite rising from the sea.

Apollinaire, Guillaume (Wilhelm Apollinaris Kostrowitzi) (1880–1918), French poet representative of the restless and experimental period in the arts before the First World War. He invented the term *surrealism*. Born in Rome of Polish extraction.

Appert, Nicholas (1752–1841), sometimes known as François Appert, invented the method of preserving animal and vegetable foods by means of hermetically sealed cans or tins. He had no scientific training, but his painstaking work and countless experiments bore the mark of a true scientist. His revolutionary methods paved the way for the creation of a vast world industry which cans millions of tons of food a year.

Appleton, Sir Edward Victor, G.B.E., K.C.B., D.Sc., F.R.S. (1892–1965), English physicist; worked under Rutherford at Cavendish Lab. (1920–24); Prof. of Physics, London Univ. (1924–36), Prof. of Natural Philosophy at Cambridge (1936–39), Sec. of D.S.I.R. (1939–49). Best known as the discoverer of the ionised region of the upper atmosphere which became known as the Appleton Layer. His researches led to the development of radar. Nobel Prize for Physics, 1947; Pres. Brit. Ass., 1953.

Apollonius of Perga (fl. 220 B.C.), Greek mathematician of the Alexandrian school, remembered for his conic sections; introduced the terms *ellipse*, *parabola*, and *hyperbola*.

Apollonius Rhodius (fl. 250 B.C.), scholar and poet of Alexandria and Rhodes, librarian at Alexandria. He wrote on the text of Homer and is remembered for his epic *Argonautica* about the Argonaut heroes.

Aquinas, Thomas, Saint (*c.* 1225–74), chief scholastic philosopher whose system was ruled by Leo XIII in 1879 to be the official Catholic philosophy. He was greatly influenced by Aristotle. The most important of his works are *Sumna contra Gentiles* and *Sumna theologica*.

Arago, Dominique Francois Jean (1786–1853), French astronomer and physicist, remembered for his discoveries in electromagnetism and optics.

Archimedes (287–212 B.C.), Greek mathematician, physicist, and inventor, to whom we are indebted for his discoveries in mechanics (notably the lever), hydrostatics (floating bodies), and for the invention of the famous Archimedean screw. He lived most of his life in Syracuse, and was killed there during the siege by the Romans under Marcellus.

Argand, Aimé (1755–1803), Swiss physician, inventor of the lamp bearing his name, which was the first to admit a current of air to increase the power of the flame, by use of a chimney glass and circular wick.

Ariosto, Ludovico (1474–1533), one of the most celebrated of the Italian poets, author of *Orlando Furioso*. Besides this famous epic he wrote many comedies, satires, and poems.

Aristides (530–467 B.C.) Athenian statesman and general who achieved fame at the battle of Marathon, 490 B.C.

ristippus (c. 435–356 B.C.), founded the Cyrenaic school of philosophy, which taught that sensual pleasure was the only happiness. He was a native of Cyrene, in Africa, but became a pupil of Socrates, and settled in Athens.

ristophanes (c. 444–c. 385 B.C.) was one of the foremost Athenian play-writers and the greatest of the Greek comic poets. His plays are full of satire, and deal unsparingly with the people and institutions of his time.

ristotle (384–322 B.C.), Greek philosopher, pupil of Plato, after whose death in 347 he left Athens to become tutor to the young prince Alexander of Macedon. Subsequently at Athens he established his famous school in the garden known as the *Lyceum*, where he lectured in the *peripatos* (cloister) which gave it its name *Peripatetic*. He took the whole field of knowledge as his subject, giving it unity, and providing a philosophy which held its own for 2,000 years.

rkwright, Sir Richard (1732–1792), was a native of Preston, and in early life a barber and travelling hairdealer. Becoming interested in mechanical problems, he set himself the task of inventing an improved cotton-spinning machine. Hargreaves' spinning-jenny was then the leading machine, but the yarn it produced could only be used for weft; it was not compact enough for warp threads. Arkwright therefore experimented until, by adopting an arrangement of rollers that moved with different velocities, he succeeded in perfecting his "spinning-frame," which successfully produced a yarn that could be used for warp as well as for weft. He took out his first patent in 1769, and entering into partnership with Mr. Jehediah Strutt, of Derby, became a manufacturer on a large scale, in 1771 establishing the first spinning-mill worked by water-power.

rne, Dr. Thomas Augustine (1710–1778), English composer of considerable merit and of great popularity in his day. He composed numerous ballad operas, and at Drury Lane, Covent Garden, and Vauxhall organised the chief performances for long periods. His best-known opera was *Artaxerxes*, and his most popular songs were *Rule, Britannia!* and *Where the Bee Sucks*.

rnold, Matthew (1822–1888), son of Dr. Thomas Arnold, achieved a high reputation as poet and critic. As the propounder of the principles of "sweetness and light," as well as by his graceful verse, he secured a high place amongst the literary men of the Victorian era.

rnold, Thomas, D.D. (1795–1842), headmaster of Rugby from 1828 to his death. His influence at Rugby was such as to give that institution a supreme position among English public schools. A man of intense spiritual feeling, of a sympathetic and lovable nature, yet possessed of all the necessary attributes of scholarship, he was greatly esteemed and venerated.

rrhenius, Svante August (1859–1927), Swedish chemist, one of the founders of modern physical chemistry. Received 1903 Nobel Prize for originating the theory of electrolytic dissociation (ionisation). Director of the Nobel Institute, 1905–27.

rrol, Sir William (1839–1913), well-known contractor and engineer, whose firm built the Tay, Forth, and London Tower Bridges as well as the Manchester Ship Canal. Originally a piecer in a cotton-mill, and later a working blacksmith.

rtaxerxes was the name borne by several ancient Persian kings, some of whom achieved great distinction. The first Artaxerxes was the son of Xerxes, and reigned from 464 B.C. for 40 years; he was succeeded by Darius II. (424–404 B.C.), who in turn was followed by Artaxerxes II., who reigned until 358. Artaxerxes III, the last to bear the name, was a cruel and treacherous man and was poisoned in 338.

rthur, fabled Celtic warrior of c. A.D. 600, the first reference to whom is in the 9th-cent. chronicle of Nennius, who speaks of his 12 victorious battles against the invading Saxons. His legend developed into a vast literature in mediaeval times, which was welded together by Sir Thomas Mallory in his great work *Morte d'Arthur*.

rundel, Thomas, Archbishop of Canterbury (1353–1414), in the reigns of Richard II, and Henry IV, previously Bishop of Ely and Archbishop of York, and for a time Lord Chancellor. An active politician and bitter enemy of heresy.

Ashfield, Lord, P.C. (1874–1948), President Board of Trade, 1916–19; M.P. Ashton-under-Lyne, 1916–20; first Chairman of the London Passenger Transport Board created in 1933.

Aske, Robert, the leader of the Pilgrimage of Grace, directed against the Reformation; executed 1537.

Asoka (273–232 B.C.), Emperor of India (c. 255–c. 237 B.C.), and the most powerful ruler of his time, his Empire extending from the Himalayas to what is now Madras. He was the first ruler to embrace Buddhism and accord it recognition. Becoming a Buddhist (c. 257 B.C.) he turned aside in disgust from the thought of his earlier military conquests, and attempted by missionary propaganda to spread Buddhism throughout his lands. Many rocks and pillars are inscribed with his moral exhortations. He gave great impetus to Buddhism by organising it as the state religion.

Asquith, Herbert Henry, 1st Earl of Oxford and Asquith (1852–1928), Liberal statesman who led a great peacetime administration from 1908 until the outbreak of the First World War and the wartime coalition with the Conservatives from 1915–16 when he was displaced by Lloyd George. Home Sec. (1892–95) in Gladstone's last ministry; Chan. of the Exchequer (1904–8) under Campbell-Bannermann whom he succeeded as Prime Minister. His government enacted important social reforms including old-age pensions (1908) and unemployment insurance (1911). The death of Edward VII in 1910, the struggle over the Irish Home Rule Bill, the declaration of war on Germany, and the Easter Rising in Dublin in 1916 were among the events of his premiership. He resigned the leadership of the Liberal Party in 1926. Earldom of Oxford and Asquith conferred, 1925.

Asser, a Welsh monk of the tenth century, author of a remarkable life of King Alfred.

Astor, John Jacob (1763–1848), the founder of the Astor family of millionaires, was a native of Heidelberg, and emigrating to America, went out to the North-West and began trading in furs, soon building up a large fortune, which he invested in New York real estate.

Astor, Nancy Witcher, Viscountess, C.H. (1879–1964), the first woman M.P. to take her seat in the House of Commons, an American by birth, wife of the 2nd Viscount Astor (1879–1952).

Atatürk, Kemal (1881–1938), builder of modern Turkey. A fine soldier, he defended the Dardanelles against the British in 1915 and drove the Greeks out of Turkey in 1922. President of the Turkish Republic, 1923–38.

Athanasius, St. (296–373), was Bishop of Alexandria. He spent much of his time in bitter theological controversy, and was driven from Alexandria; taking refuge in the desert, he wrote numerous letters in support of Christian doctrine, and under Julian was recalled to Alexandria. The Athanasian creed is supposed to reflect his belief.

Athelstan (895–940), grandson of Alfred the Great, was crowned King of England in 925, and was the first ruler of all England.

Atherstone, William Guybon (1813–98), South African geologist and an originator of the South African diamond industry. He drew attention to the possibility of diamonds near Kimberley and in 1867 identified a crystal found near the Vaal River, thus helping to start mining development.

Attila (406–453), King of the Huns, was a warlike leader, who achieved many conquests over the Roman forces, committing great ravages and laying large tracts of country waste. He marched through Germany and Gaul, and died as he was preparing for another invasion of Italy.

Attlee, Clement Richard, 1st Earl, O.M., K.G., P.C., C.H. (b. 1883), Prime Minister in two successive Labour Governments, 1945–51; served as Deputy Prime Minister to Mr. Churchill, 1942–45. He was educated at Haileybury and University Coll., Oxford. Called to the Bar in 1905; tutor and lecturer in social science at the London School of Economics, 1913–23. Became Mayor of Stepney in 1919, Labour M.P. for Limehouse in 1922, and Parliamentary Leader of the Labour Party, 1935–55. During his Premiership the welfare society was established and the freedom and independence of India granted. Retired in 1955; earldom conferred. His writings include an autobiography, *As it Happened* (1954), and *Empire into Commonwealth* (1960). *See also* Section C, Part I.

Auber, Daniel François Esprit (1782–1871), a distinguished French composer of light operas, *Masaniello, Fra Diavolo, Le Domino Noir*, etc.

Auchinleck, Field-Marshal Sir Claude J. E., G.C.B., G.C.I.E., D.S.O. (b. 1884), Indian Army officer who was C.-in-C. Middle East, 1941–42, and the last British C.-in-C. in India, 1943–46.

Auden, Wystan Hugh (b. 1907), influential poet and dramatist, b. in England, naturalised American. Succeeded C. Day Lewis as Prof. of Poetry, Oxford Univ., 1956–61.

Auer, Leopold (1845–1930), the famous Hungarian violinist and teacher of the violin, among his pupils being Mischa Elman and Jascha Heifetz.

Augustine, Saint (354–430) the greatest of the Latin fathers, bishop of Hippo, b. at Tagaste in N. Africa of a pagan father and Christian mother (Saint Monica). He ranks high as a philosopher and his influence on Christianity has been second only to that of St. Paul. He was a voluminous writer, the most important works being his *Confessions*, the *City of God*, *On the Trinity*, and *On the Work of Monks*.

Augustine of Canterbury, Saint (d. *c.* 605), the Roman Benedictine missionary monk who was sent to Britain by Gregory the Great in 597 to convert the English peoples to Christianity. He became the first archbishop of Canterbury.

Augustus, Caius Octavianus (63 B.C.–A.D. 14), Roman emperor, succeeded Julius Cæsar. After a triumvirate of twelve years, in which he was associated with Mark Antony and Lepidus, he became supreme ruler and for forty-five years exercised a beneficent and powerful sway. He was a devoted patron of Horace and Virgil.

Aurelius, Marcus Antoninus. *See* Marcus Aurelius Antoninus.

Auriol, Vincent (1884–1966), French politician. Voted against surrender in 1940, was interned and escaped to London in 1943. President of the French National Assembly, 1946, and of the Fourth Republic, 1947–54.

Aurangzeb (1618–1707), Mogul emperor of India, 1659–1707, son of Shah Jehan. He was a ruler of ability, and greatly extended his empire by conquest, but his zeal for Mohammedanism aroused the hatred of the Hindus and his persecution of the Sikhs transformed them from a pacifist sect into a militant brotherhood. When he died the disruption of the vast Mogul territory rapidly followed.

Austen, Jane (1775–1817), author of *Emma, Mansfield Park, Northanger Abbey, Persuasion, Pride and Prejudice*, and *Sense and Sensibility*. Though confining herself to the personal relations of the English middle classes, she combined artistry, accuracy, imaginative power, satiric humour, sense, and genuine feeling with the ability to create a vast range of living characters, and is often considered the most perfect English novelist.

Austin, 1st Baron, K.B.E. (1866–1941), was the well-known English motor manufacturer. He was the pioneer of the small car—the 7-horse-power car—which he put on the market in 1921.

Avenzoar (Ibn Zuhr) (*c.* 1090–1162), a Moslem physician, born in Seville, the greatest of his time. His chief work was the *Tasir*.

Averroës (Ibn Rushd) (1126–98), Arab philosopher and medical writer, born in Córdova, last and most famous thinker of Moslem Spain. He studied philosophy, theology, mathematics, medicine, and jurisprudence. His greatest works are his commentaries on Aristotle. He was a friend of Avenzoar.

Avicenna (980–1037) of Bokhara, Arab philosopher and physician whose *Canon of Medicine* had an enormous influence on mediaeval Europe.

Avogadro, Amedeo (1776–1856), Italian physicist, remembered for his hypothesis, since known as Avogadro's Law, that equal volumes of gases under identical conditions of temperature and pressure contain the same number of molecules.

Avon, Earl of. (*See* Eden, R. Anthony.)

Ayrton, William Edward, F.R.S. (1847–1908), English electrical engineer, inventor of a number of electrical measuring instruments. His first wife, Matilda Chaplin Ayrton (1846–83), was one of the first woman doctors and his second wife, Hertha Ayrton (1854–1923), became known for her scientific work on the electric arc and sand ripples and for her work for woman suffrage.

Ayub Khan, Mohammad, Field Marshal (b. 1907), military leader and President of Pakistan since 1958; educated at Aligarh Moslem Univ. and Sandhurst. Under the 1962 constitution all executive authority is vested in the President.

Azikiwe, Rt. Hon. Nnamdi, LL.D. (b. 1904), Nigerian statesman. His office as Pres. of Fed. of Nigeria, held since 1963, was suspended by military coup (Jan. 1966).

B

Baber or Babar (Zahir ud-din-Mahomet) (1483–1530), founder of the Mogul dynasty which ruled Northern India for three centuries, and a descendant of Tamerlane.

Bach, Johann Sebastian (1685–1750). Born at Eisenach, Germany, he became one of the greatest composers in history and has been called the father of modern music. During his appointment as organist at the Thomaskirche, Leipzig, he composed all his great devotional music, including the wonderful St. Matthew and the St. John Passion and the B minor Mass. His incessant labour affected his eyes, and in 1749 he became totally blind. His family was connected with music for seven generations, of which his was the fifth. *See* Section E.

Bach, Carl Philipp Emanuel (1714–88), third son of Johann Sebastian Bach. He is important in the history of music as one of the first experimenters in the symphonic and sonata form.

Backhaus, Wilhelm (b. 1884), German pianist, recognised as one of the most gifted, especially in the interpretation of the great classical and romantic concertos. Professor of the Piano at the Royal College of Music, Manchester, 1905.

Bacon, Francis, Lord Verulam, and Viscount St. Albans (1561–1626), one of the greatest of English philosophers and statesmen; Attorney-General to Elizabeth; Lord Chancellor under James I. His political career was tarnished by certain acts of corruption, for which he paid the penalty, but his writings were marked by keen insight, brilliancy of language, and a depth of thought which place them in the first rank of philosophical literature. His *Novum Organum* and his *Essays* are splendid monuments of learning and wisdom.

Bacon, Roger (1214–1294), the Franciscan friar, was a man of remarkable gifts, of great learning and inventive power. In an age of darkness he was the first to insist on the importance of experiment and can claim the title of founder of experimental science. Optics, explosives, engines, mechanical flight came within the range of his researches. The invention of gunpowder has been attributed to him, but without adequate evidence. For a long time he was looked upon as an alchemist and sorcerer, though of late his discoveries have been more truly appreciated.

Baden-Powell, Lt.-Gen. Lord, O.M., G.C.M.G., G.C.V.O., K.C.B. (1857–1941), brilliant cavalry soldier, famous for his defence of Mafeking in the South African War. Founded the organisation of Boy Scouts (1908) and Girl Guides (1910) to promote good citizenship in the rising generation. Chief Scout of the World, 1921–41.

Baer, Karl Ernst von (1792–1876), Estonian biologist, founder of the science of embryology, and discoverer of the mammalian ovum.

Baffin, William (1584–1622), navigator and explorer who in 1616 discovered the bay which separates the north-east coast of British North America from Greenland, which bears his name.

Bagehot, Walter (1826–77), English economist and journalist. Editor of the *Economist*, 1860–77. Wrote three books of lasting importance, *The English Constitution*, 1867, *Physics and Politics*, 1872, and *Lombard Street*, a description of the Money Market, 1873. He was among the first to advocate the creation of Life Peers to strengthen the House of Lords.

Baird, John Logie (1888–1946), Scottish television pioneer; inventor of the televisor and the noctovisor.

Baker, Sir Benjamin, K.C.B., K.C.M.G., F.R.S.

(1840–1907), an eminent engineer. He was consulting engineer to the Egyptian Government for the Aswan Dam, joint engineer with Sir John Fowler of the Forth Bridge, and engineer of the Central London Tube Railway.

ker, Sir Herbert, K.C.I.E., R.A. (1862–1946) was an eminent architect who designed the Bank of England, Rhodes House, Oxford, and, with the late Sir E. Lutyens, New Delhi.

kst. Léon (1868–1924), Russian painter who designed scenery and costumes for the Russian Ballet of Serge Diaghilev.

lboa, Vasco Nuñez de (1475–1517), Spanish explorer, who was the first European to set eyes upon the Pacific Ocean.

ldwin of Bewdley, 1st Earl, K.G., P.C. (1867–1947), the leading Conservative politician between the two world wars and Prime Minister, 1923–24, 1924–29, and 1935–37.

ldwin, James (b. 1924), American Negro writer, regarded as the most significant of his time. Novels include *Go Tell It to the Mountain* (1953) and *Another Country* (1962).

lewa, Sir Abubakar Tafawa, K.B.E. (1912–1966), Federal Prime Minister of Nigeria, 1960–66; murdered during the crisis of January 1966.

lfour, Arthur James, Earl of, K.G., O.M., P.C. (1848–1930), statesman, scholar, and philosopher. Entered Parliament as a Conservative in 1874. Prime Minister, 1902–5. He also served as First Lord of the Admiralty under Asquith and as Foreign Secretary under Lloyd George. His most notable action was issuing the Balfour Declaration on Palestine.

lliol, John de, English baron whose widow in 1269 founded the college at Oxford which bears his name. Fought for Henry III, against Simon de Montfort. Died in exile in 1269.

liol, John (1249–1315), son of the above, competed with Robert Bruce for the Scottish throne, and Edward I. decided in his favour. Only reigned four years, when Edward deposed him, committing him to the Tower, and finally banished him from the country. He retired to Normandy. His son, Edward Baliol, recovered his father's kingdom in 1332, and was upheld by Edward III. whilst very unpopular by reason of his having given up the south of Scotland to the English. He renounced his title and throne in 1356, and retired to England on an annuity.

ll, John (d. 1381), English priest and a leader of the Peasants' Revolt, after which he was excuted. Author of the couplet *When Adam delved, and Eve span, Who was then the gentleman?*

lzac, Honoré de (1799–1850), one of the greatest of French novelists, and the author of over eighty novels to which he gave the covering title of *La Comédie Humaine*, depicting the appetites and passions of the new social class born of the revolution and Napoleon.

mpton, John (1689–1751), an eminent divine, who founded the Oxford Bampton Divinity lectures.

ncroft, Sir Squire (1841–1926), one of the best-known Victorian actor-managers.

ndaranaike, Hon. Solomon West Ridgway Dias, B.A. (1899–1959). Socialist Prime Min. of Ceylon from 1956 until his assassination in 1959. His widow, Mrs. Sirimawo Bandaranaike, became the world's first woman Prime Minister, 1960–65.

nks, Sir Joseph, Bt., F.R.S. (1743–1820), was president of the Royal Society for upwards of forty years. As a naturalist he was one of the most eminent men of his time, and encouraged science in every form. When Captain Cook made his voyage to the South Seas in 1768, Sir Joseph accompanied him for the purpose of observing the transit of Venus. He left very valuable botanical collections to the British Museum.

nting, Sir Frederick Grant, K.B.E., M.C., D.Sc., M.D., F.R.S. (1891–1941). Canadian physician and discoverer of insulin. Prof. of Medical Research, Toronto University, 1923–41.

ntock, Sir Granville, Mus. Doc.(1868–1946), Professor of Music at Birmingham University 1908–34; Chairman of Trinity Coll. of Music, London. He wrote songs, orchestral and choral music.

birolli, Sir John, F.R.A.M. (b. 1899), English conductor; succeeded Toscanini as conductor of the New York Philharmonic Symphony Orchestra, 1937–42; conductor of the Hallé Orchestra since 1943.

barossa (Red Beard), name given to Frederick I (*c.* 1122–90), greatest of the mediæval Holy Roman emperors who struggled (1159–77) to free the Empire from the domination of the Pope. The two brothers who were Barbary pirates also had this name: **Uruj** (*c.* 1482–1518) was killed by the Spaniards, and **Khaireddin** (*c.* 1482–1546) conquered Tunis for the Turks in 1534 and died in Constantinople.

Barbusse, Henri (1874–1935), noted French author and writer of the famous war novel *Le Feu*, which is one of the most remarkable and realistic of all war books, and portrays in a starkly vivid way the experience of the common soldier.

Barker, Dame Lilian, D.B.E. (1874–1955), governor of the Borstal Institution for Girls at Aylesbury. 1923–35; Ass. Comm. of Prisons, 1936–43.

Barnardo, Dr. Thomas John (1845–1905), the founder of the well-known homes for orphan-waifs, for some forty years devoted himself to the protection, education and advancement of destitute children.

Barrie, Sir James Matthew, Bt, O.M. (1860–1937), popular Scottish author and playwright. Among his novels are *A Window in Thrums* and *The Little Minister*, while his plays include *Quality Street*, *The Admirable Crichton*, *Dear Brutus*, *Mary Rose*, *Shall We join the Ladies?* and the children's classic, *Peter Pan*. His work is clever and entertaining and is tinged with mysticism.

Barrow, Isaac (1630–1677), a famous divine, mathematician, Greek scholar, and tutor of Sir Isaac Newton. His "Sermons" are amongst the finest in the language.

Barry, Sir Charles, R.A. (1795–1860), architect of the Houses of Parliament at Westminster which took twenty years to build. Knighted in 1852, and buried in Westminster Abbey. His son:

Barry, Sir John Wolfe Wolfe-, K.C.B., F.R.S. (1836–1918), an eminent engineer, designed and carried out some of the most prominent undertakings of the time, including Barry Dock and Tower Bridge.

Barth, Karl (b. 1886), Swiss theologian, one of the leading Protestant thinkers of the 20th century, described by the late Pope John as a Protestant St. Thomas Aquinas.

Bartók, Bela (1881–1945), Hungarian composer, one of the great figures in the music of his century. From an early age deeply interested in folk-song which inspired him in his researches into Hungarian and Rumanian peasant music. His compositions include string quartets, violin sonatas, concertos, orchestral music, a ballet and an opera, and a collection of over 7,000 melodies. Professor at Budapest Conservatory, 1907–12, when he retired into private life as a result of the opposition his compositions aroused. *See* Section E.

Bartolommeo, Fra (1469–1517), the distinguished Florentine painter and friend of Savonarola, at whose death he became a monk.

Bartolozzi, Francesco, R.A. (1727–1815), a Florentine engraver who came to London in 1764 where he became one of the original members of the Royal Academy. He produced an enormous number of engravings and was responsible for the stipple technique.

Baruch, Bernard Mannes (1870–1965). American economist. Assisted U.S. Government in both world wars, and in 1946 was chairman of the United Nations Atomic Energy Commission.

Bashkirtseff, Marie (1860–84), Russian painter and writer of a famous autobiographical diary.

Bassi, Agostino (1773–1856), Italian amateur microscopist who first suggested that infectious diseases might be caused by the invasion of the body by micro-organisms.

Batten, Jean Gardner, C.B.E. (b. 1909) the famous New Zealand airwoman who made aviation history by her record solo flight from England to Australia in 1934.

Baudelaire, Charles Pierre (1821–67), French poet of startling originality and great sensitivity, best known for his book of verse *Les Fleurs du Mal*, also a brilliant critic. He was inordinately attached to his mother and allowed his life to be ruined by poverty, despair, and ill-health.

Bax, Sir Arnold Edward Trevor, K.C.V.O., F.R.C.M., F.R.A.M. (1883–1953), Master of the King's Musick, 1942–52; Master of the Queen's Musick, 1952–53. His work includes numerous piano compositions, songs, and chamber works.

Baxter, Richard (1615–91), a great Nonconformist divine, remarkable for the ability and boldness of his writings.

Bayard, Pierre du Terrail, Chevalier de (1475–1524), a French knight of exemplary conduct and remarkable for his chivalry. Fell at the Battle of Sesia, and was named "Le Chevalier sans peur et sans reproche."

Baylis, Lilian Mary, C.H. (d. 1937), manager of the Old Vic theatre from 1898 and of Sadler's Wells from 1931. Did great work for the British stage.

Beaconsfield, Benjamin Disraeli, Earl of, K.G., P.C. (1804–81). Son of Isaac D'Israeli (*q.v.*). Statesman and novelist; with Burke (*q.v.*) exercised most influence on Conservative political theories. His first novel, *Vivien Grey*, published when he was only twenty-one, was a brilliant success and the author was able to enter Society. *Coningsby* and *Sibyl*, published twenty years later, helped to rouse the social conscience to the evils of industrial life and of the deplorable relations existing between rich and poor (the "two nations"). Disraeli entered Parliament in 1837, but had only short periods of office before his terms as Prime Minister in 1868 and 1874–80. The second period was marked by the purchase of the Suez Canal shares, by the conferment on the Queen of the title, Empress of India, and by a diplomatic triumph at the Congress of Berlin, abroad, and by a continuation of measures for social reform, at home. He was a gifted orator, the rival and antithesis of Gladstone and the friend of Queen Victoria, who favoured his policies, honoured his wife, and called him "Dizzy."

Beardsley, Aubrey Vincent (1872–98), black-and-white artist, whose illustrations in the *Yellow Book* aroused much controversy.

Beatty, 1st Earl, Admiral of the Fleet, P.C., G.C.B., O.M., G.C.V.O., D.S.O. (1871–1936). First Sea Lord, 1919–27. From 1912 to 1916 Commander of Battle Cruiser Squadron. From Nov. 1916 to 1919 succeeded Lord Jellicoe as Admiral of the main British Fleet. On Aug. 28, 1914, fought the German fleet in the Heligoland Bight. On May 31, 1916, Lord Beatty with his battle cruisers was engaged in a great sea fight with the Germans off Jutland, for which he was granted £100,000 and an Earldom in 1919.

Beaumont, Francis (1584–1616), and **Fletcher, John** (1579–1625), joint authors of many plays, including *The Maid's Tragedy* and *Philaster*. Beaumont was buried in Westminster Abbey, and Fletcher interred in St. Saviour's, Southwark. Thought by some to be authors of plays attributed to Shakespeare.

Beaverbrook, 1st Baron (William Maxwell Aitken) (1879–1964), British newspaper owner and politician, a Canadian by birth. A man of tremendous energy and will-power, he rendered great service as Minister of Aircraft Production in the crucial years, 1940–1. He controlled the *Daily Express*, *Sunday Express*, and *Evening Standard* which sponsored his various political campaigns, notably the Empire Free Trade Movement. Known affectionately as "Max" or "The Beaver."

Becket, Thomas (1118?–70), saint and martyr, Archbishop of Canterbury under Henry II. A powerful and ambitious prelate who boldly supported the authority of the Pope against the dictates of the King, and was assassinated in Canterbury Cathedral December 29th, 1170, being canonised two years later.

Becquerel, Antoine Henri (1852–1908), French physicist who in 1896 discovered radioactivity in uranium. Shared with the Curies the 1903 Nobel Prize in Physics.

Bede, "The Venerable" (673–735), a monk of great influence and ability whose historical works cover a great range and are valuable in the outline they give of the early history of this country.

Beecham, Sir Thomas, Bt., C.H. (1879–1961), conductor and impresario. Founded the London Philharmonic Orchestra in 1931; introduced into England the operas of Richard Strauss, Russian operas, and the Diaghilev ballet; championed the music of Delius. Recognised as one of the world's greatest conductors, especially in the interpretation of Mozart and Wagner. Conductor of the Royal Philharmonic Orchestra (1946). Pub. Frederick Delius biography (1959); Memoirs: *A Mingled Chime*.

Beecher, Henry Ward (1813–1887), an eminent American preacher and lecturer, whose church at Brooklyn was for many years the most popular in the United States. Brother of Mrs. H. B. Stowe.

Beerbohm, Sir Max (1872–1956), brilliant critic and caricaturist who contributed to the *Saturday Review* during his "twelve years' bondage to dramatic criticism" (1898–1910).

Beethoven, Ludwig van (1770–1827), one of the world's greatest musicians and composers, born at Bonn of a poor but musical family, his father being a tenor singer in the service of the electoral prince at Bonn. As a child he was already remarkable for his playing of the harpsichord and violin and for his power of extemporization. Some of his compositions, sonatas, songs and pianoforte variations were published when he was only 13. At 17 he visited Vienna and played before Mozart who promptly recognised his genius. When he was about 30 he began to suffer from the worst malady that could possibly have befallen him: he became deaf. He faced his fate with indomitable courage and perhaps more than any other artist continued to develop until he reached the loftiest pinnacle of musical fame. Between the years 1805 and 1808, Beethoven composed some of his greatest works: the oratorio *Mount of Olives*, the opera *Fidelio*, and the *Pastorale* and *Eroica* symphonies besides a number of concertos, sonatas and songs. He composed four overtures to *Fidelio* at different periods: *Leonore No. 2* (1805), *Leonore No. 3* (1806), *Leonore No. 1* (1807) and *Fidelio* (1814). The *Mass in C* was first performed in 1810 and the *Mass in D* was written between the years 1819 and 1822. The symphonies, nine in number, rank as the greatest ever written and the pianoforte sonatas and string quartets are unequalled in beauty. He died at Vienna at the age of 56. *See* Section E.

Behring, Emil von (1854–1917), German bacteriologist and father of the science of immunology. Awarded Nobel Prize in 1901.

Behring, Vitus (1680–1741), Danish navigator who entered the Russian service and in 1728 discovered Behring's Strait, afterwards being wrecked on Behring's Island, where he died.

Belisarius (505–565), brilliant Roman general under Justinian, famed for his campaigns against the Vandals, Ostrogoths, and Persians.

Bell, Alexander Graham, (1847–1922), born in Edinburgh, emigrated to Canada in 1870 and in 1871 lectured in Boston, mainly to teachers of the deaf, later becoming an American citizen. In 1876 exhibited an invention which was developed into the telephone. Invented the photophone, and devoted much attention to the education of deaf-mutes.

Bell, Gertrude Margaret Lowthian, C.B.E. (1868–1926), the "uncrowned Queen of Arabia," was a famous traveller in the East, especially in Arabia.

Bellamy, Edward (1850–1898), American journalist and author of *Looking Backward*, a utopian novel in which he foretells of many changes that have since come to pass.

Bellini, a celebrated family of Venetian painters of the Early Renaissance: **Jacopo** (*c.* 1400–70) and his two sons **Gentile** (1429–1507), whose works include the *Adoration of the Magi* (National Gallery), and **Giovanni** (*c.* 1429–1516), the most important painter of the 15th cent., brother-in-law of Mantegna, and teacher of Giorgione and Titian.

Bellini, Vincenzo (1801–35), Italian operatic composer; born in Sicily, the son of an organist. His graceful vocal melodies were much admired by his friend Chopin and he enjoyed successes in Paris and London. His best-known operas are *I Capuleti ed i Montecchi*, *La Sonnambula*, *Norma*, and *I Puritani*.

Belloc, (Joseph) Hilaire (Pierre) (1870–1953), a writer of great versatility whose works include *The Bad Child's Book of Beasts*, *The Path to Rome*, *Hills and the Sea*, *Cautionary Tales*, and historical studies of Danton, Robespierre and Richelieu.

Belzoni, Giovanni Battista (1778–1823), a renowned explorer of Egypt who settled in England at the beginning of the 19th century. After a precarious existence began to turn his attention to hydraulic experiments, and went to Egypt with a view to getting the Government to sanction a scheme of his for raising the water of the Nile. He was then attracted to the study of Egyptian antiquities, and engaged in highly successful researches.

nedict, St. (c.480 – c.543), b. at Nursia near Spoleto, in Umbria; founded twelve monasteries, and the Order of Benedictine Monks, at Monte Cassino, near Naples. Here he wrote his celebrated Rule, a unique document of wide application. (*See* **Monasticism, J30**).

nes, Dr. Eduard (1884–1948), Czechoslovak statesman; co-founder with Thomas Masaryk of the Czech Republic; Foreign Minister, 1918–35, and President 1935–38 and 1940–48. An all-party ministry was overthrown by a communist *coup d'état* in February 1948, and Benes, in failing health, resigned the Presidency in June, dying in September.

navente y Martinez, Jacinto (1866–1954), one of the greatest of Spanish dramatists. Author of *Los Intereses Creados* and other famous plays. Nobel Prizewinner, 1922.

n-Gurion, David (b. 1886), Zionist leader. Educated at Istanbul University. Helped to organise the Jewish Legion in 1918, and was prominently connected with the Labour movement in Palestine in between the world wars. Prime Minister of Israel, 1948–63.

nnett, Enoch Arnold (1867–1931), author and journalist. His stories of the Pottery Towns, where he was brought up, are of high merit. *The Old Wives' Tales*, *Clayhanger*, and *Hilda Lessways* are among his most successful novels. He also wrote plays, including *Milestones*, *The Great Adventure*, and *Mr. Prohack*.

nnett, James Gordon (1841–1918), proprietor of the *New York Herald*, and a famous yachtsman and motorist. He sent out Stanley on the expedition which resulted in the finding of Livingstone.

nnett, Sir William Sterndale (1816–1875), English composer best known for his oratorio *The Woman of Samaria*. Schumann pronounced him to be "a thorough Englishman, a glorious artist, and a beautiful and poetic soul."

ntham, Jeremy (1748–1832), the founder of the school of political philosophy, the tenets of which were extended by John Stuart Mill. His works on *Government*, *Usury*, and *The Principles of Morals and Politics*, expound the Utilitarian system with great lucidity.

ntley, Richard (1662–1742), an eminent classical scholar and critic, for long Master of Trinity College, Cambridge. He was a formidable controversialist and did pioneer work in textual criticism.

nz, Karl (1844–1929), German engineer whose motor car produced in 1885 was one of the first to be driven by an internal-combustion engine.

ranger, Jean Pierre de (1780–1857), was the most popular song writer that France has produced. His songs were often written to serve some passing political purpose, and were invariably in harmony with popular sentiment.

resford, William Carr Beresford, Viscount (1768–1854), British General. Participated in capture of Cape Colony and of Buenos Aires. Reorganised Portuguese Army. Master-General of Ordnance in Wellington administration.

rg, Alban (1885–1935), Austrian composer whose best known work is the three-act opera *Wozzeck*, based upon a drama by Büchner (*q.v.*), which has become a modern classic.

rgson, Henri Louis (1859–1941), French philosopher, exponent of the theory of vitalism and he life force. Member of French Academy, 1941; Nobel Prize for Literature, 1927. Author of *Matter and Memory* (1896) and *Creative Evolution* (1907).

riot, Charles Auguste de (1802–70), Belgian violinist, whose first wife was the great operatic contralto Malibran. His son Charles Wilfrid de Bériot (1833–1914) was a fine pianist and the eacher of Ravel.

rkeley, George, D.D., Bishop of Cloyne (1685–1753), the propounder of the philosophy that the only things that are real are our ideas of what s presented to our senses. In support of this philosophy he wrote several works of great ngenuity of argument, chief amongst them being his *Alciphron, or the Minute Philosopher*.

Berlin, Irving (b. 1888), American composer of popular songs, and the pioneer of both ragtime and jazz music; his songs including *Alexander's Rag-time Band*, *Always*, *What'll I Do?* were the beginning of popular jazz.

Berlioz, (Louis) Hector (1803–69), composer, born in S.E. France, the son of a country doctor; eccentric, highly-endowed, he was the greatest figure in the French romantic movement. His outstanding dramatic works are *La Damnation de Faust* and the *Roméo et Juliette* symphony. His first wife was an Irish actress, Harriet Smithson, for whom he formed a romantic attachment while she was appearing in Shakespearean parts in Rome.

Bernadotte, Count Folke (1895–1948), nephew of the late King Gustav of Sweden. As head of the Swedish Red Cross arranged for the exchange of prisoners in the second world war. In April 1945, he was the intermediary through whom Himmler attempted to capitulate. Appointed United Nations mediator for Palestine in 1947 and brought about a truce between the Arabs and Jews, but was assassinated by Jewish terrorists.

Bernadotte, Jean Baptiste (1764–1844), was a French commander of great distinction who served under Napoleon, and in 1810 was chosen heir to the throne of Sweden. In 1818 he succeeded as Charles XIV., and was a capable ruler.

Bernal, John Desmond, M.A., F.R.S. (b. 1901). Professor of Physics, Birkbeck College since 1938. Author of *Science in History*, *The Physical Basis of Life*, *The Origin of Life*, and of many other works on scientific and social subjects, notably crystallography, poison gases, and post-war housing.

Bernard of Menthon (923–1008), patron saint of mountaineers. Founded the alpine hospices of Saint Bernard on the famous Great Saint Bernard Pass between Switzerland and Italy.

Bernard, Saint, of Clairvaux (*c.* 1090–1153), famous French abbot of the monastery of Clairvaux whose sermons and letters had very great influence in Western Europe.

Bernhardt, Sarah (1845–1923), the most renowned tragedienne of her time. Became a member of the Comédie Francaise after the Siege of Paris, and thereafter occupied a specially prominent position as an actress. Her first performance in London was in 1879. Among her most conspicuous successes are *Théodora*, *Fédora*, and *La Tosca*, while she also appeared as Hamlet with distinction.

Berthelot, Marcellin Pierre Eugène (1827–1907), French chemist and politician, and the first to produce organic compounds synthetically.

Berzelius, Jöns Jakob (1779–1848), Swedish chemist, whose researches laid the foundations for modern chemical science. He devised the system of chemical symbols in use today and discovered several elements.

Bessemer, Sir Henry, F.R.S. (1813–1898), famous for his invention of the well-known process of converting cast-iron direct into steel. His invention entirely revolutionised steel manufacture, greatly reducing the cost of production and making it possible to utilise steel in many directions where previously iron only had been used.

Bevan, Rt. Hon. Aneurin, M.P. (1897–1960). British socialist politician of remarkable genius; architect of the National Health Service which came into operation in 1948. M.P. for Ebbw Vale, 1929–60; Min. of Health, 1945–51; Min. of Labour, Jan.–Apr. 1951. (*See also* **C5**.)

Beveridge, Lord, K.C.B. (1879-1963), British economist. Director of the London School of Economics, 1919–37, and Master of University College, Oxford, 1937–44. Drew up the Beveridge Plan, published in 1942, which formed the basis of the present Health and Insurance Schemes.

Bevin, Rt. Hon. Ernest, M.P. (1881–1951), Secy. of State for Foreign Affairs 1945–51; Minister of Labour and National Service, 1940–45. A British Trade Union Leader who became prominently associated with the Dockers Union, of which he was Assistant General Secretary and of the Transport and General Workers Union of which he was still General Secretary when he entered the Coalition Government as Minister of Labour. He was Chairman of the General Council of Trades Union Congress, 1937.

Bichat, Marie François Xavier (1771–1802), French physiologist and anatomist whose study of tissues founded modern histology. His theory was that life is "the sum of the forces that restrict death."

Biddle, John (1615–62), the first English Unitarian. He was fined, imprisoned and banished for his publications attacking the Holy Trinity. Under a general Act of Oblivion in 1652 he resumed his teachings, which led to further imprisonment, and as a result he died of fever.

Binyon, (Robert) Laurence, C.H. (1869–1943), English poet, art critic, and authority on Oriental art, keeper of prints and drawings at the British Museum.

Birch, (Samuel John) Lamorna, R.A. (1869–1955), English landscape painter in oils and water-colours, well known for his charming Cornish landscapes and sea studies. His pictures are hung in all the principal galleries of England.

Birkbeck, George (1776–1841), physician, philanthropist, and philosopher. A Yorkshireman who settled in London in 1804, and became the chief founder of Mechanics' Institutes.

Birkenhead, 1st Earl of, P.C., G.C.S.I. (1872–1930), Sec. for India, 1924–1928. Lord Chancellor, 1919–1922. Attorney-General 1915 to 1919. M.P. for the Walton Divn. of Liverpool from 1906 to 1918, and West Derby Divn. thereof from Dec. 1918 to Jan. 1, 1919.

Birkett, 1st Baron (William) Norman, Q.C. (1883–1962), great English advocate; Lord Justice of Appeal, 1950–7; Judge King's Bench Div. 1941–50; British Mem. (Deputy) Int. Mil. Tribunal at Nuremberg 1945–46; M.P. (L.) for East Nottingham, 1923–24 and 1929–31.

Bishop, Sir Henry Rowley (1786–1855), composer of many popular ballad operas and songs. *Maid Marian*, *Guy Mannering* and *The Miller and his Men*, are his best-known operas. He was also a very successful glee-writer, and was the composer of *Home, Sweet Home.* Was the first musician to be knighted in 1842.

Bismarck, Otto Eduard Leopold von, Prince Bismarck, Duke of Lauenburg (1815–98), Prusso-German statesman, chief architect of the German empire. Of Junker family he began his diplomatic career in 1851 when he was appointed Prussian member of the revived German Diet of Frankfurt. Prussian ambassador at St. Petersburg (1859–62), where he gained the confidence of the new Tsar (Alexander II), and at Paris (1862), where he had the opportunity of studying Napoleon III. Recalled to Germany by William I to head his government, from which time dates the autocratic rule which was ultimately to prove so disastrous for Germany and the world. There followed the events which led to the victory over Austria in 1866, the humiliation of France in 1871 culminating in William I being proclaimed emperor of Germany at Versailles. From 1871 until the death of William I in 1888 the rule of the "iron chancellor" dominated Europe and German domestic affairs. A struggle for supremacy developed between Bismarck and William II which ended (1890) in the "old pilot" being dropped, to use a figure of speech made memorable by one of Tenniel's cartoons. Bismarck retired to his country estates to spend the rest of his life in criticism of the emperor.

Bizet, Georges (1838–75), properly Alexandre César Léopold, French composer who gave the operatic stage several operas full of charming melody and whose immortal *Carmen* from the story by Mérimée was his greatest achievement. He also wrote some orchestral works, piano music, and songs. He died too young to enjoy popularity.

Björnson, Björnstjerne (1832–1910), the Norwegian poet, dramatist, and novelist is one of the great names in modern European literature, his poems, plays, and stories being marked by a strong intellectuality and a rich imagination.

Black, Joseph (1728–99), Scottish chemist. Prof. of anatomy at Glasgow (1756–60) and of medicine and chemistry at Edinburgh (1760). Specially known for discoveries of carbon dioxide (he called it "fixed air") and latent heat. His original work earned him the title father of quantitative chemistry.

Blackett, Patrick Maynard Stuart, C.H., F.R.S. M.A. (b. 1897), British scientist; Prof. o Physics, Imperial College of Science and Tech nology, 1953–64, Manchester University, 1937–52. Author of *Military and Political Con sequences of Atomic Energy* (1948). Awarde 1948 Nobel Prize for his work in nuclear an cosmic ray physics. His studies also includ operational research and magnetism. Pres British Association, 1957; Pres. Royal Society 1966.

Blackmore, Richard Doddridge (1825–1900), novelist who in 1869 made a great reputatio with his romantic story of *Lorna Doone.*

Blackstone, Sir William (1723–1780), was a Justic of the Court of Common Pleas. His great work *Commentaries on the Laws of England*, becam one of the British classics.

Blackwood, Algernon, C.B.E. (1869–1951), Britis author. As a young man, farmed in Canad and worked on New York newspapers. Then from 1906, produced a steady flow of books plays, and short stories of high quality.

Blair, Robert (1699–1746), a noted Scottish poet whose poem, *The Grave*, entitles him to a plac in all collections of British poetry.

Blake, Robert (1599–1657), Parliamentary genera and an admiral in the Cromwellian navy in th Dutch and Spanish wars.

worked for William Morris making cartoons f
textiles. He was regarded as the greate
mural artist and etcher of his day.

Breakspear, Nicholas. *See* **Adrian IV.**

Brecht, Bertold (1898–1959), German dramati
and poet, whose cynical and satirical works a
characteristic of the period between the tw
world wars. He left Germany in 1933 f
Russia, went to the United States in 1941, an
returned to E. Germany after the war. H
plays include *Die Dreigroschenoper* (with mus
by Kurt Weill). *See also* **Modern Drama.**

Brennan, Louis, C.B. (1853–1932), successf
inventor, born in Ireland. Paid £120,000 b
the British Government for his gyro-directe
torpedo; also the inventor of a mono-ra
locomotive on the gyroscope principle

Breton, Andrée (1896–1966), French poet, found
of the surrealist literary movement in Fran
and a close friend of Apollinaire.

Brewster, Sir David, LL.D., F.R.S. (1781–1868
Scottish physicist, a great experimenter and
prolific writer. Noted for his researches in
the polarisation of light; invented the kaleid
scope Helped to found the British Associati
for the Advancement of Science.

Brezhnev, Leonid Ilyich (b. 1906), succeede
Nikita Khrushchev as First Secretary of th
Soviet Communist Party in Oct. 1964; former
President of the Supreme Soviet of the U.S.S.

Bridges, Edward, 1st Baron, K.G., G.C.
G.C.V.O., P.C., M.C. (b. 1892), son of Robe
Bridges. Permanent Secretary to the Treasu
and Head of Civil Service, 1945–56. Secreta
to the Cabinet, 1938–46. Chanc. Readi
Univ., 1959. Chairman British Council, 1959

Bridges, Robert, O.M., M.A. (1844–1930), was Po
Laureate 1913–30. Practised medicine up
1882, thenceforward devoting himself mainly
literature. He published several volumes
poems and plays, displaying refined fancy a
a broad philosophic spirit. His *Testament*
Beauty was published in 1930.

Butt, Dame Clara, D.B.E. (1873–1936), the famou English contralto, made her début in London i 1892. She married Kennerly Rumford in 1900

Buxton, Sir Thomas Fowell, 1st Bart. (1786–1845) a philanthropist and zealous advocate of th abolition of slavery.

Byrd, Rear-Admiral Richard Evelyn (1888–1957) famous American aviator and Polar explorer Was in command of the Macmillan Arctic Expedition, 1925; flew over the North Pole, 1926 with three companions flew across the Atlantic 1927, and in 1929 made the first flight over th South Pole. Discovered Edsel Ford mountains and Marie Byrd Land on his first expedition to the Antarctic, 1928–30. He made second expedition in 1933–5, a third in 1939 and a fourth in December 1946.

Byrd, William (1543–1623), English writer of keyboard music and the greatest musician of th 16th century. He wrote church music, sacre choral music, string music, vocal and instrumental music, and founded the school of English madrigalists. He was organist of Lincol Cathedral at 20 and later of Queen Elizabeth' Chapel Royal. *See* Section E.

Byron, George Gordon, 6th Lord (1788–1824), wa the poet who exercised the greatest influenc upon European thought during the early par of the 19th century. Educated at Harro and Cambridge, he published his *Hours o Idleness* at twenty, a volume which wa violently attacked by the *Edinburgh Revie*

hich provoked his retaliatory *English Bards*
nd Scotch Reviewers, which caused a great
ensation because of its unsparing criticisms of
he writers of the day. His *Childe Harold's*
Pilgrimage, the first two cantos of which
ere published in 1812, at once placed him
the front rank of poets, and thenceforward to
he time of his death he continued to produce
oems, most of which were marked by an
tense Republican sentiment, yet full of passion
nd charm and beauty. He made an unhappy
arriage in 1815 with the daughter of Sir
alph Milbanke, from whom he parted after
twelvemonth. He lived abroad for the rest
f his life and died at Missolonghi, whither he
ad proceeded with a view to aiding the
reeks in their battle for national indepen-
ence.

C

e, George Washington (1844–1925), a well-
nown American author, born in New Orleans,
e scene of many of his best works. Among
s writings were *Ole Creole Days* (1879), *Strange*
ories of Louisiana (1889), and serious socio-
gical studies such as *The Negro Question*
890).

t, John (*c.* 1455–*c.* 1498), Genoese explorer
ho settled in Bristol and sailed westwards
der letters-patent from Henry VII of England
1497. Discovered Newfoundland and Nova
otia, believing them to be part of Asia, and
ay have reached the mainland of America
fore Columbus did. His son:—

t, Sebastian (*c.* 1483–1557) was born in Venice,
d in 1509 sailed in search of a north-west pas-
ge to Asia. Sailed as far as the entrance of
udson Bay. Entered Spanish service in 1512,
d in 1518 was appointed chief pilot. Spent
veral years exploring the Plate and Parana
vers. Re-entered English service in 1548 and
ganised expedition to seek a north-east pas-
ge to open up trade with India, which resulted
trade with Russia. English claim to North
merica is founded on the voyages of the
bots.

al, Pedro Alvarez (*c.* 1467–*c.* 1520). Portuguese
vigator, friend of Vasco da Gama, and dis-
verer of Brazil, which he named "Terra da
nta Cruz."

ury, George (1839–1922), was a prominent
ember of the Society of Friends, a well-known
ilanthropist, and ardent Liberal, and head
the firm of Cadbury Bros., Bourneville. He
ok the lead in the Garden City project, and

He exhibited at the Royal Academy and was elected Academician Extraordinary in 1948. Hon. American citizenship conferred, 1963. Awarded Nobel Prize for Literature in 1953.

hulalongkorn, Phra Paramindr Maha (1853–1910), great Siamese monarch whose appreciation of foreign institutions inspired him to carry out many reforms in his country.

bber, Colley (1671–1757), a London actor and dramatist of great repute in his day. *The Careless Husband*, and *Love's Last Shift* are the best of his comedies. Poet Laureate 1730–57.

cero, Marcus Tullius (106–43 B.C.), a Roman Republican orator and philosopher. His younger brother, Quintus Tullius Cicero (102–43 B.C.), was a Roman soldier of some note. Both were slain.

d (El Campeador) (*c.* 1035–1099), the name given to the famous Spanish knight, Rodrigo Diaz, Count of Vivar, whose exploits in battle and adventure made him the national hero. He drove the Moors out of Spain before he had completed his twentieth year.

erva, Juan de la (1895–1936), the Spanish engineer who invented the autogiro.

mabue, Giovanni (1240–1302), a Florentine painter whose real name was Cenni di Pepo, master of Giotto, and the leader of the movement which led to the formation of what is called the Florentine school.

marosa, Domenico (1749–1801). One of the earliest Italian composers whose works in his time were as popular as they were numerous. Was composer to the Russian Court from 1789 to 1792. His most popular opera during his lifetime was *Il Matrimonio Segreto*, and it is still to-day the most frequently heard of his works.

non (*c.* 507–449 B.C.), Athenian statesman and general, son of the great Miltiades who commanded at Marathon. He worked for friendship with Sparta to unite forces against Persia. Decisively defeated Persian land and sea forces at the mouth of the Eurymedon in 468 B.C. Died at the siege of Citium, in Cyprus.

Cipriani, Giovanni Battista (1727–85), Florentine painter and engraver who worked in London and was one of the foundation members of the Royal Academy. Collections of his pen-and-ink drawings are in the British Museum and Victoria and Albert Museum.

Citrine, 1st Baron P.C., G.B.E. (b. 1887), English trade-union official who rose to a prominent position in the Electrical Trades Union, of which he was Asst. Gen. Sec., 1920–23; Pres. Int. Fed. of Trade Unions, 1928–45; Gen. Sec. Trades Union Congress, 1926–46; Mem. Nat. Coal Board, 1946–47; Chair. Central Electricity Authority, 1947–57.

Clair, René, (b. 1898), French film producer, whose early films, full of wit and satire, included *Sous les Toits de Paris* and *A Nous la Liberté*.

Clarendon, Edward Hyde, 1st Earl of (1609–1674), a statesman of great ability who filled the office of Lord High Chancellor under Charles II., and for a time was in high favour but, refusing to pander to Charles's whims, was dismissed and went to live in retirement. His *History of the Rebellion* is a valuable work, having the advantage of being written by one who was a witness of, and often an important figure in, the events described. His daughter Anne was the wife of the Duke of York, afterwards James II., and it was her daughter who became Queen Anne. Clarendon died in exile at Rouen.

Clark, Sir Kenneth McKenzie, C.H., K.C.B. (b. 1903), British art critic. Director, National Gallery, 1934–45; Chairman Arts Council of Great Britain, 1953–60; Chairman, Independent Television Authority, 1954–57. His broadcasts on art and architecture are much enjoyed.

Clark, Sir Wilfred Edward le Gros, M.A., M.D., D.Sc., F.R.C.S., F.R.S. (b. 1895), anatomist and anthropologist; Prof. of Anatomy, Oxford Univ., 1934–62; one of the scientists to expose the forgery of the Piltdown skull. Pres. British Association, 1961.

Clarke, Marcus Andrew Hislop (1846–81), Australian novelist, born in London. Emigrated to Australia in 1863, where he became a journalist. During his stay in Tasmania he wrote *For the Term of his Natural Life*, which has become a minor classic.

Clarkson, Thomas (1760–1846), was one of the leaders of the Negro Emancipation movement, to which he devoted the main part of his life.

Claude Lorrain (1600–1682), the most famous landscape painter of his century. His real name was Claude Gelée, and he was born at Chamange in the Vosges, going from France to Rome as a lad and there laying the foundation of his worldwide celebrity. He lived in Rome most of his life.

Claudius I. (10 B.C.–A.D. 54), Emperor of Rome, who succeeded his nephew Caligula when he was murdered. He was the grandson of Tiberius Claudius Nero, erected many imposing buildings in Rome, and visited Britain. In his later years he became the tool of favourites, and was poisoned by his wife Agrippina.

Clausewitz, Gen. Carl von (1780–1831), Germany's greatest military expert. His classic book *Vom Kriege*, which expounds his theories on war, dominated Prussia in the nineteenth century, and is still studied in military schools throughout the world.

Clemenceau, Georges Eugène (1841–1929), a prominent French statesman and editor of strong Radical tendencies who supported General Boulanger for a time and then bitterly opposed him. Was still a leading exponent of French Radicalism, though he sacrificed his independent position to become Premier and Minister of the Interior in October, 1906–1909, Prime Minister and Minister for War, France, 1917–20. Was a great orator, and a sturdy defender of Dreyfus.

Clemens, Samuel Langhorne ("Mark Twain") (1835–1910). After the Civil War drifted into journalism, making himself popular as a humorist in 1869 by his *Innocents Abroad*, the result of a trip to Europe. His other works include *A Tramp Abroad*, *Tom Sawyer*, *Huckleberry Finn*, and *Pudd'nhead Wilson*.

Cleopatra (69–30 B.C.), daughter of Ptolemy XI, the sixth queen of Egypt by that name, a brilliant, ambitious woman of captivating charm. On the death of her father in 51 she became joint sovereign with her younger brother Ptolemy XII, whom she married in accordance with Egyptian custom. She was banished to Syria, but obtaining the help of Cæsar, led a revolt and won the kingdom for herself. Cleopatra and Cæsar became lovers. In 47 she bore him a son Cæsarion (later Ptolemy XIV) and followed him to Rome. After the murder of Cæsar she returned to Egypt, where in 41 she was summoned to meet the triumvir Mark Antony. He fell in love with her and became enslaved. She bore him twins Alexander Helios and Cleopatra Selene. He deserted Octavia his wife and broke with Octavian (later Augustus), his brother-in-law, in an attempt to re-establish the power of Egypt. Antony and Cleopatra were, however, defeated at Actium in 31 B.C. and at Alexandria. Antony fell upon his sword, and Cleopatra, unable to influence Octavian, killed herself by allowing an asp to bite her. The drama of her life has been described by Shakespeare in *Antony and Cleopatra* and by Shaw in *Cæsar and Cleopatra*.

Clive, Robert, Lord (1725–1774), went out to India as a clerk in the service of the East India Company when 17, and during the diplomatic difficulties which arose between England and France attracted the attention of his superiors by some able suggestions for the curbing of the French influence. In the war that followed he was given a command and displayed such remarkable military genius that he virtually became Commander-in-Chief. In the troubles that followed with the native rulers, he was equally resourceful, and succeeded in laying the foundation of the British empire in India on a secure basis. On his return to England in 1760 he was raised to the peerage. His latter years were marked by mental disturbance and ultimately he committed suicide.

Clovis (*c.* 465–511) was the founder of the Merovingian-line of Frankish kings, and a convert to Christianity. He defeated the Burgundians and West Goths, and fixed his court at Paris.

Clyde, 1st Baron, Colin Campbell, K.C.B. (1792–(1863), a British Field-Marshal who served in the Peninsular and Crimean wars and made a great reputation as Commander-in-Chief in India during the Mutiny.

Cobbett, William (1763–1835), a politician and controversialist, who, through the medium of his *Political Register*, attacked both Radical and Tory in turn. Entered Parliament in 1832. In 1830 his *Rural Rides* were published in book form.

Cobbold, 1st Baron, Cameron Fromanteel, P.C., G.C.V.O. (b. 1904), Governor of the Bank of England, 1948–61; Lord Chamberlain, 1962– .

Cobden, Richard (1804–1865), the son of a Sussex farmer, who afterwards became a commercial traveller, and during the Corn Law Agitation came into great prominence as an advocate of Free Trade. He devoted himself so completely to this cause, that for some years he entirely neglected his business affairs and in recognition of his services a subscription of £80,000 was raised for him in 1845, and in 1860 a further sum of £40,000. He entered Parliament in 1841, and except for an interval of two years remained a member till his death. In 1860 he negotiated a commercial treaty with France which was of great benefit to the trade of this country. Titles and other honours were offered to him but declined.

Cochran, Sir Charles Blake (1872–1951), a prominent English theatrical manager and producer who began as an actor in America. Among his many successes were *Bitter Sweet*, *Cavalcade*, and a number of brilliant revues.

Cockcroft, Sir John Douglas, K.C.B., O.M., C.B.E., M.A., Ph.D., F.R.S. (b. 1897), Cambridge nuclear physicist who shared with Dr. E. T. S. Walton the 1951 Nobel Prize. Dir. Atomic Energy Research Estab. at Harwell, 1946–58; Member (Research) U.K. Atomic Energy Authority, 1958–59, Part-time Member Advisory Council on Scientific Policy; Master of Churchill College, Cambridge.

Cocteau, Jean (1891–1963), French writer and artist whose achievements in widely varied forms of art were prodigious. Elected to the Académie Française in 1955.

Cody, Samuel Franklin (1861–1913), American aviator whose name is associated with flights at Farnborough, Hampshire, England. He was the first man to fly in Britain (1,390 feet on 16 Oct. 1908). He became a British subject in 1909. Killed while flying.

Cody, William Frederick (1846–1917), American showman, known as "Buffalo Bill," who in 1883 founded his great Wild West Show with which he toured America and Europe for many years.

Cohn, Ferdinand Julius (1828–1898), the famous German bacteriologist, of which science he was the virtual founder.

Coke, Sir Edward (1552–1634), Attorney-General under Elizabeth and Chief Justice under James I; great rival of Francis Bacon. His extensive legal erudition added many new interpretations to the Common Law system. Among his publications are his four *Institutes*, the first of which (*Coke upon Littleton*) is very famous.

Colbert, Jean Baptiste (1619–83), French statesman, who fostered new industries and encouraged commerce, endeavoured to reform the finances, and established the French Navy on a sound basis. A patron of literature, science, and art.

Cole, George Douglas Howard, M.A., (1889–1959), British economist, sociologist, and writer; Chichele Professor of Social and Political Theory at Oxford, 1944–57; Chairman Fabian Society, 1939–46; Pres. Int. Society for the Study of Socialism from 1956 until his death. Among his numerous writings on social and economic problems are *The Intelligent Man's Guide through World Chaos* (1932), *The Post-War Condition of Britain* (1956), *The Case for Industrial Partnership* (1957), *A History of Socialist Thought* (5 vols.).

Coleridge, 1st Baron (1820–94), Lord Chief Justice of England from 1880 until his death. Was a distinguished scholar, orator and barrister, his most famous case being the Tichborne trial in 1871, when his speech for the defence lasted 23 days.

Coleridge, Samuel Taylor (1772–1834), one of the great poets of the early part of the 19th century, whose *Ancient Mariner* and a few other poems stand unsurpassed for poetic beauty and originality.

Coleridge-Taylor, Samuel, A.R.C.M. (1875–1912), British composer, the son of a West African negro doctor practising in London, and an Englishwoman. He studied at the Royal College of Music where his *Hiawatha's Wedding Feast* was performed in 1898.

Colet, John (*c.* 1467–1519), humanist and divine, founded St. Paul's School, 1512. As scholar and friend of Erasmus he helped to bring the New Learning to England.

Colette (Sidonie Gabrielle Claudine Colette) (1873–1954), author of a number of highly successful novels including the famous *Claudine* stories, *Chéri* and *La Fin de Chéri*. Grand Officier de la Légion d'Honneur (1953).

Collier, Hon. John (1850–1934), English painter who became highly popular for his "problem" pictures. He is best remembered, however, as a distinguished portraitist.

Collingwood, Lord (1750–1810), British admiral whose ship the *Royal Sovereign* led the fleet to battle at Trafalgar and who on Nelson's death assumed the command.

Collins, Michael (1890–1922), brilliant and daring Irishman, leading spirit of the Sinn Fein political movement. Took part in the Easter Rebellion and organised the guerilla warfare which eventually led to the breakdown of British government and to the Anglo-Irish Peace of Dec. 6, 1921. Killed in ambush by Republicans after his return from England.

Collins, William, R.A. (1788–1847), a noted landscape and figure painter, and father of Wilkie Collins.

Collins, William Wilkie (1824–1889), the novelist, was for many years associated with Charles Dickens, and wrote *The Dead Secret*, *The Woman in White*, and *No Name*.

Colt, Samuel (1814–1862), of Hartford, Connecticut, invented the revolver and patented it in 1835. It was some time before its utility was recognised, but after being used with great effect in the war with Mexico it was universally adopted.

Columba, St. (521–597), the founder of the monastery of Iona, was a native of Ireland. From his lonely island shrine he made frequent missionary journeys to the Highlands of Scotland, where he made many converts and was greatly revered.

olumbus, Christopher (*c.* 1446–1506), the famous Italian navigator, who, prevailing upon Ferdinand and Isabella of Spain to bear the expense of an expedition of discovery, set out on his first voyage in 1492. He first discovered the Bahamas, Cuba, and other West Indian islands, and, on his third voyage, in 1498, landed on the lowlands of South America.

olvin, Sir Sidney (1845–1927), friend of R. L. Stevenson and biographer of Keats. Was Keeper of Prints at the British Museum, 1884–1912. Author of numerous works on art and literature.

omenius, Johann Amos (1592–1670), famous Czech educationist. Was the first advocate of the "direct" method of teaching languages, of the use of pictures in education, and of the teaching of science.

ompton, Arthur Holly (1892–1962), American physicist whose work on X-rays led to the discovery of the so-called "Compton Effect," for which he shared with C. T. R. Wilson the 1927 Nobel Prize for Physics. He also made important cosmic-ray investigations and helped to develop the atomic bomb. His brother Karl Taylor Compton (1887–1954) was also a physicist who did important research on radar and the ionisation of gases.

ompton-Burnett, Ivy, British novelist, whose books deal with family relationships and include *Men and Wives*, *A House and its Head*, *Man Servant and Maid Servant*, *The Present and the Past*, *A Heritage and its History*.

omte Auguste (1798–1857), French philosopher; founder of positivism, and father of social philosophy.

ondé, Louis II., de Bourbon, Prince de, "The Great Condé" (1621–1686), was a distinguished military commander. Victor of Rocroi, 1643.

onfucius (*c.* 551–479 B.C.), Chinese philosopher and sage, founder of the great world religion of Confucianism. He was not concerned with the supernatural but appealed to reason and taught love and respect of one's fellows, superiority to ambition, charity, forgiveness, and repentance. (*See* **Confucianism, Section J.**)

ongreve, William (1670–1729), was a famous Restoration dramatist, whose comedies of manners reflect the grossness of his age only too closely, but are redeemed by the brilliancy of his wit. He was buried in Westminster Abbey.

onrad, Joseph (1857–1924), English novelist of Polish birth whose parents were exiled to France for political reasons. He became master mariner in the British merchant service and began to write novels after he left the sea in 1884. He has a beautiful prose style and is acknowledged to be a significant figure in English literature. His novels include: *Almayer's Folly* (1895), *Lord Jim* (1900), *Nostromo* (1904).

onscience, Hendrik (Henri) (1812–83), the famous Flemish novelist whose historical romance, *The Lion of Flanders*, earned him a distinguished place in the world of literature.

onstable, John, R.A. (1776–1837), was a native of East Bergholt, Suffolk, and became one of the greatest of English landscape painters. He had long to wait for recognition, but ultimately attained high honour and exerted a strong influence in the development of landscape art.

onstant, Jean Joseph Benjamin (1845–1902), French portrait and subject painter; *Prisoners in Morocco*, *The Harem*, and *The Emir's Favourite* are among his celebrated Oriental pictures.

nstantine the Great (*c.* 272–337). Emperor of Rome from 306 to his death. Transferred the Capital of the Empire from Rome to Byzantium, thence called Constantinople after his name.

nstantine I. (1868–1923), King of Greece, 1913–17, and 1920; married Princess Sophia of Prussia, sister of the Kaiser.

ok, Captain James (1728–1779), an adventurous navigator, whose *Voyages Round the World* is a classic. He made many discoveries in the name of Great Britain, including the Sandwich (now Hawaiian) Islands. He was murdered at Hawaii by natives.

oper, Sir Astley Paston, Bt., F.R.S. (1768–1841), one of the greatest surgeons of his time, and the author of several important medical textbooks.

oper, James Fenimore (1789–1851), was a very popular American novelist, who from about 1820 to the time of his death produced a succession of stirring stories of adventure, which enjoyed much popularity, among them *The Spy*, *The Last of the Mohicans*, *The Pathfinder*, and *The Deer Slayer*.

Cope, Sir Arthur Stockdale, K.C.V.O., R.A. (1857–1940), was a well-known portrait painter.

Copernicus, Nicholas (1473–1543), founder of modern astronomy, was born at Thorn on the Vistula, then under Polish suzerainty. Studied at Cracow and in Italy, lectured on astronomy and mathematics at Rome and in 1512 settled at Frauenburg, where he was canon of the cathedral. He also practised medicine. His beliefs concerning the universe were set forth in his great book *De revolutionibus orbium coelestium*, which was not published until his death for fear of the storm his revolutionary theories would raise. In it he proved that the planets, including the earth, revolve round the sun.

Coppée, François Joachim (1842–1908), French poet, dramatist and novelist.

Coquelin, Benoit Constant (1841–1909), eminent French actor ("Coquelin aîné"), and **Coquelin, Ernest** ("Coquelin cadet"), his youngest brother (1848–1909), were leading lights of the Théâtre Français.

Corelli, Arcangelo (1653–1713), Italian composer and the first great violinist to enjoy universal fame; founded the present art of violin playing and gave definitive form to the *concerto grosso*.

Corneille, Pierre (1606–1684) the French tragic dramatist, whose *Cid*, *Polyeucte*, *Le Menteur*, and other plays marked a new era in French dramatic production.

Cornwallis, 1st Marquess (1738–1805), commander of the British forces which surrendered to the Americans, at Yorktown in 1781, thus ending the War of Independence; was twice Governor-General of India.

Corot, Jean Baptiste (1796–1875), a French landscape painter of great repute.

Correggio, Antonio Allegri da (1494–1534), the great Italian painter of the Lombard School, whose "Ecce Homo" is in the British National Gallery.

Cortes (or Cortez), Hernando (1488–1547), a Spanish adventurer who earned great renown by capturing Mexico for Spain, and held that country in subjection for ten years.

Cortot, Alfred (1877–1962), French pianist and conductor, best known for his playing of Chopin, Liszt, and Schumann; chorus director at Bayreuth; conducted first complete performance in Paris of Wagner's *Ring*.

Cosgrave, William Thomas (b. 1880), President of Executive Council, Irish Free State, 1922–32; Finance Min., 1923; Defence Min., 1924; Parl. Chairman Fine Gael, 1933–44.

Costello, John A., S.C. (b. 1891), Prime Minister of Irish Republic 1948–51 and 1954–57. When Attorney General, Irish Free State, 1926–32, helped to draft the Statute of Westminster.

Coulton, George Gordon, Litt. D., LL.D. (1858–1947), scholar and historian of the Middle Ages, whose main claim to fame rests upon *Five Centuries of Religion*, works in which he set forth his interpretation of monastic history in England from the Conquest to the Reformation.

Couperin. A notable family of French musicians who were organists at St. Gervais, Paris, from about 1650 until 1826. **François Couperin** (1668–1733), called "Couperin the Great," is the best known today for his harpsichord music.

Cousin, Victor (1792–1867), French educationist and philosopher, founder of the eclectic school. He was a remarkable lecturer and his writings cover nearly the whole field of philosophy.

Cousins, Samuel, R.A. (1801–1887), the greatest mezzotint engraver of his day, whose plates after Reynolds, Millais, Landseer, and Hogarth reach the highest point of this kind of art work.

Cousteau, Jacques-Yves (b. 1910), French underwater explorer, pioneer of aqualung diving, whose research into the feasibility of humans living in undersea "villages" has aroused wide interest.

Couve de Murville, Maurice (b. 1900), French diplomat who has been Foreign Minister since Gen. de Gaulle's return to power in 1958. He lost his seat in the 1967 general election.

Coverdale, Miles (1488–1568), one of the early English Reformers, was born in Yorkshire, and afterwards became a monk of Norwich and later Bishop of Exeter. He collaborated with Tyndale in translating the Bible; the Psalms still used in the Prayer Book are taken from their translation.

Coward, Noel (b. 1899), a successful English playwright and actor. His works include *Hay Fever, Private Lives, Blithe Spirit,* the operetta *Bitter Sweet* and the films *In Which We Serve, This Happy Breed,* and *Brief Encounter.*

Cowper, William (1731–1800), an English poet imbued with much piety of sentiment and a remarkable poetic talent. His *Task* is one of the great poems of the 18th century.

Cox, David (1783–1859), an eminent landscape painter—son of a Birmingham blacksmith—whose pictures are thoroughly English in spirit and treatment.

Crabbe, Rev. George (1754–1832), a poet of rural life and scenes, noted for his faithful pictures, characterisation and soundness of his sentiments.

Craig, Edward Gordon, C.H. (1872–1966), the son of Ellen Terry, author of several books on stagecraft. He produced many plays in England and on the Continent.

Cranmer, Thomas (1489–1556), Archbishop of Canterbury under Henry VIII, and Edward VI.; an ardent promoter of the Reformation. On Mary's accession at first consented to return to the old faith, but when called upon to make public avowal of his recantation, refused, and was burnt at the stake. His great contributions were the English Bible and Book of Common Prayer.

Crichton, James (1560–1582). Scottish adventurer who earned considerable renown for his scholarly accomplishments and charm and was called "The Admirable Crichton." He was assassinated when only twenty-two years of age in Mantua.

Cripps, Rt. Hon. Sir (Richard) Stafford, C.H., Q.C. (1889–1952), British statesman and barrister, younger son of Lord Parmoor and nephew of Beatrice Webb. In charge of post-war Britain's economic affairs. His programme was one of purposeful austerity, but his outstanding ability and masterly exposition of the economic situation won him support from all sides. He showed that liberty and planning can be reconciled in the modern world. Labour M.P. for S.E. Bristol, 1931–50. Gave up a brilliant career at the bar to enter politics. Ambassador to Moscow, 1940–42, and Min. of Aircraft Production, 1942–45. Went on missions to India in 1942 and 1946. Resigned his seat in Parliament and as Chancellor of the Exchequer in 1950 because of broken health; was taken to Switzerland for a cure, but he did not recover.

Crispi, Francesco (1819–1901), noted Italian statesman, who aided Garibaldi and was his supporter throughout. Premier 1887–91 and 1893–96. Achieved many reforms for his country.

Crispin, St., a saint of the Roman Church and patron of shoemakers. In the 3rd century he and his brother, natives of Rome, settled in Soissons, France, and there preached Christianity, supporting themselves by shoemaking. Suffered martyrdom under Diocletian in 289, by being thrown into a cauldron of molten lead; commemorated on Oct. 25.

Croce, Benedetto (1866–1952), Italian philosopher and critic and one of the great figures of the 20th century. Devoted his long life to studying and writing, and his philosophy is expounded in the four volumes of *Filosofia dello Spirito* (which has been translated into English). He founded and edited *La Critica* in 1903, a review of literature, history, and philosophy. Strongly opposed to fascism, he was described during the war as "the grand old man who kept a torch burning in Naples which even Mussolini did not dare to extinguish."

Crœsus (died c. 546 B.C.) the last King of Lydia (560–546 B.C.), who reigned fourteen years, and acquired such immense wealth that his name has ever since been proverbial. He was a wise king, whose memory still survives in his wise sayings. Solon was his friend, and it was Solon's name that he uttered thrice while standing before the pyre on which Cyrus had condemned him to be burnt. This touched Cyrus, who spared his life and made him his companion. He succeeded his father Alyattes on the Lydian throne, 560 B.C.

Crome, John (1769–1821), known as "Old Crome," from being a humble house-painter became eminent as a painter of landscape.

Cromer, 1st Earl of, P.C., G.C.B., O.M., G.C.M.G., K.C.S.I., C.I.E., F.R.S. (1841–1917), a diplomatist who won celebrity in the post of British Comptroller-General in Egypt from 1883 to 1907. It was a stupendous task that he had imposed upon him, but he resolutely devoted himself to it, with the result that Egypt was lifted from financial difficulty and internal disorder to a condition of prosperity. In 1908 published *Modern Egypt* and *Ancient and Modern Imperialism* in 1910.

Crompton, Samuel (1753–1827), was a poor cotton worker at Bolton who invented the spinning mule, which greatly increased the power of cotton production. Received little recognition.

Cromwell, Oliver (1599–1658), Lord Protector of the commonwealth of England, Scotland and Ireland, 1653–58. Born at Huntingdon, educated at Sidney Sussex College, Cambridge, and entered parliament as member for Huntingdon in 1628. With outbreak of civil war served with the parliamentary army under Essex and won renown at Edgehill (1642). Celebrated as a great general, leader of his Ironsides, for his religious toleration, and strong foreign policy. His victories include Marston Moor (1644), Naseby (1645), Dunbar (1650), Worcester (1651).

Cromwell, Richard (1626–1712), son of the foregoing, and his successor in the Protectorate.

Cromwell, Thomas (1485–1540), originally a protégé of Wolsey, rose to high office under Henry VIII, and began the suppression of the monasteries. Executed after the failure of the Anne of Cleves marriage, which was part of his policy of alliance with the Protestant princes of Germany.

Crookes, Sir William, O.M., F.R.S. (1832–1919) eminent British scientist whose researches in chemistry and physics led to many important discoveries and inventions. He discovered the metal thallium in 1861, invented the radiometer and the Crookes' tube, which was used by J. J. Thomson and others in their researches on conduction of electricity in gases. He was also an authority on sanitation. President of the Royal Society, 1913–16.

Cruikshank, George (1792–1878), a celebrated book illustrator who was for a time associated with Charles Dickens, and later on illustrated numerous works of other novelists of his day, showing great humour and power of character-delineation.

Cummings, Bruce Frederick (1889–1917), English zoologist and man of letters. Won fame with his *Journal of a Disappointed Man.*

Cunard, Sir Samuel, Bt. (1787–1865), shipowner and co-founder of the British and N. American Royal Mail Steam Packet Co. which later became the Cunard Line and as a result of a merger in 1934, the Cunard-White Star Line, owners of the two largest liners afloat—the *Queen Elizabeth* and the *Queen Mary.*

Cunningham of Hyndhope, Admiral of the Fleet, Viscount, K.T., G.C.B., O.M., D.S.O. (1883–1963), won the D.S.O. and two bars in the first world war, C.-in-C., Mediterranean, 1939–42 Allied Naval C.-in-C., North African campaign. First Sea Lord, 1943–46.

Cunningham, General Sir Alan Gordon, G.C.M.G., K.C.B., D.S.O., M.C. (b. 1887), brother of Viscount Cunningham. Directed Abyssinian campaign and commanded 8th Army, 1941. From 1945 served as the last British High Commissioner in Palestine.

Cunningham, Admiral of the Fleet, Sir John Henry Dacres, G.C.B., M.V.O. (1885–1962), C.-in-C., Mediterranean, 1943–46. First Sea Lord 1946–48.

Curie, Prof. Pierre (1859–1906) and **Madame Marie** (1867–1934) are names that have become famous as the discoverers of radium. M. Curie was a Frenchman, Mme. Curie a Pole; they were both indefatigable scientific investigators. Shared the Nobel Prize for Physics 1903, while their daughter, the late Mme. Irène Joliot-Curie, shared with her husband the 1935 Nobel Prize for Chemistry, awarded for their researches in radioactivity.

urzon of Kedleston, Marquess, K.G., P.C., G.C.S.I., G.C.I.E. (1859–1925), statesman and administrator. As a young man gained distinction as traveller and author. From 1899 to 1905 was a vigorous and outstanding Viceroy of India. Foreign Secretary, 1919–23, when he played a dominant part in the reconstruction of the Middle East and was prominent at many conferences after the first world war.

uthbert, St. (635–687), a famous monk who became prior of Melrose, and afterwards of Lindisfarne. For a time he lived in seclusion on one of the Farne Islands, but from 684 was Bishop of Hexham.

uvier, Georges Léopold, Baron (1769–1832), a French naturalist who founded a system of classification in zoology, and originated the science of comparative anatomy.

uyp, Albert (1620–1691), a famous Dutch landscape painter, several of whose works are in our National Gallery.

yprian, St., was an eminent ecclesiastic of the 3rd century, who wrote several notable treatises on matters of Christian doctrine. He was beheaded in 258, at an advanced age, and the present English calendar commemorates him on Sept. 26.

yrus the Great (d. 529 B.C.), the founder of the Persian Empire who by his conquests of Media, Lydia, and Babylonia, made himself master of Asia Minor. He was a great warrior and a wise ruler and figures prominently in the Bible. He was slain in battle on the river Jaxartes.

D

aguerre, Louis Jacques Mandé (1789–1851), a French artist, who acquired fame as the inventor of the earliest photographic process, and then devoted himself to scene-painting and became part-proprietor of the Diorama in Paris.

aimler, Gottlieb (1834–1890), German inventor with N. A. Otto of Cologne of the Otto gas engine, and in his later years eminent as the inventor of the motor-car that is named after him.

ale, Sir Henry Hallett, O.M., G.B.E., F.R.S., M.D., D.Sc., LL.D., F.R.C.P. (b. 1875). President, British Association, 1947, and of the Royal Society, 1940–45. Chairman of the Lister Institute of Preventive Medicine, 1942. Awarded Nobel Prize for Medicine, 1936.

alhousie, 1st Marquess of, P.C., K.T. (1812–1860). The tenth Earl and first Marquess of Dalhousie was one of the most famous of India's Governors-General. He controlled the affairs of India during a period of great difficulty, and annexed the Punjab after the second Sikh War; later on also annexing Nagpur Jhansi, Pegu and other States. He left India in 1856, the year before the Mutiny.

ali, Salvador (b. 1904), Spanish painter whose *Persistence of Memory* with its bleak landscape and drooping watches is typical of surrealist art. In 1940 he went to live in America.

alton, John (1766–1844), famous chemist and mathematician, renowned for his work on the construction of matter. In 1810 published his classic *A New System of Chemical Philosophy*, in which the modern chemical atomic theory was first propounded. According to this theory the atoms of the chemical elements are qualitatively different from one another.

amien, Father (Joseph de Veuster) (1840–1889), a Belgian missionary who, going out to Honolulu in 1864, and witnessing the terrible sufferings of the lepers confined on the Island of Molokai, obtained permission to take spiritual charge of the Government settlement, and remained there working nobly for this wretched community, until in 1889 he himself was stricken with leprosy and died.

amocles, a Syracusan of the 5th cent. B.C., member of the court of Dionysius I. The legend related by Cicero concerning him is that he flattered his master by expressing his envy of the tyrant's riches and power, whereupon Dionysius, to demonstrate the precariousness of high estate, invited him to a banquet where he found himself sitting beneath a naked sword suspended by a hair. Hence the phrase "the sword of Damocles"—to hang by a thread.

amrosch, Walter Johannes (1862–1950), American musician, active in the musical development of the United States. Conductor of the New York Symphony Society, 1885–1927, and composer of three operas and of incidental music to Greek plays.

D'Annunzio, Gabriele (1863–1938), Italian poet, soldier and airman. In Sept. 1919 he led an unofficial raid on Fiume and seized the port and town; when the Treaty of Rapallo was signed in 1920, he refused to recognise it, and declared war against Italy but was forced to surrender. His bodyguard wore the blackshirt which was to become the uniform of the Fascists.

Dante Alighieri (1265–1321), the greatest Italian poet and one of the great figures of world literature, was born in Florence in a period of political upheaval caused by the strife between Guelph and Ghibelline, which had divided mediaeval Italy for over a century. Though he saw her but once or twice, he conceived an abiding love for a Florentine lady, Bice Portinari (called by Dante Beatrice), wife of Simone di Bardi, whom he first met in 1274. She died in 1290. Some of his finest work was written after he was driven from his native city in 1301. His works include the *Vita Nuova* (written 1292–93 in memory of Beatrice), his supreme masterpiece the *Divine Comedy*, begun 1308–9 and completed shortly before his death, many beautiful lyrics, and some Latin treatises.

Danton, Georges Jacques (1759–1794), a famous member of the National Convention at the period of the first French Revolution. Was made President of the Committee of Public Safety, but Robespierre attacked and supplanted him. Danton was consigned to the guillotine shortly afterwards.

D'Arblay, Madame (1752–1840), better known as Frances (Fanny) Burney, daughter of the organist Dr. Charles Burney, made a great sensation while quite young and unmarried by her novel *Evelina*, which opened the doors of Society to her and gained her the friendship of Dr. Johnson.

Darius was the name borne by three Persian kings. The first reigned from 521 to 485 B.C., and was defeated by the Greeks at Marathon. The second was a natural son of Artaxerxes Longimanus, and having obtained the crown by the murder of his brother, reigned from 424 to 405 B.C. The third Darius was the last of the Persian kings, reigning only from 336 to 331 B.C. when Alexander the Great invaded his kingdom and defeated him in two great battles. Soon after he was assassinated.

Darling, Grace Horsley (1815–1842), English heroine who by putting off in a small boat from the lighthouse on one of the Farne Islands, of which her father was keeper, saved the shipwrecked crew of the *Forfarshire*.

Darnley, Earl of (1545–1567), was married to Mary Queen of Scots—as her second husband—in 1565. Two years later, after Mary had entered into an intrigue with Bothwell, he was murdered.

Darwin, Charles Robert, F.R.S. (1809–1882), the distinguished scientist, whose *Origin of Species* first clearly formulated and elaborated the theory of evolution. His first work (1837) described a five years' cruise in the *Beagle*, which the Government had sent out for scientific purposes. His *Origin of Species* appeared in 1859, and, though defended and supported by the scientific thought of the time generally, was much attacked by theologians. In 1871 Darwin issued his *Descent of Man*, a still further elaboration of the evolution theory. His other principal works were *The Expression Of Emotion in Man and Animals* (1872), *Insectivorous Plants* (1875), *Different Forms of Flowers* (1877), and *Worms* (1881).

Daudet, Alphonse (1840–1897), the celebrated French humorist and novelist, all of whose works have been translated into English.

Davenant, Sir William (1606–1668), a dramatist and poet of much note in his time, who filled the office of Poet Laureate in succession to Ben Jonson.

David I. (1084–1153) was King of Scotland and uncle of Matilda, daughter of Henry I.; he took up arms against Stephen on his repudiation of Matilda's claims to the English crown.

David II. (1324–1371), King of Scotland from 1330 to 1370. He was the son of Robert Bruce, and in conflict with the English Army at Neville's Cross, in 1346, was defeated and made prisoner by Queen Philippa.

David, Sir (Tannatt William) Edgeworth, K.B.E., C.M.G., D.S.O., F.R.S. (1858–1934), an Australian geologist of the first rank, who was Professor of Geology at Sydney University 1891–1924. Spent much of his time in exploration, and accompanied as geologist Shackleton's Antarctic Expedition, 1907–9, leading the party that ascended Mt. Erebus, and discovering with Sir Douglas Mawson the South Magnetic Pole.

David, Jacques-Louis (1748–1825), a celebrated French painter of classic subjects, who put his art at the service of the New Republic.

David, St., patron saint of Wales, whose festival falls on March 1st, lived in the 6th century in Wales, and founded various monasteries.

Davidson, Randall Thomas Davidson, 1st and only Baron, P.C., G.C.V.O. (1848–1930), Archbishop of Canterbury, 1903–1928. Dean of Windsor, 1883–1891; Bishop of Rochester, 1891–1895; and Bishop of Winchester, 1895–1903. Was for a long period Domestic Chaplain and Clerk of the Closet to Queen Victoria, and married in 1878 the daughter of Archbishop Tait.

Davies, Rt. Hon. Clement, Q.C., M.P. (1884–1962), lawyer and politician. Called to the Bar, 1909, took silk, 1926. He led the Liberal Party from 1945 until 1956, and represented his native Montgomery from 1929 until his death.

Davies, Sir (Henry) Walford, K.C.V.O., O.B.E., Mus.D., D.Mus. (1869–1941), Master of the King's Music, 1934–41; Director of Music and Chairman of the National Council of Music, University of Wales, 1919–41, the Gresham Prof. of Music, 1924–41.

Davies, William Henry (1871–1940), was a Welsh poet who spent his early life as a tramp and odd-job man. For six years he wandered about America, where he lost a foot "train-jumping," and for eight years followed a similar life in England, tramping, peddling and stopping in common lodging-houses. His poems reveal an intimate knowledge of and love for Nature. An account of his life is given in his *Autobiography of a Super Tramp.*

Da Vinci. *See* Leonardo.

Davis, Jefferson (1808–1889), an American statesman, who on the breaking out of Civil War, was made President of the Confederate States. After the war he was a prisoner in the hands of the Federals, put on his trial for treason, and subjected to much indignity, but was ultimately discharged and wrote (1881) *The Rise and Fall of the Confederate Government.*

Davis, John (*c.* 1550–1605), one of the great Elizabethan explorers and discoverer of Davis's Strait, the channel between the Atlantic and Arctic Oceans on the west of Greenland. Invented the backstaff, or Davis's quadrant.

Davitt, Michael (1846–1906), after a hard-working and precarious bringing up this ardent Irish Nationalist attracted much notice by the bitter speeches he made on behalf of the Fenian Brotherhood, and in 1870 was sentenced to fifteen years' penal servitude for treason-felony, but was released on ticket of leave in 1877. Was one of the founders of the Irish Land League 1879. In 1881 was sent back to penal servitude, but released again in the following year. Was elected to Parliament while a prisoner at Portland but disqualified. Succeeded in entering Parliament in 1892, and resigned in 1899.

Davy, Sir Humphry, Bt., F.R.S. (1778–1829), the inventor of the safety-lamp. Was an eminent chemist whose researches and discoveries were of great scientific importance. Was the first to employ the electric current in chemical decomposition and discovered that nitrous oxide was perfectly respirable.

Dawber, Sir (Edward) Guy, R.A. (1861–1938), English architect. As Chairman of the Council for the Preservation of Rural England, he did much to bring about the restoration of buildings throughout the country.

Dawkins, Sir William Boyd (1837–1929), British geologist, noted for his research on fossil mammals. Made Channel Tunnel survey in 1882.

Dawson, (George) Geoffrey (1874–1944), editor of *The Times*, 1912–19, and 1923–41; educated at Eton and Oxford; was private secretary to Lord Milner in S. Africa, 1901–5, editor of the *Johannesburg Star*, 1905–10.

Deakin, Rt. Hon. Arthur, C.H., C.B.E., J.P. (1890–1955), Trade Union leader; succeeded Ernest Bevin as general secretary of the Transport and General Workers' Union in 1949 and like him was a master negotiator.

Debussy, Claude Achille (1862–1918), French composer and founder of the Impressionist school in music, whose harmonies have a vague "atmospheric" effect. Among his works are *Suite bergamasque*, containing the popular *Clair de lune*, *L'après-midi d'un Faune*, inspired by the poem of Mallarmé, and *La Mer*. He also wrote an opera *Pelléas et Mélisande* based on Maeterlinck's drama and many piano compositions and songs. *See* Section E.

Defoe, Daniel (1660–1731), the son of a London butcher. He became a political writer and novelist, obtaining world-wide fame by his *Robinson Crusoe*, written when he was nearly sixty years of age.

De Forest, Lee (1873–1961), American inventor who was the first to use alternating-current transmission, improved the thermionic valve detector and amplifier, which revolutionised wireless and by which modern wireless and sound films (Talkies) were made possible. He designed the first high-power station for the United States Navy and was granted over three hundred patents.

Degas, (Hilaire Germain) Edgar (1834–1917), French painter and sculptor, son of a banker, an important figure in the impressionist movement and a great experimenter. The subjects which interested him were those of everyday life—dancers, café life, the racecourse.

De Gasperi, Alcide (1881–1954), Italian catholic politician. Founded the Christian Democrat Party and worked for European federation. Died on eve of breakdown of Brussels Conference on E.D.C. Prime Min. 1945–53.

De Gaulle, General. (*See* Gaulle, Charles de.)

De Havilland, Sir Geoffrey, O.M., C.B.E., F.R.Ae.A. (1882–1965), a pioneer of civil and military aviation. Began flying in 1908 and was the founder of the Stag Lane Aerodrome at Hendon and the designer of the famous Moth machines. Contributed in great measure to the advance of civil aviation since the first world war. Awarded the Guggenheim Medal in 1952. His son was killed in 1946 while testing a plane in preparation for breaking world speed record.

Delacroix, Ferdinand Victor Eugène (1798–1863), French painter of great imaginative and dramatic force, of the romantic school.

De la Mare, Walter John, O.M., C.H. (1873–1956), English poet and novelist whose work has a characteristic charm. Much of it was written for children.

Delane, John Thadeus (1817–1879), the famous editor of *The Times*, who, though he did not write himself, made his paper the greatest journal in the world. He occupied the editorial chair from 1841 to 1877.

Delaroche, Paul (Hippolyte) (1797–1856), an eminent French historical painter.

Delibes, Clément Philibert Léo (1836–91), French composer of much graceful music, including several operas, of which *Lakmé* is the most famous, and ballets, among them *Coppélia.*

Delius, Frederick, C.H. (1862–1934), English composer of German parentage. Studied at Leipzig from 1886 to 1888 where his suite *Florida* was first performed. In 1899 he went to live near Paris but became crippled and blind in his later years. Highly idiosyncratic in idiom, his music was more readily received in Germany than England until Sir Thomas Beecham's inspired performances won popularity for him in his native land. *See* Section E.

Democritus (*c.* 460–357 B.C.), the Greek philosopher to whom the conception of the atomic theory is attributed. His cheerful disposition led to his being styled "the laughing philosopher," and the tradition tells that he put out his eyes in order not to be distracted in his speculations.

Demosthenes (385–322 B.C.), the famous Greek orator, statesman and warrior who, by his *Philippics*, roused the Athenians to resist the growing power of Philip of Macedon. Sixty-one of his orations were preserved, and are regarded as the finest examples of their kind.

e Quincey, Thomas (1785–1859), an eminent essayist and critic, the friend of Coleridge, Wordsworth, and Southey. His *Confessions of an Opium-eater* is a British classic.

e Reszke, Jean (1853–1925) and **De Reszke, Edouard** (1856–1917), Polish operatic singers, the first a tenor, the second a baritone, who achieved fame and fortune by their singing.

erwentwater, 3rd Earl of (1689–1716), the leader of the English Jacobite movement for placing the Pretender on the English throne. The rising took place in 1715, but was completely crushed by the Battle of Preston, and Derwentwater was beheaded.

escartes, René (1596–1650), the famous French philosopher, mathematician, and author. Unconvinced by scholastic tradition and theological dogma, he sought to get back to primary truth, to the very definition of knowledge or the reason why anything can be said to be true. The basis of his Cartesian philosophy is summed up in his own words *cogito, ergo sum* (I am thinking so I exist).

esmoulins, Lucie Simplice Camille Benoist (1760–1794), was one of the fiercest of the French Revolutionary leaders, and from the destruction of the Bastille to the early days of the Terror was unflagging in his onslaughts upon the aristocrats and the priesthood. He fell under the displeasure of Robespierre, however, and was sent to the guillotine along with Danton.

e Valera, Eamon, LL.D. (b. New York, 1882), Pres. Rep. of Ireland, 1959– ; leader of the Fianna Fail Party; Prime Minister 1938–48, 1951–54, and 1957–59; Minister for External Affairs 1932–48. Pres. of Executive Council of Irish Free State, 1932–38; Pres. of Sinn Fein 1917–26 when Fianna Fail was founded; Delegate to Assembly and Council of League of Nations, 1932, and President thereof 1932 and 1938.

e Valois, Dame, Ninette, D.B.E. (b. 1898), Irish-born ballet dancer and choreographer. Between world wars had many triumphs as a dancer with the British National Opera company and with the Diaghilev Russian ballet. Director of the Royal Ballet School (formerly the Sadler's Wells School).

ewar, Sir James, F.R.S. (1842–1923), physicist and chemist, a native of Kincardine. From 1875 until his death Jacksonian Prof. of Natural Philosophy at Cambridge and from 1877 Fullerian Prof. of Chemistry at the Royal Institution. Famous for his work on the liquefaction of gases and his invention of the Thermos flask. Invented, with Sir F. Abel, the explosive cordite.

ewey, Prof. John (1859–1952), the eminent American philosopher, psychologist and educationist, who, after holding professorships at the Universities of Minnesota, Michigan, and Chicago, where he was also Director of the School of Education until 1904, was Prof. of Philosophy at Columbia University, New York, 1904–32. A follower of William James, he became well known in America as an adherent of pragmatism.

e Witt, Jan (1625–72), Dutch republican statesman, who carried on war with England and later negotiated the Triple Alliance, but was overthrown by the Orange Party and murdered.

iaghilev, Sergei Pavlovich (1872–1929), Russian ballet impresario and founder of the Russian ballet, who selected the best dancers, musicians, and artists in his productions. Among those associated with him were Anna Pavlova, Vaslav Nijinsky, Tamara Karsavina, Leonide Massine, Michel Fokine, the choreographer, L. N. Bakst, the painter, and Igor Stravinsky, the composer.

ck, Sir William Reid, K.C.V.O., R.A., F.R.B.S. (1879–1961), British sculptor whose works include the Livingstone statue (Victoria Falls, Africa), memorial statue of King George V. at Westminster, and the statue of Pres. Roosevelt in Grosvenor Square.

ckens, Charles (John Huffam) (1812–1870), the most popular novelist of the 19th century, who from very humble beginnings worked himself up to the highest position in the world of letters. His literary output was enormous. From the time of the publication of the *Pickwick Papers* down to his death in 1870, covering a period of 33 years, he produced novel after novel, all possessing the original Dickensian characteristics, yet each wonderfully different from the rest and his popularity continues undiminished. He did so much for the cultivation of the true sentiment of Christmas that, whenever that season comes round, his name is recalled with honour and homage. As a public reader of his own works Dickens evinced a marvellous dramatic gift. He was buried in Westminster Abbey.

Dickinson, Goldsworthy Lowes (1863–1932), English scholar, author and philosopher; an interpreter and upholder of the Greek view of life, which is the subject of many of his books.

Dicksee, Sir Francis Bernard, R.A. (1853–1928), well known as the painter of numerous pictures, including "Harmony," "Romeo and Juliet." and "The Funeral of a Viking."

Diderot, Denis (1713–1784), the famous French philosopher and editor of the *Dictionnaire Encyclopédique*, which occupied him thirty years.

Diefenbaker, Rt. Hon. John George, M.A., Q.C. (b. 1895), Canadian lawyer and leader of the Canadian Progressive Conservative Party; Prime Min., 1957–63.

Diemen, Anthony van (1593–1645), Dutch Admiral who was Governor-General of the East Indian Colonies, 1636–45. He extended Dutch influence and trade throughout the Far East, promoted explorations to Australia, 1636–42, and on one of such explorations, Abel Tasman discovered New Zealand and named the island which we now know as Tasmania, Van Diemen's Land.

Diesel, Rudof (1858–1913), German engineer, inventor of an internal-combustion engine which he patented in 1893. The modern so-called Diesel engine represents the improvements achieved by many men and has evolved mainly from the invention of Herbert Akroyd-Stuart, patented in 1890.

Diocletian (Caius Aurelius Valerius Diocletianus) (245–313), Roman Emperor (284–305). Inaugurated the system of partnership emperors, whereby the Empire was divided into four sections (the famous tetrachy), administered by himself in the East, Maximian in Italy and Africa, Constantius in Britain, Gaul, etc., and Gallerius in Illyricum. Ruthlessly persecuted the Christians.

Diogenes (412–322 B.C.), the celebrated Greek cynic philosopher who is said to have lived in a tub wearing the coarsest clothing and living on the plainest food. Many of his sayings have been preserved.

Dionysius. Two of the tyrants of Syracuse bore this name. The first was a great soldier and statesman as well as a poet and philosopher, and lived from *c.* 430–367 B.C. The second Dionysius was his son and successor, but was of such a cruel disposition that he was driven from the throne and died in obscurity in 343.

Disney, Walter Elias ("Walt") (b. 1901), American film cartoonist; creator of Mickey Mouse. His *Silly Symphonies, Snow White and the Seven Dwarfs*, *Pinocchio*, and *Fantasia* brought him world-wide fame.

Disraeli, Benjamin. (*See* Beaconsfield).

D'Israeli, Isaac (1766–1848), father of Benjamin Disraeli, worked in a special literary field, and produced some interesting volumes dealing with authors and their writings. His best-known work is *Curiosities of Literature*.

Dixon, Harold Bailey (1852–1930), Professor of Chemistry at Manchester University, 1887–1922, whose work on gaseous explosions opened a new era in combustion research.

Dobson, Frank, C.B.E., A.R.A., A.R.B.S. (1888–1963), English sculptor. President of the London Group, 1923–27.

Dobson, Henry Austin, LL.D. (1840–1921), a Civil Servant from 1860 to 1901, he was the author of several volumes of Society verse and prose works, dealing chiefly with the 18th century.

Dodd, Francis, R.A., R.W.S. (1874–1949), painter, engraver and draughtsman. He was one of the official artists during the War of 1914–18, and executed a valuable series of portraits of British Admirals and Generals on active service. Appointed one of the official artists for the second world war, 1939–45.

Dodgson, Charles Lutwidge (1832–1898), a writer and mathematical lecturer at Christ Church, Oxford, who, under the pseudonym of Lewis Carroll, achieved lasting fame by his *Alice's*

Adventures in Wonderland, one of the most delightful books for children ever written.

Dolci, Carlo (1616–1686), the famous Florentine painter, examples of whose Madonnas and Saints are to be found in most National collections.

Dolci, Danilo (b. 1925), Italian architect who since 1952 has dedicated himself to the rehabilitation of the people of Sicily in their desperate poverty. He began with no resources but his own humanity, but now his work—agricultural, educational, and social—is inspiring world-wide interest.

Dominic, St. (1170–1221), founder of the Order of Dominicans, or Black Friars, who devoted much energy to the conversion of the Albigenses, but meeting with small success, instituted a policy of persecution after the manner of the later Inquisition.

Domitian (Titus Flavius Domitianus) (A.D. 51–96), Roman Emperor, son of Vespasian, who after many cruel and tyrannical acts aroused the enmity of the people and was assassinated.

Donatello (Donato di Niccolò di Betto Bardi) (1386–1466) the famous Italian sculptor, whose works are to be seen chiefly at Florence, though several examples are at South Kensington.

Donizetti, Gaetano (1797–1848), Italian operatic composer. Most popular of his sixty operas are *Lucrezia Borgia*, *Lucia di Lammermoor*, *La Fille du régiment*, *La Favorita*,and *Don Pasquale*.

Donne, John (1573–1631), an English poet and divine. As a preacher he was celebrated in his lifetime but few of his poems were printed and it was not until the 20th century that he was universally recognised as one of the most original of English poets. His writings include *Songs and Sonnets*, *Satyres*, *Elegies*, *Problems and Paradoxes*, and the *Holy Sonnets*. He took orders in 1615 and was made dean of St. Paul's in 1621. Sir Edmund Gosse's *Life and Letters* appeared in 1899 and Sir Herbert Grierson's monumental edition of Donne's poetry in 1912.

Donoghue, Stephen (" Steve ") (1884–1945), in his day a famous jockey. Rode the Derby Race winner six times, and established a new record by winning this classic event in three successive years, 1921–22–23.

Doré, Gustave (1833–1883), the well-known French artist, famous for his colossal scriptural paintings and his powerful illustrations to the works of Dante, Milton, and Tennyson.

Dostoyevsky, Feodor Mikhailovitch (1821–1881), one of Russia's greatest novelists. Author of *Crime and Punishment Brothers Karamazov*, *The Idiot*, *The Possessed*, etc. Dostoyevsky's novels are quite exceptional for their deep psychological insight, vision and marvellous tragic and analytic power, and have had a profound influence on modern European writers.

Douglas, Marshal of the R.A.F. Lord, G.C.B., M.C., D.F.C. (b. 1893), commanded Fighter Command, 1940–42, R.A.F. Middle East, 1943–44, and Coastal Command, 1944–45. C.-in-C. and Military Governor of British Zone of Germany, 1946–47. A Labour peer.

Douglas, Norman (1868–1952), novelist and writer of witty and elegant prose. A Scot, born in Austria, he made his home on the Mediterranean and was buried on Capri. Travel books include *Siren Land* (1910), *Fountains in the Sand* (1912), *Old Calabria* (1915), *Alone* (1921), *Together* (1923); his highly entertaining novel *South Wind* was published in 1917.

Douglas-Home, Rt. Hon. Sir Alexander Frederick, M.P. (b. 1903), British statesman; Prime Minister, 1963–64; Leader of the Conservative Party, 1963–5; M.P. for Kinross and W. Perthshire, 1963–; Foreign Sec., 1960–63; Sec. of State for Commonwealth Relations, 1955–60. Formerly the 14th Earl of Home; renounced title in 1963 to stand as candidate for House of Commons.

Doulton, Sir Henry (1820–1897), famous potter and the inventor of Doulton ware.

Dowden, Edward, M.A., LL.D., D.C.L., Litt.D. (1843–1913). Well known for his critical and other writings, mainly dealing with the lives and works of the poets. Was Professor of Literature at Trinity College, Dublin, for 37 years

Dowding, Air Chief Marshal Lord, G.C.B., G.C.V.O., C.M.G. (b. 1882), Chief of Fighter Command in Battle of Britain, 1940.

Dowland, John (c. 1563–1626), English composer whose songs with lute accompaniment established him as the foremost lutanist of his day. His son Robert succeeded him as Court lutanist to Charles I.

Doyle, Sir Arthur Conan, M.D. (1859–1930), masterly writer of detective stories, the creator of Sherlock Holmes, the archetype of detectives, who shared a flat in Baker Street with his friend and chronicler, Dr Watson, and conducted a long series of investigations. The immensely popular stories appeared in the *Strand Magazine* and include the *Hound of the Baskervilles* and the *Speckled Band*.

Doyle, Richard (1824–1883), an artist of much humour and fancy, who was exceedingly popular while on the staff of *Punch* from 1841 to 1850. The familiar cover of *Punch* is his work.

D'Oyly Carte, Richard (1844–1901), English theatrical manager, associated with the production of the Gilbert and Sullivan comic operas. The D'Oyly Carte Opera Companies played Gilbert and Sullivan all over the world.

Drake, Sir Francis (c. 1540–1596), the great admiral of Queen Elizabeth's time, who made many adventurous voyages, bent partly on discovery and partly on plunder. He was a leading figure—under Lord Howard—in the attack on and destruction of the Spanish Armada in 1588.

Draper, John William (1811–82), American chemist, b. near Liverpool, aided in the organisation of the medical school of New York university and became its professor of chemistry and physiology. He was the first to take a satisfactory photograph of the human face (1840).

Dreiser, Theodore (1871–1945), an American author whose novels of American life are written in vigorous native prose.

Dreyfus, Lt.-Col. Alfred (1859–1935), a French officer, condemned by a military secret tribunal on a charge of divulging secrets in 1894 to a foreign power, and condemned to imprisonment for life on Devil's Island in French Guiana. At a sensational new trial in 1899 he was again found guilty, and sentenced to a mitigated term of incarceration for ten years; but strenuous efforts on his behalf secured a pardon later. In 1906 he was entirely exonerated and reinstated in the army, with the rank of Major, and made a Chevalier of the Legion of Honour.

Drinkwater, John (1882–1937), was a well-known dramatist and poet. His plays *Abraham Lincoln* and *Oliver Cromwell* have had great praise and success.

Driver, Samuel Rolles (1846–1914) a distinguished Hebrew and Old Testament scholar who was Regius Prof. of Hebrew at Oxford, 1883–1914.

Drummond, William (1585–1649), a Scottish poet —laird of Hawthornden—whose works dealt largely with political matters, but revealed considerable poetic power. Ben Jonson walked from London to Scotland to pay him his respects.

Drury, (Edward) Alfred (Briscoe), R.A. (1857–1944). English sculptor who was responsible for may public monuments, including the colossal statues of Queen Victoria at Bradford and Portsmouth (1903), the decorations for the exterior of the War Office (1905) and of the Victoria and Albert Museum (1909).

Dryden, John (1631–1700), one of the most vigorous and prolific of English poets and writers, and a popular dramatist. He excelled in satire, and drew some powerful pictures of the statesmen of his day. His translation of Virgil ranks with Pope's translation of the *Iliad*. He was buried in Westminster Abbey. Originally a Parliamentarian he went over to the Royalists and was laureate and historiographer-royal, 1670–88.

Du Barry, Marie Jeanne Bécu, Comtesse (1746–1793), succeeded Mme de Pompadour as mistress of Louis XV of France. Guillotined by the Revolutionary Tribunal.

Du Chaillu, Paul Belloni (1835–1903), a noted African traveller who was chief of General Gordon's staff in 1874, and wrote many valuable books of travels, his studies of the gorilla being especially interesting.

Dufferin and Ava, 1st Marquess of, P.C., K.P., G.C.B., G.C.S.I., G.C.M.G., G.C.I.E., F.R.S. (1826–1902), was a diplomatist of great experience, a writer of brilliance, and filled many high offices with distinction and success, including those of Governor-General of Canada and Viceroy of India.

ke-Elder, Sir William Stewart, K.C.V.O., M.A., D.Sc., M.D. (b. 1898), Scottish ophthalmic surgeon at several London Hospitals and Surgeon-Oculist to H.M. Queen Elizabeth.

lles, John Foster, (1888–1959), U.S. Secretary of State in the Republican Administration, 1953–59. In his foreign policy he encountered widespread criticism for his inflexible opposition to negotiation with Russia and U.S. recognition of China.

mas, Alexandre (1802–1870), French novelist and dramatist, who published more volumes than any man of his time. In the field of historical romance he showed wonderful power and resource and his thrilling story *Monte Cristo* is one of the great novels of the nineteenth century. He also wrote *The Three Musketeers*.

mas, Alexandre, Fils (1824–1895), French dramatist and novelist, son of the last-named, author of *La Dame aux Camélias*.

Maurier, George Louis Palmella Busson (1834–1896), one of the best known of the *Punch* artists during a long period and author of the novels of *Peter Ibbetson*, *Trilby*, and *The Martian*.

ndee, John Graham of Claverhouse, 1st Viscount (1648–89), known as "Bonnie Dundee," royalist leader employed in the suppression of the Covenanters, taking part in the defeat at Drumclog and the victory of Bothwell Brig under the Duke of Monmouth in 1679. Defeated Mackay in the pass of Killiecrankie but was killed in the moment of victory.

ns Scotus, Johannes (*c.* 1265–*c.* 1308), famous scholastic, born at Maxton, in the county of Roxburgh; joined the Franciscan Order at Dumfries in 1281; ordained priest at Lincoln in 1291; student and teacher at Oxford and Paris; died at Cologne. He was the great doctrinal opponent of Thomas Aquinas and has been named the Subtle Doctor.

nstan, Saint (909–988), the famous Abbot of Glastonbury and Archbishop of Canterbury, who lived through seven reigns from Ethelstan to Ethelred and exercised great political influence.

pleix, Joseph François (1697–1763), was governor of the French East Indian possessions at the time when Clive was guiding the fortunes of the East India Company, and after Clive's victory at Plassey Dupleix's day was over. He returned to France. and fell into disgrace and poverty.

rer, Albrecht (1471–1528), the great German painter and engraver of Nuremberg, friend of Luther and Melancthon. Like his great Italian contemporary, Leonardo, he was not only a superb artist but a man of boundless intellectual curiosity and scientific insight, a true son of the Renaissance. His copper engravings include his three great masterpieces, *The Knight*, *Melancholia*, and *St. Jerome in His Study*. Many of his engravings are in the British Museum. He may be regarded as the founder of the German school and the inventor of etching.

rham, John George Lambton, Earl of (1792–1840), served as Governor-General of Canada after the disturbances of 1837, and in 1839 presented the famous *Durham Report* to Parliament. This laid down the principle of colonial self-government and marks a turning-point in the affairs of the Empire.

e, Elenora (1861–1924), an Italian tragedienne of world-wide reputation.

val, Claude (1643–1670), a notorious highwayman who, coming to England from Normandy in the Duchess of Richmond's service, took to "the road," and for a few years successfully evaded capture. He was hanged at Tyburn.

veen, 1st and only Baron, of Millbank (1869–1939), was head of a firm of noted art dealers, and a generous benefactor to British Art.

rák, Antonin (1844–1904), Czech composer whose music is rich in the folk-song melodies of his native Bohemia and has a characteristic lilt and harmony. In 1884 he conducted his *Stabat Mater* in London, where this cantata and his *Slavonic Dances* were very popular. Composed his *From the New World* symphony in New York where he was head of the National Conservatoire (1892–94). He wrote 9 symphonies besides much orchestral and chamber work. *See* Section E.

on, Sir Frank (Watson), K.B.E., F.R.S. (1868–1939), Astronomer Royal (1910–33). Was previously (1905–10) Astronomer Royal for Scotland. Was the author of a number of works on astronomy, and widely celebrated for his interesting public lectures.

Dyson, Sir George, K.C.V.O., M.A., Mus.D., LL.D., F.R.C.M. (1883–1964), Director of the Royal College of Music 1938–53. Author of *The New Music*, in which he analyses the technique of modern schools of composition. Composed a symphony, a violin concerto, and several choral works such as *The Canterbury Pilgrims* and *Nebuchadnezzar*.

E

Eastlake, Sir Charles Lock (1793–1865), English painter of historical and religious works. Pres. of R.A. 1850.

Eastman, George (1854–1932), American inventor who invented the roll photographic film and the famous Kodak camera. He amassed a vast fortune and his philanthropies were estimated at over £60 million. After a long illness he committed suicide.

Eck, Johann von (1486–1543), one of the most vigorous opponents of the Reformation in Germany.

Eddington, Sir Arthur Stanley, O.M., F.R.S. (1882–1944), Plumian Professor of Astronomy, Cambridge, 1913; Director of the Cambridge Observatory, 1914–44. Author of *The Nature of the Physical World* (1928) and many scientific works.

Eddy, Mrs. Mary Baker (1821–1910), founder of the religion (theology and practice) which she named Christian Science, and of the Church of Christ, Scientist. Author of the Christian Science textbook, *Science and Health with Key to the Scriptures*, published in 1875. *See also* **J9**.

Edelinck, Gerard (1640–1707), French engraver, b. in Antwerp, the first to reproduce in print the colour, as well as the form, of a picture. Patronized by Louis XIV.

Eden, (Robert) Anthony, 1st Earl of Avon, K.G., M.C., (b. 1897), succeeded Sir Winston Churchill as Prime Minister in April 1955. He had been Deputy Prime Minister and Foreign Secretary since 1951. First appointed Foreign Secretary in 1935 (the youngest to hold that office for over a century), but resigned in 1938 on a difference of policy with Mr. Neville Chamberlain about relations with Italy. Entered Parliament as a member for Leamington in 1923. He has many diplomatic achievements to his credit, though his Suez policy in 1956 divided the country. Resigned because of ill-health in Jan. 1957. Memoirs, *Facing the Dictators; The Reckoning;* and *Full Circle*. Earldom conferred 1961.

Edgar (943–75), King of England 959–75, who under the influence of Dunstan was able to carry out many useful reforms.

Edgar Atheling (*c.* 1060–*c.* 1130), as grandson of Edmund Ironside, was the lawful heir of Edward the Confessor, but in the confusion of the Norman invasion he was unable to maintain his claim.

Edgeworth, Maria (1767–1849), Irish novelist, whose stories included *Castle Rackrent*, *The Absentee*, and *Belinda*.

Edinburgh, H.R.H. Prince Philip, Duke of, K.G., P.C., K.T., G.B.E. (b. 1921), consort of H.M. Queen Elizabeth II. Relinquished his title of Prince Philip of Greece and of Denmark on his naturalisation in 1947, taking the name of Mountbatten. He is the great-great-grandson of Queen Victoria, grandson of Admiral Prince Louis of Battenberg, and nephew of Earl Mountbatten of Burma. Educated in England and Germany and at the Royal Naval College. Served in the Royal Navy throughout the war. Pres. of the National Playing Fields Association; Pres. of the British Association, 1951–52. Chancellor of Edinburgh University, 1953.

Edison, Thomas Alva (1847–1931), an American inventor, who after an adventurous boyhood became a telegraph operator and interested in electrical problems. Established himself in New York in 1869, and invented an improved printing telegraph. In 1867 set up an elaborate laboratory and factory at Menlo Park, New Jersey, from which place he sent out many clever and some startling inventions, including a system of duplex telegraphy, afterwards improved into quadruplex and sextuplex transmission, the phonograph, and a method of preparing carbon filaments for the electric lamp; patented over 1300 inventions.

Edmund II. (Ironside) (980–1016), the son of Ethelred, after years of contention with the Danes, made a compact with Canute to divide England between them, but dying shortly afterwards the kingdom was settled on Canute.

Edward the Confessor (c. 1004–1066), the Anglo-Saxon king who immediately preceded—save for the brief reign of Harold of less than a year—the Norman Conquest, and founded Westminster Abbey, where a smaller church, then dilapidated, had previously for a period had a precarious existence. He was a religious-minded mystic, and was canonised in 1161, and given the shrine in the Abbey of his origination, which yet remains fairly intact, despite the ravages of time and disturbing hands.

Edward the Elder was the son of Alfred, and succeeded him as King of the West Saxons in 899. He was successful in overcoming the Danes, and became overlord of the Northern counties.

Edward the Martyr (963–979) became king in succession to Edgar, but, although supported by Dunstan, was not able to prevail against his stepmother Elfrida, who had him murdered.

Edward I. (1239–1307) was king of England from 1272 to 1307. Took part in the Crusades, completed the conquest of Wales, overcame Scottish opposition—executing Wallace and receiving the submission of Bruce, and promulgated many wise laws. He was nicknamed " Longshanks."

Edward II. (1284–1327), the son of Edward I. succeeded his father when the latter died at Burgh-over-Sands in 1307. Suffered defeat at the hands of the Scots at Bannockburn, and on account of his arbitrary disposition, cruelty and lavish concessions to favourites, was deposed in 1327, and afterwards murdered at Berkeley Castle.

Edward III. (1312–1377) was one of the ablest of English monarchs who, although much taken up with long and bitter wars with France and Scotland, did much for the commercial interests of the nation, and was the means of introducing large numbers of Flemings into the country, who laid the foundation of the English textile manufacturers. He married Philippa of Hainault, and was the father of Edward the Black Prince.

Edward IV. (1442–1483) Yorkist leader whose reign brought about a revival in the power of the monarchy, in English sea power, and in foreign trade. Spent 1470–71 in exile. He died of dissolute living after having made a fortune in trade. Patron of Caxton. Began rebuilding of St. George's Chapel, Windsor.

Edward V. (1470–1483)—elder son of Edward IV. and Elizabeth Woodville. Succeeding his father at the age of 12, he was a pawn in the quarrels of his maternal relatives and his paternal uncle, Richard, Duke of Gloucester. He and his younger brother, Richard, Duke of York, were shut up in the Tower by Richard, declared bastards, and there probably murdered, though conclusive proof of their exact fate has never been established. Thus Richard, who had had himself made Protector, became the legitimate heir to the Crown.

Edward VI. (1537–1553), succeeded his father, Henry VIII., when in his tenth year and died in his sixteenth year. The Reformation under the Regency of Somerset first, and then of Northumberland, made considerable progress during his brief reign. He was induced during his last illness to name Lady Jane Grey his successor, with results disastrous to that unfortunate personage and many others concerned.

Edward VII. (1841–1910). Was married to Princess Alexandra of Denmark in 1863. Visited India in 1875, and from that time onward was constantly in the public eye, taking part in all kinds of functions. Succeeded to the throne on the death of Queen Victoria, Jan. 22, 1901. The Coronation, which had been planned for June 26, 1902, had to be postponed in consequence of the King's sudden illness, but eventually took place on August 9 in the same year. His Majesty was a powerful factor in the preservation of the peace of Europe, his friendly intercourse with the heads of the French, German, and other nations earning for him the titl
of " Edward the Peacemaker."

Edward VIII. (b. 1894), succeeded to the throne o
the death of his father, George V., Jan. 20
1936; Prince of Wales 1911–36. Abdicated i
favour of his brother H.R.H. the Duke of Yor
Dec. 10, 1936, and was created Duke of Wind
sor. Governor of the Bahamas 1940–45.

Edwin (585–633), King of Northumbria, killed i
battle at Hatfield Chase, Yorkshire, in 633
He was baptised into the Christian faith a
York in 627, and built a church there.

Egbert was a descendant of Cerdic, king of th
West Saxons, and reigned from 802 to 839 i
Wessex; in his later years became the firs
king of all England. In 835 he had to driv
the Northmen away from Cornwall.

Ehrlich, Paul (1854–1914), a noted Germa
scientist who was Director of the Royal Insti
tute for Experimental Therapeutics at Frank
furt-on-Main, which he made famous by hi
experimental laboratory work in connectio
with cancer. His prolonged experimental re
searches brought him world-wide renown, hi
greatest triumphs being the discovery of sal
varsan and neo-salvarsan. He received th
Nobel Prize in 1908.

Eiffel, Alexandre Gustave (1832–1923). Frenc
engineer, one of the first to employ compressed
air caissons in bridge building. Among hi
notable works are the great Eiffel Tower, Pari
(1887–89) and the Panama Canal Locks.

Einstein, Albert (1879–1955), one of the greates
men of science of all time, whose chief claim t
fame rests upon his theories of relativity. H
was born in Ulm of Jewish parents and lived fo
many years in Switzerland. Awarded th
Nobel Prize in 1921 for his work in quantu
theory. In 1933 he was driven by the Nazis t
seek asylum in America and became a professo
at the Institute for Advanced Study at Prince
ton, 1933–45. His works include *Relativit*
(1920), *Zur Einheitlichen Feldtheorie* (1929)
About Zionism (1930), *The Evolution of Physic*
(1938), *The Meaning of Relativity* (1950), *Out o*
My Later Years (1950).

Eisenhower, Gen. Dwight David, G.C.B., O.M. (b
1890), Republican President of the United State
1953–61. Supreme Commander Atlantic Force
in Europe 1950–52. U.S. Chief of Staff, 1945-
48. C.-in-C. Allied Forces, European theatre o
operations, 1943–45, and Allied Forces, N. Afri
ca, 1942–43. Pres. Columbia Univ., 1948–50.

Eisenstein, Sergei Mikhailovich (1898–1948), Rus
sian film director, whose silent film classic *Th*
Battleship Potemkin brought him world-wid
fame. He also produced *Alexander Nevsky* an
Ivan the Terrible.

Eleanor, Queen of Edward I. (d. 1290), was
woman of great piety and devotion. After he
death the king had memorial crosses erected a
the twelve places where her body rested on it
way from Grantham to Westminster.

Elgar, Sir Edward, Bart., O.M., G.C.V.O. (1857
1934), English composer and Master of th
King's Musick, 1924–34. Starting as a violinis
and a teacher, he composed many choral-orche
tral works for various festivals and sprang t
fame with the *Enigma Variations*, music
portraits of his friends. Other composition
include the oratorios, *The Kingdom*, *Th*
Apostles and *The Dream of Gerontius*, and th
tone-poem *Falstaff*. *See* Section E.

Elgin, Thomas Bruce, 7th Earl of, P.C. (1766
1841), a British diplomatist who brought t
England from Athens the famous " Elgi
marbles," now in the British Museum.

Eliot, George (1819–1880), the pen name of Maria
Evans, who produced some of the most memo
able novels of the 19th century, including *Ada*
Bede, *The Mill on the Floss*, *Silas Marne*
Middlemarch and *Daniel Deronda*.

Eliot, Thomas Stearns, O.M. (1888–1965), poet an
critic, one of the foremost literary figures of th
20th century. He was born in St. Loui
Missouri, came to London during the Fir
World War, and became a British subject i
1927. His poems include *Prufrock*, *The Was*
Land, *The Hollow Men*, *Ash Wednesday*, *Fo*
Quartets, and *Little Gidding*; his verse dram
include *Murder in the Cathedral*, and *The Fami*
Reunion. He described himself as " classici
in literature, royalist in politics, and Angl

Catholic in religion." Awarded 1948 Nobel Prize for Literature. *See also* Modern Drama.

izabeth (b. 1900), Queen Consort of George VI., daughter of the 14th Earl of Strathmore. Before her marriage in 1923 she was Lady Elizabeth Angela Marguerite Bowes-Lyon. Chancellor, Univ. of London.

izabeth I. (1533–1603) came to the throne in 1558 at the age of twenty-five, and reigned forty-five years. Was a fervid Protestant, a sincere lover of her country, a masterful and enlightened ruler—fickle as far as her favourites were concerned—and added distinction to a distinguished period. The defeat of the Spanish Armada, the execution of Mary Stuart, the naval supremacy of England, the extension of her colonies, and the glory of a great new literature of which Shakespeare was the brightest ornament are features associated with her reign.

izabeth II. (Elizabeth Alexandra Mary of Windsor) (b. 1926), ascended the throne in February 1952 at the age of twenty-five on the death of her father George VI. Her Consort, Prince Philip, Duke of Edinburgh, is the son of Prince Andrew of Greece and a descendant of the Danish royal family. They have four children, Charles, Prince of Wales (b. 1948), Princess Anne (b. 1950), Prince Andrew. (b. 1960), and Prince Edward (b. 1964).

lis, (Henry) Havelock (1859–1939), literary and scientific writer and an authority on sex.

nerson, Ralph Waldo (1803–1882), the American essayist and philosopher. His *Conduct of Life*, *Representative Men*, and *Essays*, are among the most brilliant literary productions of America.

nin Pasha, the name adopted by Eduard Schnitzer (1840–92), a German explorer associated with Gen. Charles Gordon in the pacification of the Sudan. He joined Gordon's forces as a medical officer and showing marked administrative ability was made governor of the Equatorial Province in 1878. He was menaced by the Mahdi and rescued by Stanley in 1889. While engaged in exploration for Germany in the region of Lake Tanganyika he was murdered by Arabs.

nmet, Robert (1778–1803), the enthusiastic youth who led the rebellion in Ireland in 1803 and was tried and executed in the same year for high treason. He is one of Ireland's patriot heroes.

npedocles (*c.* 500–*c.* 430 B.C.), Greek philosopher, b. Agrigentum in Sicily, founder of a school of medicine which regarded the heart as the seat of life, an idea which passed to Aristotle, as did his idea that all matter was composed of four elements: earth, air, fire, and water. He was also a poet.

gels, Friedrich (1820–1895), Socialist writer and lifelong friend of Karl Marx with whom he collaborated in producing the Communist Manifesto of 1848. *See also* Marxism, J27.

ictetus of Hierapolis, the Stoic philosopher, who lived in the 1st century, and was a moral teacher of great repute and influence.

icurus (342–270 B.C.), the founder of the Epicurean philosophy, which taught that virtue should be followed because it leads to happiness.

stein, Sir Jacob, K.B.E. (1880–1959), sculptor, born in New York of Russian–Polish parents. His work includes *Rima*, the Hudson memorial in Hyde Park; *Day* and *Night* on the building of the Underground Headquarters at St. James' Park; *Genesis*, exhibited in 1931; *Lazarus*, which has a fine setting in New College, Oxford; the *Madonna and Child* group for the restored 18th cent. buildings in Cavendish Square; the figure of *Christ in Majesty*, cast in aluminium, in Llandaff Cathedral; a monumental sculpture for the T.U.C. headquarters in London, and a bronze group depicting St. Michael triumphing over the Devil for Coventry Cathedral, his last major work.

asmus Desiderius (1466–1536), the great Dutch philosopher and scholar, of whom it was said that he " laid the egg which Luther hatched."

hard, Dr. Ludwig (b. 1897), German economist and politician; succeeded Adenauer as Chanc. of the West German Federal Republic, 1963–7.

icsson, John (1803–1889), Swedish engineer who entered into competition with George Stephenson in the first famous trial of locomotives.

rine, St. John Greer (b. 1883), author, dramatist and critic, noted as an able controversialist.

Essex, Robert Devereux, 2nd Earl of (1566–1601), the favourite of Queen of Elizabeth in her old age, son of Walter Devereux (1541–76) and stepson of Leicester. Proved an incapable governor-general of Ireland, returning to England against the Queen's express wish. He was imprisoned and executed for organising a rebellion in London.

Ethelbert, King of Kent at the close of the 6th century and commencement of the 7th. Famous for having accepted Christianity on the entreaty of St. Augustine. Published the first code of written laws in English. Canonised later.

Ethelred II. (*c.* 968–1016), became king of England on the murder of his half-brother, Edward the Martyr (978). He was an incompetent ruler and unable to organise resistance against the Danish raids. Called " the Unready " (from Old Eng. uræd = without counsel).

Ethelwulf was the Anglo-Saxon sovereign who succeeded his father Egbert in 837. Died in 857, and was buried at Winchester.

Etty, William (1787–1848), a famous English R.A., who contributed to the Royal Academy some of its most admired pictures between 1820 and 1849.

Eucken, Rudolf Christoph (1846–1926), a famous German philosopher and theologian.

Euclid (*c.* 330–*c.* 260 B.C.), illustrious Greek mathematician whose *Elements of Geometry* remained a standard text-book until the present century.

Euler, Leonhard (1707–83), Swiss mathematician, regarded as the founder of pure mathematics. He was called by Catherine I. to St. Petersburg, where he became Professor, 1730–41.

Euripides (480–406 B.C.), the greatest of Greek tragic poets. He wrote 92 plays, 18 of which have been preserved, the most famous being *Alcestis*, *Medea*, *Iphigenia*, and *Orestes*.

Eusebius (264–340), an ecclesiastical historian whose *Chronicon* is a history of the world down to his own time, while his *Ecclesiastical History* traces the chief events of the Christian Church.

Evans, Sir Arthur John (1851–1941), distinguished archæologist, chiefly famed for his excavations at Knossos in Crete and his discovery of the pre-Phœnician script.

Evans, Dame Edith Mary, D.B.E. (b. 1888), the versatile and brilliant English actress who made her first appearance as Cressida in *Troilus and Cressida* in 1912. She has played many leading roles and has also appeared in films.

Evatt, Rt. Hon. Herbert Vere, M.A., LL.D. (1894–1965), Australian lawyer and politician; Min. for External Affairs 1941–49; leader of the Federal Labour opposition, 1951–60; Chief Justice, New South Wales, 1960–2.

Evelyn, John (1620–1706), was one of the founders of the Royal Society and wrote several scientific works, but is best remembered for his *Diary* which covers the period 1640–1706.

Eyck, Hubert van (*c.* 1366–1426), and **Eyck, Jan van** (*c.* 1386–1440), two of the greatest masters of the early Flemish School of Painters.

F

Fabius Maximus (Cunctator) (d. 203 B.C.), the Roman Consul and Dictator, saved Rome from conquest by Hannibal by deliberate and well-planned strategic evasion of battle. The term " Fabian Policy " is derived from Fabian's tactics.

Fabre, Jean Henri Casimir (1823–1915), French naturalist whose lifelong interest was the study of the habits of insects and whose observations were delightfully recorded in his *Souvenirs entomologiques*, a work of many volumes.

Faed, Thomas, R.A. (1826–1900), one of the most successful of Victorian painters, won a great reputation for his Scottish subjects.

Fahrenheit, Gabriel Daniel (1686–1736), German physicist, born in Danzig, improved construction of thermometers, notably in using quicksilver for alcohol. Devised the scale with freezing-point at 32° boiling-point at 212°.

Fairbairn, Sir William, 1st Bt., F.R.S. (1789–1874), mechanical engineer and inventor. By the first utilisation of iron in shipbuilding, became eminent and wealthy.

Fairfax, Thomas, 3rd Lord (1612–1671), a prominent leader of the Parliamentary army during the Civil War, who greatly distinguished himself at Marston Moor and Naseby.

Falla, Manuel (1876–1946), Spanish composer whose music is highly individual with a strong folk-song element. His compositions include operas, ballets (*The Three-Cornered Hat* was one of Diaghilev's greatest successes), piano music, pieces for piano and orchestra, songs, harpsichord concerto, and guitar solo in memory of his friend Debussy. *See* Section E.

Faraday, Michael, F.R.S. (1791–1867), great experimental physicist, founder of the science of electro-magnetism. He was the son of a blacksmith and at the age of 12 worked for a bookbinder, to whom he was later apprenticed. Became laboratory assistant to Sir Humphry Davy at the Royal Institution in 1813, and in 1827 succeeded him, becoming professor of chemistry in 1833. He was one of the world's most brilliant experimenters and set himself the problem of finding the connections between the forces of light, heat, electricity, and magnetism. The epoch-making discoveries he made form the basis of the modern electrical industry. He lectured superbly well and inaugurated the Christmas lectures for juvenile audiences at the Royal Institution. Standard biography by L. Pearce Williams (1965).

Farman, Henri (1874–1958), French aviator, one of the pioneers of aviation and a famous designer and builder of aeroplanes.

Farouk I (1920–65), King of Egypt, 1936–52. Forced to abdicate as a result of a military *coup d'état* in July 1952.

Farrar, Very Rev. Frederic William, D.D., F.R.S. (1831–1903), Dean of Canterbury, 1895–1903; a divine and author, some of whose writings attained a large circulation and exercised a considerable influence. His most popular publications were *The Life of Christ*, *The Life and Works of St. Paul*, and *Early Days of Christianity*. Author of the schoolboy story *Eric*.

Faulkner, William (1897–1962), American novelist, recognised as one of the great writers of the century, whose series of novels *The Sound and the Fury*, *As I Lay Dying*, *Light in August*, *Sanctuary* (which brought a Nobel Prize) give a vivid picture of the American South. Other novels include *The Hamlet*, and *The Reivers*.

Fauré, Gabriel Urbain (1845–1924), French composer and teacher; pupil of Saint-Saëns. He was much revered by his pupils at the Paris Conservatoire, among whom was Ravel. His works include chamber music, nocturnes and barcarolles for piano, an opera, *Pénélope*, some exquisite songs, and *Requiem*. *See* Section E.

Fawcett, Rt. Hon. Henry (1833–84), blind Liberal statesman and economist; Prof. of Political Economy at Cambridge. Author of *Manual of Political Economy* (1863).

Fawcett, Dame Millicent Garrett, G.B.E. (1847–1929), widow of the above; educational reformer and leader of the movement for women's suffrage; a very able writer on political economy and one of the founders of Newnham College, Cambridge.

Fawkes, Guy (1570–1606), a Yorkshire Catholic, who with Catesby and other conspirators planned the Gunpowder Plot. Although warned of the discovery of the plot, Fawkes persisted and was captured in the cellar of the Parliament House and hanged. (*See* **Gunpowder Plot**, General Information section.)

Fénelon, François de Salignac de la Mothe (1651–1715), Archbishop of Cambrai and a writer of distinction. His *Telemachus* is a French classic.

Ferdinand V. of Aragon (1452–1516), who married Isabella of Castile, and with her reigned over Spain during a period of great events. He saw the Moors expelled from Spain, equipped Columbus for the discoveries which led to Spain's vast colonial possessions, and instituted the Inquisition.

Ferguson, James, F.R.S. (1710–1776), a Banffshire man of great ability and inventiveness, who, from being a shepherd-boy, educated himself in astronomy, mathematics, and portrait painting, so that he was able to support his parents, and became eminent as a scientific lecturer. He was made a Fellow of the Royal Society.

Fermi, Enrico (1901–54), Italian nuclear physicist whose research contributed to the harnessing of atomic energy and the development of th atomic bomb. Prof. of Physics at Rome Columbia Univ., New York, and Univ. of Chicago. He postulated the existence of the neutrino and discovered the element Neptunium Awarded the 1938 Nobel Prize in Physics.

Festing, Field Marshal Sir Francis Wogan, G.C.B K.B.E., D.S.O. (b. 1902), Chief of Imperi General Staff, 1958–61. During the war h commanded the 36th Division in Burma; know to his troops as the "front line general."

Feuchtwanger, Dr. Lion (1884–1958), German Jewish author famous for his historical novels such as *Jew Süss* and *'Tis Folly to be Wise.*

fforde, Sir Arthur Frederick Brownlow, G.B.E. M.A. (b. 1900), British solicitor and educationis who was Chairman of the B.B.C., 1957–64.

Fichte, Johann Gottlieb (1762–1814): was Professor of Philosophy, first at Jena and then a Erlangen, and later Rector of the University Berlin. His works had great influence upo the thought of his time and prepared the wa for the later Hegelian dialectic.

Field, John (1782–1837), composer and pianist born in Dublin; pupil of Clementi and teache of Glinka. At early age travelled Europe a virtuoso pianist. Composed seven concertos three sonatas, and numerous piano pieces Chopin's nocturnes were modelled on those Field. The later part of his life was spent Moscow, where he died.

Fielding, Henry (1707–1754), a celebrated Englis novelist, author of *Tom Jones*, *Joseph Andrews* and *Amelia*, as well as many plays.

Fields, Gracie, C.B.E. (b. 1898), an inimitabl Lancashire comedienne, and a great popula favourite with the British public. Made he first London appearance in 1915. Equall successful on the films as on the stage, sh gained the affections of her music hall audience through her abundant vitality, her Lancashir humour and her remarkably flexible voice.

Fildes, Sir Luke, K.C.V.O., R.A. (1844–1927), firs attracted notice as a black-and-white artist and illustrated Dickens' *Edwin Drood*. Exhibited at the Royal Academy in 1872, and a successive exhibitions was represented by man important works.

Finsen, Prof. Niels Ryberg (1860–1904), a Danis physician whose light-ray treatment of *lupu vulgaris* won the approval of Queen Alexandr and the aid of many philanthropists. He established in Copenhagen an institute for ligh therapy. Inventor of the Finsen ultra-viole lamp. Awarded 1903 Nobel Prize for Medicin

Firdousi, *nom de plume* of Abdul Kasim Mansur (930–1020), Persian poet whose great epic *Shahnama*, or *Book of Kings*, relates the history Persia in 60,000 verses.

Fisher of Lambeth, Baron (Most Rev. Geoffre Francis) P.C., G.C.V.O., M.A., Hon. D.D. (1887). Archbishop of Canterbury, 1945–61, th 99th holder of the office; Bishop of Londo 1939–45; Bishop of Chester, 1932–39; Headmaster Repton School, 1914–32.

Fisher, Rt. Hon. Herbert Albert Laurens, O.M F.R.S. (1865–1940), English historian an educational reformer; author of *A History Europe*.

Fisher, Professor Sir Ronald Aylmer, Sc.D., F.R. (1890–1962), one of the greatest of Britis scientists who revolutionised both genetics an the philosophy of experimentation by foundin the modern corpus of mathematical statistics.

FitzGerald, Edward (1809–1883). English poet wh gained world-wide fame by his translation the *Rubaiyát* of Omar Khayyam (1859).

Fitzroy, Vice-Admiral Robert, F.R.S. (1805–1865 Attained celebrity as a meteorologist, and 1854 was made superintendent of the Meteorological Department, and was the introducer the system of storm warnings which were th beginning of weather forecasts.

Flammarion, Camille (1842–1925), Frenc astronomer, famous for his observations double stars, star-drift and popular lectures an books on astronomy. Founded the Astronom cal Society of France in 1887. His best-know work is *L'Astronomie Populaire*.

Flamsteed, John, F.R.S. (1646–1719), was the fir English Astronomer Royal, and a close friend Sir Isaac Newton, whom he aided in many his experiments.

laubert, Gustave (1821–80), one of the greatest of French novelists and creator of *Madame Bovary* which took five years to write. His perfection of style was attained only through unremitting effort. Other works were *Salammbo, La Tentation de Saint-Antoine* and his drama *Le Candidat*.

laxman, John R.A., (1755–1826), a great English sculptor who was born at York, and at 20 was employed as modeller by Josiah Wedgwood. In 1787 he went to Rome, where he stayed 7 years. In 1800 he was elected R.A. and in 1810 became professor of sculpture to the Royal Academy.

lecker, James Elroy (1884–1915), English poet whose works include *Golden Journey to Samarkand, Hassan* (staged in London, 1923) and *Don Juan*, as well as many lyrics.

leming, Sir Alexander, F.R.S. (1881–1955), as a bacteriologist he made many original contributions, including the discovery of the antibacterial enzyme lysozyme in 1922 and penicillin in 1928. Full recognition of his discovery came only during the war, when Florey separated the drug now used for treatment from the original penicillin. Awarded Nobel Prize for Medicine jointly with Florey and Chain, 1945.

leming, Sir (John) Ambrose, F.R.S. (1849–1945), British scientist whose invention of the radio valve in 1904 was destined not only to revolutionise radio telegraphy but also to solve the problems which had so far prevented the successful development of radio-telephony, and eventually to make possible the transmission of high-quality speech, music, and even vision signals, and thus lead to broadcasting and television.

letcher, John (1579–1625), the famous collaborator with Beaumont in numerous plays which were popular in their day and take high position in the dramatic literature of the country.

linders, Matthew (1774–1814), an explorer and navigator, who made important discoveries in and around Australia. He sailed through Bass Strait, so called in honour of his surgeon. Sir William Matthew Flinders Petrie (*q.v.*), the archaeologist was his grandson.

lorey, Baron, Howard Walter, O.M. (b. 1898), British pathologist, b. Australia; co-discoverer of penicillin. Shared 1945 Nobel Prize with Fleming and Chain. Pres. Royal Society, 1965.

och, Marshal Ferdinand, O.M. (1851–1929), Generalissimo commanding the Allied Forces in France from April 1918 until after the Armistice was signed, Nov. 11, 1918. Under his direction the great German offensive was checked and turned at the Marne in July 1918. He followed up this success with a series of rapid attacks culminating in the German surrender, Nov. 11, 1918, when he imposed the conditions of the Armistice.

okine, Michel (1880–1944), famous Russian dancer who became choreographer to Diaghilev's company. Creator of *Les Sylphides, Prince Igor, Scheherazade, Firebird*, and *The Spectre of the Rose*.

okker, Anton Hermann Gerard (1890–1939), Dutch (naturalised American) airman and aeronautical engineer, designer and builder of the well-known Fokker triplanes and biplanes employed by the German army.

nteyn, Dame Margot (Mme. Roberto de Arias), D.B.E. (b. 1919), Prima ballerina of the Royal Ballet (formerly Sadler's Wells Ballet) and acclaimed foremost English dancer of to-day.

rd, Henry (1863–1947), founder of Ford Motor Co., 1903, of which he was President until 1919, when he was succeeded by his son, Edsel B. Ford (1893–1943). Henry Ford became the world's leading industrialist and its second richest man. Was the pioneer of the cheap motor-car, of which, since 1920, more than a million have been produced annually.

rester, Cecil Scott (b. 1899), British novelist, author of the *Captain Hornblower* series.

rster, Edward Morgan, C.H., LL.D., C.L. (b. 1879), English novelist whose novels *A Room with a View, Howards End, A Passage to India*, have given him great authority in the world of literature.

scari, Francesco (*c.* 1372–1457), Doge of Venice from 1423 to 1457. A great historical character, who governed Venice with a firm hand and increased her renown.

Fosdick, Rev. Harry Emerson (b. 1878), American Baptist preacher. Professor of Theology, Union Theological Seminary, New York, and Pastor, Riverside, formerly Park Avenue, Baptist Church, New York, 1926–46.

Fourier, François Charles Marie (1772–1837), the famous French socialist, who propounded a system of associated enterprise for giving everyone ample means on a system of communal industry. He made some attempts to carry out his Utopian ideas, but they did not succeed. He is best known by his *Traité de l'Association Domestique Agricole*.

Fowler, Sir John, Bart., K.C.M.G. (1817–1898), an eminent civil engineer, son of a Sheffield land surveyor. With Sir Benjamin Baker he was the engineer of the Forth Bridge and of the Metropolitan Railway.

Fox, Rt. Hon. Charles James (1749–1806) was the second son of the first Lord Holland. Entered Parliament at nineteen, and became a Lord of the Admiralty in 1770. His opposition to the Royal Marriage Bill drew down upon him the displeasure of George III. Through the whole of Pitt's Premiership he was that statesman's most formidiable opponent. He favoured American Independence; opposed the war with France; was one of the impeachers of Warren Hastings; denounced the Slave Trade and advocated Parliamentary Reform. After the death of Pitt in 1806 he was made Foreign Secretary, but died a few months later, and was buried in Westminster Abbey.

Fox, George (1624–1691), was the founder of the Society of Friends.

Foxe, John (1516–1587), the English martyrologist, whose *Acts and Monuments* (*Book of Martyrs*) is one of the best-known books in the language. Born at Boston in Lincolnshire, he became a clergyman of the Anglican Church and died in London.

Frampton, Sir George James, R.A., F.S.A. (1860–1928). English sculptor, best remembered by his Peter Pan statue in Kensington Gardens, and the Edith Cavell Memorial in St. Martin's Place, London.

France, Anatole (Jacques Thibault) (1844–1924), one of France's notable writers of fiction, showing a great mastery of character portrayal and satire. Most of his works are translated into English.

Francis I. (1494–1547), King of France (1515–47). Recovered Milan from Swiss at Marignano (1515). Tried to gain support of Henry VIII (Field of the Cloth of Gold, 1520). Contested supremacy in Europe of Hapsburg emperor, Charles V; defeated and captured at Pavia (1525). French renaissance flourished during his reign.

Francis of Assisi, Saint (1181/82–1226), one of the great Christian saints, founder of the Franciscan Order. Son of a wealthy cloth-merchant of Assisi, he underwent a conversion in 1208 and turned from a life of pleasure to follow the life of the gospel, committing himself to poverty and to the complete observance of Christ's teaching. He and his friars went about preaching the gospel by word and example and the brotherhood increased rapidly in numbers. He received the stigmata (the marks of the five wounds of Christ) on Monte La Verna in Tuscany on 14 Sept. 1224. The last years were spent in illness; he was canonized by his friend Gregory IX two years after his death.

Francis, Sir Philip, K.B. (1740–1818), an English statesman, the reputed author of the famous *Letters of Junius*.

Franck, César Auguste (1822–90), composer and organist, born at Liége in Belgium. From 1872 until his death was professor of organ at the Paris Conservatoire. His music is romantic, mystical, and personal in idiom. Much of his finest composition is for the organ, and his *Symphonic Variations for Piano and Orchestra, Sonata for Violin* and the *Symphony in D* rank him, with his younger contemporary Debussy, among the great 19th-cent. musicians.

Franco, General Francisco (b. 1892), Spanish soldier and Dictator who served with the Spanish Forces in the Moroccan campaign of 1920–23 and was later Head of the Military Academy at Saragossa. Chief of the General

Staff 1935–36. Was Commander-in-Chief of the Nationalist Forces during the Spanish Civil War, 1936–39. President of Spain since Aug. 1939.

Franklin, Benjamin, F.R.S. (1706–1790), the famous American statesman and philosopher, who after serving an apprenticeship as a printer attracted public attention by publishing his *Poor Richard's Almanac.* He then began a series of scientific experiments, inventing among other things the lightning conductor. He was for ten years a member of the General Assembly; then lived in Britain as agent for his State for eighteen years; returning to America he took part in framing the Constitution of the United States.

Franklin, Rear-Admiral Sir John, F.R.S. (1786–1847), the famous Arctic explorer, whose final expedition in command of the *Erebus* and *Terror* ended disastrously, all the members of the expedition perishing. Many attempts were made to discover Franklin, but without obtaining anything save very fragmentary knowledge concerning his fate. He was born at Spilsby.

Franks, Rt. Hon. Sir Oliver Shewell, G.C.M.G., K.C.B., C.B.E., M.A. (b. 1905), British Ambassador to U.S.A. 1948–52; Provost of Worcester College, Oxford, 1962.

Fraser of the North Cape, Admiral of the Fleet, Lord, G.C.B., K.B.E. (b. 1888), commanded Home Fleet, Eastern Fleet, and British Pacific Fleet successively, 1943–46. First Sea Lord, 1948–51.

Fraser of Lonsdale, Ian, Baron, C.H., C.B.E. (b. 1897). Chair. St. Dunstan's since 1921; Pres. British Legion, 1947–58; B.B.C. Gov., 1937–39 and 1941–46. Life peerage conferred, 1958.

Frazer, Sir James George, O.M., LL.D., F.R.S. (1854–1941), was an eminent British anthropologist; author of *The Golden Bough* and numerous other works on his subject.

Frederick I. (*c.* 1123–90), Holy Roman emperor from 1152. Nicknamed Barbarossa. A commanding personality, he won for the empire prestige unknown since Otto the Great. Though failing to subjugate his Italian territories, for his armies suffered from the Italian climate, he dominated his German subjects, expelled the semi-independent Duke of Saxony, Henry the Lion, from his duchy, encouraged the German cities, and was a national hero. Though not an ascetic, he was remarkable for an impeccable private life, distinguished himself on the second Crusade, and was drowned in Asia Minor on his way to the third.

Frederick II. (1194–1250), Holy Roman Emperor, an enlightened ruler whose court in Sicily was a centre of culture and learning, attracting Jewish, Mohammedan, and Christian scholars. Forced by illness to return from crusade in 1227, he was excommunicated by Pope Gregory IX.; still excommunicated, he again set sail for Palestine and by skilful diplomacy gained possession of Jerusalem, Bethlehem, and Nazareth. Frederick was a philosopher and man of science and delighted in exploding superstition. He founded the university of Naples, was a patron of the medical school at Salerno, wrote a treatise on falconry, and gave Sicily a code of laws.

Frederick II. or Frederick the Great (1712–86), King of Prussia (1740–86). By his masterful government and military successes he raised Prussia to the rank of a great power. He was a scholarly potentate, composed music and played the flute.

French, Field-Marshal Sir John. (*See* **Ypres, 1st Earl of.**)

Freud, Sigmund, M.D. (1856–1939), was Professor of Neurology, Vienna University, 1902–38. An eminent psychoanalyst; author of many books on his subject. Left Austria after the *Anschluss* to take up permanent residence in England. An account of Freudian theory will be found in Section F, Part III.

Freyberg, 1st Baron, Lieut.-Gen. Bernard Cyril, V.C., G.C.M.G., K.C.B., K.B.E., D.S.O. (1889–1963), Gov.-Gen. of New Zealand, 1946–52. Served with distinction in both world wars. Commanded Allied troops on Crete, 1941. Won third bar to D.S.O. in Italy, 1945.

Friese-Greene, William (1855–1921), inventor of the cinematograph. His pioneer work in commercial photography brought him no profit, and for many years he lived in poverty.

Frobisher, Sir Martin (1535–1594), was the earliest of British navigators to attempt to find the North-West passage from the Atlantic to the Pacific through the Arctic seas, and his name is commemorated in Frobisher's Strait, to the south of Baffin Land. For his services in connection with the defeat of the Spanish Armada he was knighted.

Froebel, Friedrich Wilhelm August (1782–1852), was the founder of the Kindergarten system of education, the object of which is "to give children employment in harmony with their nature, to strengthen their bodies, to exercise their senses and lead them up to the original ground of all life, to the idea of unity with themselves." *See also* J14(2).

Froissart, Jean (1337–1410), a celebrated French writer who visited England and Scotland, and was the author of the famous *Chronicles*, which tell us so much of the achievements of the barons of old.

Frost, Robert (1874–1963), best loved of American poets. "Stopping by Woods on a Snowy Evening"; "Birches"; "The Death of the Hired Man"; "After Apple-Picking". Awarded Pulitzer Prize for poetry in 1924, 1931, 1937, and 1943.

Froude, James Anthony (1818–1894), the celebrated historian and biographer of Carlyle.

Fry, Christopher (b. 1907), English poet and dramatist of Quaker family. Author of *The Lady's Not for Burning*, *Venus Observed*, and *The Dark is Light Enough.* *See also* Modern Drama.

Fry, Elizabeth (1780–1845), a Norwich lady who devoted much of her life to the promotion of prison reform, and achieved considerable reputation as a preacher. She belonged to the Society of Friends.

Fry, Roger (1866–1934), English art critic and painter. Introduced the work of Cézanne and the post-impressionists into England. His most important book is *Vision and Design* Biography by Virginia Woolf (1940).

Fuchs, Sir Vivian Ernest, M.A., Ph.D. (b. 1908), British geologist and explorer. Dir. of the Falkland Islands Dependencies Scientific Bureau since 1951; leader of the British Commonwealth Trans-Antarctic Expedition 1957–58, the first to cross the Antarctic continent.

Fuller, Thomas (1608–1661), the author of *Worthies of England* and a *Church History of Britain*, two well-known and valuable works.

Fulton, Robert (1765–1815), an inventive American engineer who distinguished himself by experiments in the application of steam to navigation, and finally in 1807, launched the *Clermont* on the Hudson.

Furniss, Harry (1854–1925), British caricaturist, was born in Wexford and came to London as a young man. He was a famous cartoonist and served on the staff of *Punch* from 1878–94. Illustrated the works of Dickens and Thackeray.

Furtwängler, Wilhelm (1886–1954), famous German conductor, and popular in Great Britain for his visits with the Berlin Philharmonic Orchestra, of which he succeeded Herr Nikisch as conductor.

G

Gade, Niels Vilhelm (1817–90), Danish composer, While studying at Leipzig he met Mendelssohn, whom he succeeded as conductor of the Gewandhaus orchestra. He wrote eight symphonies, chamber music, and choral works. Though characteristically Scandinavian, his work shows the influence of German romanticism.

Gagarin, Yuri Alexeyevich (b. 1934), Soviet airman who stirred the imagination of the world on 12 April 1961 by being the first man to be launched into space and brought safely back. His flight was made in the front portion of a Soviet multi-stage rocket which made a single circuit of the earth, the whole adventure taking 108 minutes.

Gainsborough, Thomas, R.A. (1727–1788), English landscape and portrait painter, whose works are remarkable for their grace and refinement He was born in Sudbury in Suffolk, the younges of nine children of a cloth-merchant.

Gaiseric or Genseric (*c.* 390–477), king of the

Vandals, the ablest of the barbarian invaders of the Roman empire. He led his people from Spain into Africa, took Carthage, gained control of the Mediterranean by his pirate fleets, and sacked Rome in 455, thereby bringing about the fall of the western empire.

aitskell, Rt. Hon. Hugh Todd Naylor, C.B.E. (1906–63), statesman and economist; leader of the Labour Opposition, 1955–63; Min. of Fuel and Power, 1947–50; Min. of State for Econ. Affairs, 1950; Chan. of the Exchequer, 1950–51; M.P. (Labour) for South Leeds, 1945–63. He was succeeded as leader of the Labour Party by Harold Wilson. *See also* Section C, Part I.

ale, General Sir Richard, G.C.B., K.B.E., D.S.O., M.C. (b. 1896), Commander of 6th Airborne Div. which landed in Normandy in June 1944; C.-in-C. B.A.O.R., 1952–56; Dep. Supreme Allied Commander Europe (NATO), 1958– .

alen, Claudius (A.D. 131–201), physician, b. Pergamum (Asia Minor) of Greek parents. He systematised medical knowledge in accordance with his idea of purposive creation by the will of God. This unscientific attitude, by discouraging original investigation, hampered medical progress for a thousand years. Many of his treatises still survive.

alileo (1564–1642), great Italian scientist whose experimental-mathematical methods in the pursuit of scientific truth laid the foundations of modern science. He became professor of mathematics at Pisa university when he was 25 and lectured at Padua university for 18 years. He made a number of fundamental discoveries, *e.g.*, in regard to the hydrostatic balance, thermometer, magnet, telescope, and foreshadowed Newton's laws of motion. He detected the four major satellites of Jupiter, the ring of Saturn, and the spots of the sun. He proved the superiority of the Copernican over the Ptolemaic theory, and was imprisoned for so doing. He died the year Newton was born.

alsworthy, John, O.M. (1867–1933), an English novelist and dramatist of force and originality who wrote a great series of novels dealing with the history of an upper middle class family. Awarded Nobel Prize for Literature in 1932.

alton, Sir Francis, F.R.S. (1822–1911), founder of eugenics, cousin of Darwin. His early work, *Meteorographica* (1863), contains the basis of the modern weather chart. He is also remembered for his device of finger-print identification and for being one of the first to apply mathematics to biological problems.

alvani, Luigi (1737–1798), Italian physician and physiologist, whose experiments at Bologna university demonstrated the principle of animal electricity.

ma, Vasco da (*c.* 1460–1524), the adventurous Portuguese navigator who discovered the sea route to India in 1498 by doubling the Cape of Good Hope.

ndhi, Indira (b. 1917), daughter of Nehru, succeeded Shastri in 1966 to become India's first woman Prime Minister; formerly Pres. of Congress Party and Min. of Information.

ndhi, Mohandas Karamchand (1869–1948), great Indian patriot, social reformer, and moral teacher. Believed in the doctrine of non-violence. In the tense situation following the granting of independence to India, he strove to promote the co-operation of all Indians but was assassinated on his way to a prayer meeting.

rbo, Greta (b. 1905), Swedish film actress. The most arresting and poetical actress on the screen of her day.

rcia, Manuel de Popolo Vicente (1775–1832), Spanish tenor, composer, and singing master. His son Manuel Patricio Rodriguez (1805–1906) was tutor to many celebrities including Jenny Lind. Both his daughters (Mme Malibran and Mme Viardot) were celebrated operatic singers.

rdiner, Samuel Rawson (1829–1902), an English historian, whose works deal mainly with the period from the accession of James I. to the end of the Commonwealth. Many of his books remain the standard authorities on their subjects.

ribaldi, Guiseppe (1807–82), Italian soldier and patriot, who with Mazzini and Cavour created a united Italy. In 1834 he was condemned to death for participating in a republican plot to seize Genoa but escaped to S. America. He returned in 1848 to fight for Mazzini but was again forced to flee. In 1851 he returned and gave his support to Cavour, taking part in the Austrian war of 1859. In 1860 with a thousand volunteers he freed Sicily, took Naples and handed over the Two Sicilies to Victor Emmanuel who was proclaimed King.

Garrick, David (1717–1779), the leading tragic actor of his time and a highly successful manager. Was buried in Westminster Abbey.

Garrison, William Lloyd (1805–1879), an eminent anti-slavery leader of America.

Gaskell, Mrs. Elizabeth Cleghorn (1810–1865), English novelist, author of *Mary Barton*, *Ruth Cranford*, and *Life of Charlotte Brontë*.

Gaudi i Cornet, Antonio (1852–1926), Spanish architect of great inventiveness, noted for the fantastic shape and decoration of his buildings which have many qualities in common with *Art Nouveau* (Spanish *modernismo*). He worked mainly in Barcelona.

Gauguin, Paul (1848–1903), influential French artist whose rejection of Western values led to his departure in 1891 for Tahiti where his greatest paintings were done.

Gaulle, Charles André Joseph Marie de (b. 1890), French general and statesman, chosen President of the Fifth Republic, Dec. 1958. On collapse of France in 1940 refused to surrender, but raised and led the Free French fighting forces, with headquarters in England. Took no part in parliamentary life from 1953 until June 1958, when a rebellion of colonists in Algeria brought him to supreme power. His system of government, based on personal prestige and skill in manoeuvre, has carried his country through many crises; the most serious was the army revolt in Algeria in April 1961, which he met and mastered. Repulsed Britain's attempt to enter the Common Market (1963). *See also* Section C.

Gauss, Johann Karl Friedrich (1777–1855), great German mathematician and astronomer. The unit of magnetic induction is named after him.

Gautier, Théophile (1811–1872), French critic, novelist, and poet, at one time secretary to Balzac. His romance, *Mademoiselle de Maupin*, caused a great sensation.

Gay, John (1685–1732), English poet and playwright, famous for *The Beggar's Opera*. He was a writer of great wit and fancy, and much patronised by Society.

Gay-Lussac, Joseph Louis (1778–1850), a French chemist, whose experiments with gases were of much scientific importance.

Ged, William (1690–1749), was one of the inventors of the process of stereotyping. He was a goldsmith and a native of Edinburgh.

Geddes, Sir Patrick (1854–1932), Scottish scientist, professor of biology at Dundee for 30 years and a pioneer in town and regional planning. Invented the term "conurbation". Pubs. *City Development* and *Cities in Evolution*.

Geikie, Sir Archibald, O.M., K.C.B., F.R.S. (1835–1924), noted geologist; President of the Royal Society 1908–13. His brother James Geikie (1839–1915) was a specialist in glacial geology.

Geoffrey of Anjou, Duke of Brittany (1113–51), founder of the Angevin dynasty of England, was son-in-law of Henry I. and father of Henry II., the first Angevin or Plantagenet king.

Geoffrey of Monmouth (1100–1154), was the author of the famous Old English chronicle which bears his name. He was born at Monmouth, and became Bishop of St. Asaph in 1152. His *Chronicon* is a compilation from older authors, and is notable for having contained the stories of King Arthur, King Lear, and Cymbeline.

George I. (1660–1727) was King of Great Britain from 1714 to his death, ascending the throne as direct descendant of James I. His reign saw many memorable events, including the Jacobite Rebellion, the South Sea Bubble, and the beginning of Walpole's great ministry.

George II. (1683–1760), son of the last-named, was King of Great Britain from 1727 to 1760. His reign covered a prosperous period in spite of wars and rebellions, and saw the Empire extended in India and North America, though he himself was a man of limited powers.

George III. (1738–1820), grandson of George II., reigned 1760–1820. In this period came the King's clash with John Wilkes over foreign policy, the loss of the American colonies, the prolonged war with France, England's agrarian and industrial revolutions, the spread of Methodism. In 1966 two British psychiatrists published convincing evidence that the King's long mental illness was due not to insanity but to acute intermittent porphyria, an inborn error of metabolism.

George IV. (1762–1830) eldest son of George II, reigned 1820–30, having become Prince Regent in 1812. The monarchy remained at a low ebb and was not to recover until after the accession of Victoria. Though styled "the first gentleman of Europe", his personal conduct, especially in marital affairs, showed a want of dignity. But he is now remembered for his interest in art and architecture.

George V. (1865–1936), was the second son of Edward VII. and Queen Alexandra. Entered the Navy as a cadet in 1877 and became second in the line of succession to the throne on the death of the Duke of Clarence in 1892. Married to Princess Mary of Teck in 1893. Succeeded to the throne May 6th, 1910, and celebrated his Silver Jubilee in 1935. Maintained the royal tradition of strenuous public engagements combined with unfailing attention to business of State.

George VI. (1895–1952), (Albert Frederick Arthur George of Windsor), second son of George V., was called to the throne in December 1936 on the abdication of his elder brother, Edward VIII. His reign was marked by the ordeal of war, by world revolution and social change and at the same time by a remarkable degree of constitutional harmony which his fine example and personal qualities did much to achieve.

George, Henry (1839–1897), American political economist whose "single tax" on land values as a means of solving economic problems is expounded in his *Progress and Poverty*, pub. 1879.

George, Saint, the tutelary saint of England, adopted by Edward III. He is believed to have been a native of Cappadocia and a vigorous champion of Christianity in the days of Diocletian, and to have suffered martyrdom at Nicomedia 303 A.D. The dragon which he is said to have slain symbolises the powers of evil over which he triumphed.

German, Sir Edward (1862–1936), English composer, best known for his incidental music and light opera *Merrie England*. (His name was originally Edward German Jones.)

Gershwin, George (1898–1937), American jazz pianist and song-writer, composer of the famous *Rhapsody in Blue* and other works including the negro "folk-opera" *Porgy and Bess*.

Gesner, Konrad von (1516–1565), a scholarly Swiss naturalist, and father of the science of zoology.

Ghiberti, Lorenzo (1378–1455), Florentine sculptor whose bronze doors, beautifying the baptistery in Florence, were described by Michaelangelo as fit for the gates of paradise.

Giacometti, Alberto (1901–66), Swiss sculptor and painter. He settled in Paris in 1922 and is considered one of the most important artists of modern times.

Gibbon, Edward (1737–1794), celebrated historian of the *Decline and Fall of the Roman Empire*.

Gibbons, Grinling (1648–1720), the celebrated wood-carver and sculptor, was born at Rotterdam and was brought to the notice of Charles II. by Evelyn, the diarist. The choir stalls of St. Paul's and the carving in the Wren library at Trinity College, Cambridge, are his work.

Gibbons, Orlando (1583–1625), a noted English composer of Church music who was organist of the Chapel Royal.

Gide, André Paul Guillaume (1869–1951) French man of letters, novelist, dramatist and poet. Awarded the Nobel Prize for Literature in 1947.

Gielgud, Sir (Arthur) John (b. 1904), English actor, member of the Terry family. Began by walking on at the Old Vic, and, later, became a Shakespearian actor, making a marked success as Hamlet, Richard II., and Prospero.

Gigli, Beniamino (1890–1957), the great Italian operatic tenor of the Metropolitan Opera House New York. The possessor of a voice of great natural beauty and one of the finest exponents of the music of Puccini and Verdi.

Gilbert, Sir Alfred, M.V.O., R.A., (1854–1934), sculptor and designer of gold and silver objects. Among his best-known sculptures are *Perseus Arming*, *Icarus*, *Eros* in Piccadilly Circus, the Shaftesbury Memorial and the Duke of Clarence Memorial at Windsor.

Gilbert, Sir Humphrey (1539–1583), knighted by Queen Elizabeth for his bravery in Ireland, later made voyages of discovery, and added Newfoundland to the British possessions.

Gilbert, Sir John, R.A. (1817–1897), English painter, one of the chief artists on the *Illustrated London News*, and noted for his illustrations to Staunton's edition of Shakespeare.

Gilbert, William (1543–1603), physician to Queen Elizabeth I., has been called the father of electric and magnetic science. Published his great book on the magnet in 1600.

Gilbert, Sir William Schwenck (1836–1911), English humorist and playwright, is best remembered for the "Bab Ballads" and for the famous Savoy series of operas in which he collaborated with Sir Arthur Sullivan. Among the operas are *H.M.S. Pinafore*, *Patience*, *Iolanthe*, *The Mikado*, *The Gondoliers*, and *The Yeomen of the Guard*. The Gilbertian humour of plot and paradox, the kindly satire and the delightful metres combine with Sullivan's music to make the operas unforgettable and ever popular.

Gill, Arthur Eric Rowton, A.R.A. (1881–1940), English sculptor and engraver, whose works include the *Stations of the Cross* (Westminster Cathedral), *Prospero and Ariel* (Broadcasting House), *Christ Driving the Money-changers from the Temple* (Leeds University). He also worked as a designer for printing (Gill Sans type) and the George VI stamps were his designs.

Gillray, James (1757–1815), the eminent caricaturist of the time of George III., who produced upwards of a thousand political cartoons.

Giotto di Bondone (*c.* 1266–*c.* 1337), great Florentine artist, the first to break away from byzantine tradition and paint in a naturalistic way. Much of his work has perished but still surviving are the great frescoes in the churches of Assisi, Padua, and Florence. He designed the western front of the cathedral at Florence and the campanile, the lower part of which was completed from his designs before his death.

Gissing, George Robert (1857–1903), English author whose novels deal with poverty and the sociological problems of his day. *New Grub Street*, *The Unclassed*, *Charles Dickens*, *A Critical Study*, *The Private Papers of Henry Ryecroft* are among his best-known works.

Giulio Romano or Giulio Pippi (*c.* 1492–1546) was a pupil of Raphael, and himself a distinguished painter and architect.

Gladstone, Rt. Hon. William Ewart (1809–98), the great Liberal statesman of the latter part of the nineteenth century, popularly known as the Grand Old Man. Entered Parliament in 1832 as a Tory, held various offices under Peel, and joined the Aberdeen coalition in 1852. From that time he served several terms as Chancellor of the Exchequer and was Liberal Prime Minister, 1868–74, 1880–85, 1886, and 1892–94. His financial policy was able, accurate, lucidly exposed, and very successful. His first ministry was active, its legislative achievements including the Disestablishment of the Church of Ireland, the Education Act of 1870, the Ballot Act of 1872, and the Irish Land Act, but in 1873 they were aptly described by Gladstone's great rival, Disraeli, as "exhausted volcanoes." His second ministry, returned to power after the astonishing Midlothian campaign, witnessed the defeat by the Boers at Majuba, the bombardment of Alexandria, and the disaster of General Gordon at Khartoum. His last two ministries were marked by the adoption of the policy of Home Rule for Ireland, which he was unable to carry. Gladstone was a good classical scholar and an earnest high churchman, who in 1838 published the *State in its Relations with the Church*, a work of considerable interest.

Glazunov, Alexander Constantinovich (1865–1936), Russian composer, pupil of Rimsky-Korsakov. He was an accomplished and prolific composer, the first of his eight symphonies being composed when he was only 16.

Glendower, Owen (1359–1415), a famous Welsh chieftain who proved a formidable opponent to Henry IV., and gathered around him a great following of Welshmen, whom he led with much bravery, though finally defeated in 1405.

nka, Mikhail Ivanovich (1804–57), Russian composer whose music has a strong folk-song element. Notable among his works are his two operas, *A Life of the Tsar* and *Russlan and Ludmilla*, based on a poem by Pushkin. He is recognised as the first of the Russian national school. *See* Section E.

uck, Christoph Willibald (1714–87), German composer, a figure of great historical importance in the development of the opera. He was the son of a Bohemian forester and studied in Prague, Vienna, and Italy. His first operas were in the Italian tradition, but with *Orfeo ed Euridice* (1762), inspired by classical Greek drama, he began his reform of the opera. Then followed the great operas *Alceste*, *Armide*, and *Iphigénie en Tauride* (1779), which is considered his masterpiece. *See* Section E.

ddard, Lord, P.C., Q.C. (b. 1877), Lord Chief Justice of England, 1946–58.

dfrey of Bouillon (c. 1061–1100) was the leader of the First Crusade, and after the conquest of Jerusalem, exchanged the title of King for that of "Protector of the Holy Sepulchre." He liberated the Holy Land, and was buried on Mount Calvary.

diva, Lady (1040–1080), was the pious and beautiful wife of Leofric, Earl of Chester and Lord of Coventry. Having appealed to her lord to remit certain impositions from the inhabitants, he promised to grant her request if she would ride naked through the town. This she did, says the legend, having first passed the word to have blinds and shutters drawn at the appointed hour, and so obtained the people's ransom.

dwin, Earl of the West Saxons (990–1053), was one of the most influential noblemen of his time and gave his daughter in marriage to Edward the Confessor, against whom he was afterwards in rebellion. Godwin's son, Harold, claimed the throne after Edward's death, but was killed at Hastings.

dwin, William (1756–1836), English Radical philosopher, author of *Political Justice* and a novel, *Caleb Williams*. Married Mary Wollstonecraft (1759–97), author of *A Vindication of the Rights of Women*, in which she pleaded for the equality of the sexes, particularly in education. Their daughter, Mary Wollstonecraft Godwin (1797–1851), married the poet, Shelley, and was the author of *Frankenstein*.

ethe, Johann Wolfgang von (1749–1832), German poet of great gifts and versatility. Born at Frankfurt on Maine of a cultivated and well-to-do family, he was able to integrate all the powers with which nature had endowed him in one harmonious personality. Before he went to Weimar at the age of 25 he had written *Götz von Berlichingen* and *Werthers Leiden* and many beautiful lyrics. He settled at Weimar in 1775, received a Ministerial appointment and actively interested himself in the welfare of the state. *Faust*, the great dramatic poem which accompanied him from early manhood to the end, epitomises his whole life and was his crowning achievement. Not only was he a great poet, but scientist and philosopher besides.

gol, Nikolai Vasilievich (1809–52), one of the greatest of Russian novelists whose stories of provincial life are in the same setting as his *Dead Souls* (1842), a masterpiece of humour. Another masterpiece is his play *The Government Inspector* (1836), a satire on provincial bureaucracy. An artist of supreme originality.

dsmith, Oliver (1728–1774), the celebrated author of *The Vicar of Wakefield*, *The Deserted Village*, and *She Stoops to Conquer*. The son of a poor Irish curate, he found his way to London in 1756, subsequently devoting himself entirely to literature, being befriended by Dr. Johnson and held in great esteem by Reynolds, Burke and other eminent men of the time. He was buried in the churchyard of the Temple.

odyear, Charles (1800–1860), an American, discoverer of the art of vulcanising rubber, by which the utility of the material was greatly extended.

ossens, Sir Eugène (1893–1962), English composer and conductor of Belgian parentage. He was associated with many famous orchestras, and his compositions include the operas *Judith* and *Don Juan de Mañara*. His brother Léon is a celebrated oboe virtuoso, both his sisters are gifted harpists, and his father and grandfather, who also bore the name Eugène, were conductors.

Gordon, Adam Lindsay (1833–1870), an Australian poet who wrote many stirring ballads and poems, his *Bush Ballads and Galloping Rhymes* being a great success.

Gordon, Major-General Charles George, C.B. (1833–1885), a distinguished soldier, administrator, and earnest Christian, who had a most adventurous, useful, and self-sacrificing career. He saw active service in the Crimea, China, and India, and in 1873 was made Governor of the Equatorial provinces of Egypt. In 1877 he went out to the Sudan for the Egyptian Government, and in 1884 again proceeded thither on behalf of the English Government to deal once more with the difficulties which had arisen consequent on the Mahdi's Rebellion. While defending Khartoum he was murdered by the Mahdi's forces on the palace staircase.

Gordon, Lord George (1751–1793), was tried for treason as the instigator of the Anti-Popery riots of 1780, but acquitted on the ground that he had no treasonable intention. Some years later he was committed to Newgate for libelling Marie Antoinette and died there of fever.

Gorky, Maxim (pseudonym of Alexey Maximovich Peshkov) (1868–1936), great Russian writer and playwright. Worked in a variety of trades from the age of ten—shoemaker's apprentice, scullion on a Volga steamboat, birdwatcher, baker, fisherman, railway guard—during which time he learned to write. His early years are described in *My Childhood* (1913). His first story was published in 1892. His works are noted for their vividly drawn characters and social realism.

Gosse, Sir Edmund, C.B., LL.D., Litt.D. (1849–1928), a distinguished poet and critic who wrote lives of Gray, Congreve and Dr. Donne, and his *History of 18th Century Literature* and *History of Modern English Literature* show great critical power and appreciation. Was librarian to the House of Lords 1904–14, and wrote a book on French literary men and a life of Sir Thomas Browne. In 1907 he published *Father and Son*, being recollections of his father.

Gould, Sir Francis Carruthers (1844–1925). Perhaps the cleverest political caricaturist of his day, and did also considerable journalistic work as assistant editor of the *Westminster Gazette*.

Gounod, Charles François (1818–93), French composer whose fame rests chiefly on his operas *Faust* and *Roméo et Juliette*, though his lyrical gifts are best shown in some of his earlier works, such as *Le Médicin malgré lui* and *Mireille*. He also wrote oratorios and church music.

Gower, John (1325–1408), an English poet of the time of Chaucer, who wrote many elegant ballads and devotional poems. His *Confessio Amantis* was his outstanding work.

Goya y Lucientes, Francisco José (1746–1828), a famous Spanish painter and etcher, and one of the greatest artists of all time, renowned for his wonderful series of etchings and satirical drawings. His portraits can only be described as ruthless in their realism, and his etchings in the *Horrors of War* tell of his hatred of the cruelty and reaction in his own country. In addition to portraits and genre he painted frescoes in the Cathedral at Saragossa. England's first exhibition of his art was held in 1963.

Grace, Dr. William Gilbert (1848–1915), renowned and almost legendary cricketer who by his character and skill dominated English cricket for over forty years, and was probably the best-known man in England. Altogether in first-class cricket he scored 54,896 runs, including 126 centuries, and took 2876 wickets. Scored 1000 runs in May 1895; and three times made over 300 runs in an innings.

Graham, John, of Claverhouse, Viscount Dundee (1643–1689). Renowned for his sturdy adherence to the Stuarts, and headed a rebellion in Scotland against William and Mary, but was killed at the Battle of Killiecrankie.

Grahame, Kenneth (1859–1932), as a writer of books for children ranks almost with Lewis Carroll. *The Golden Age*, *Dream Days*, and *Wind in the Willows*, all achieved great popularity.

Grahame-White, Claude (1879–1959), aviator and engineer, the first Englishman to gain an aviator's certificate, 1909; won the Gordon Bennett Cup with the then record speed of 60¼ miles per hour in 1910, founded the first British Flying School and published many works on aircraft.

Grainger, Percy Aldridge (1882–1961), pianist and composer, b. in Australia, U.S.A. citizen. He was a brilliant player and an authority on folk-song, the influence of which is apparent in all his compositions.

Grant, General Ulysses Simpson (1822–1885), the most distinguished American general of the Civil War. President of the United States from 1869 to 1877.

Granville-Barker, Harley, D. Litt., LL.D., F.R.S.L. (1877–1946), distinguished English dramatist, producer, and actor. Introduced plays of Ibsen and Shaw to British public. His own plays reflect influence of Shaw, and are particularly notable for their realistic dialogue.

Grattan, Henry (1746–1820), an Irish orator and statesman who, first in the Irish Parliament and afterwards in the Imperial Parliament, did memorable work for the cause of his country.

Graves, Robert Ranke (b. 1895), English poet and writer. His most famous work, apart from his poems, is *Goodbye to All That*, written after the first great war. Succeeded Auden as Prof. of Poetry at Oxford, 1961–66.

Gray, Thomas (1716–1771), the English poet, whose *Elegy written in a Country Churchyard* is one of the most beautiful in the language. His other poems were not numerous but included a fine *Ode on a Distant Prospect of Eton College* and a notable *Ode to Adversity*.

Greeley, Horace (1811–1872), founder of the *New York Tribune* and a political writer of great power and influence. Was an unsuccessful candidate for the United States Presidency in 1872.

Green John Richard (1837–1883), an eminent English historian. Published a *Short History of the English People* in 1874.

Greenway, Kate (1846–1901), a gifted book illustrator and water-colour artist, whose drawings of children won her great popularity and the warm approval of no less a critic than Ruskin.

Greene, Graham, C.H. (b. 1904), English novelist and journalist whose novels (*The Heart of the Matter, Brighton Rock, The Quiet American, Our Man in Havana, A Burnt-out Case*), like his plays (*The Complaisant Lover*), and films (*Fallen Idol, The Third Man*), deal with moral problems in a modern setting from a Catholic standpoint.

Gregory, St. (257–336), was founder of the Armenian Church, and spent his last years in a cave at the foot of Mount Sebuh.

Gregory the Great, St. (*c.* 540–604), Pope 590–604. The last great Latin Father and the forerunner of scholasticism. The real founder of the temporal power and the political influence of the papacy, he also maintained the spiritual claims of Rome, enforcing discipline, encouraging monasticism, defining doctrine, and adding to the music, liturgy, and canons of the Church. Thus he exerted enormous influence on the life and thought of the Middle Ages.

Gregory VII (*c.* 1020–85), Pope from 1073. Originally called Hildebrand. Battled for papal omnipotence within the Church, stamping on simony and the marriage of priests. His victory in the conflict of empire and papacy came when the emperor, Henry IV, did penance for three days in the snow at Canossa, but had the unfortunate result of leading to further internal dissensions in Germany and to papal absorption with power politics rather than to Gregory's aim of an ideal theocracy embracing all States.

Gregory XIII (1502–85), Pope, 1572–85; introduced the Gregorian calendar.

Grenville, Sir Richard (1541–1591), the Elizabethan sea-captain, who with his one ship engaged a fleet of Spanish war-vessels off Flores, in 1591, was captured and shortly after died on the Spanish flagship *San Pablo*, an exploit celebrated in Tennyson's noble ballad, *The Revenge*.

Gresham, Sir Thomas (1519–1579), was the wealthiest London merchant and financier of his time. He built the first Royal Exchange and founded Gresham College. The son of Sir Richard Gresham (Lord Mayor of London), he succeeded his father as King's Agent at Antwerp, and proved an astute money-finder for the Court in four successive reigns, ending as Queen Elizabeth's "Royal Merchant."

Greuze, Jean Baptiste (1725–1805), French painter, whose works, especially his studies of girls, display much delicacy and beauty of handling.

Grey, Charles, 2nd Earl, K.G. (1764–1845), a great English Whig statesman under whose Premiership were passed the Reform Bill of 1832, the Bill abolishing slavery throughout the British Empire (1833), and the Poor Law Amendment Act, 1834.

Grey, Lady Jane (1537–1554), was the daughter of the Duke of Suffolk and great-granddaughter of Henry VII. On the death of Edward VI, she was proclaimed Queen, but only reigned for nine days, Queen Mary ousting her and maintaining the Tudor succession. Six months later Lady Jane and her husband, Lord Guildford Dudley, were executed.

Grey of Fallodon, 1st and only Viscount, K.G., P.C. (1862–1933). Under-Secretary for Foreign Affairs, 1892. Foreign Secy., 1905–16. He won high approval for his handling of the Balkan difficulties of 1912–13, and all through the difficult strain which preceded Germany's rush into war acquitted himself with force and dignity. Leader of Liberal Party in House of Lords until Aug. 1924. Chancellor of Oxford Univ., 1928–33.

Grieg, Edvard Hagerup (1843–1907), a Norwegian musical composer, who presented the characteristics of his country's music in numerous compositions of great melodic beauty.

Griffin, His Eminence Cardinal Bernard William (1899–1956), Roman Catholic Archbishop of Westminster from 1944 until his death.

Griffith, Arthur (1872–1922), was the first President of the Irish Free State 1921; founder and first editor of *Sinn Fein* 1906–15, and founder of the *Sinn Fein* movement.

Griffith, David Wark (1880–1948), pioneer American film producer. Noted especially for his remarkable films *Broken Blossoms* and *The Birth of a Nation*. Invented much of the technique of the modern cinema.

Grimm, the brothers Jakob Ludwig Karl (1785–1863) **and Wilhelm Karl** (1786–1859), German philologists and folk-lorists who wrote the world-famous *Fairy Tales*. They planned a gigantic etymological dictionary of the German language, which was completed by German scholars in 1961.

Grimond, Rt. Hon. Joseph (b. 1913), Leader of the Liberal Parliamentary Party 1957–67; Liberal M.P. for Orkney and Shetlands since 1950; Liberal Chief Whip, 1951–57.

Grimthorpe, 1st Baron, LL.D. (1816–1905), long known as **Sir Edmund Beckett, Bt., K.C.**, was a great authority on horology, and, with Professor Sir George Airy (*q.v.*), designed "Big Ben." He restored St. Albans Cathedral at his own cost

Gromyko, Andrei A. (b. 1908), Russian diplomat; Foreign Minister, 1957–. Ambassador to Britain, 1952–3, and to the U.S.A., 1943–46 Representative of the Soviet Union on the U.N Security Council, 1946–49.

Grossmith, George (1847–1912), the well-known actor and entertainer. His father, George Grossmith the elder, was also a popular entertainer and lecturer, his brother, Weedon Grossmith, was an actor and artist of considerable attainments, and his son, George Grossmith (1874–1935), was a successful comedian, and the first to introduce revue and also cabaret entertainment into England.

Grote, George (1794–1871), English historian famous for his *History of Greece*, 1846–56, an epoch-making and standard work.

Grotius, Huig van Groot (1583–1645), Dutch jurist the founder of international law. He was condemned to life imprisonment for supporting religious toleration but made a daring escape and found refuge in Paris, where he wrote his masterpiece *De Jure Belli et Pacis*.

Grouchy, Marshal Emmanuel, Marquis de (1766–1847), a famous Napoleonic general who, at Hohenlinden, Wagram, and in the Moscow retreat rendered signal service. After Waterloo he led the defeated army back to Paris.

Grove, Sir George (1820–1900) was a distinguished engineer and bridge and lighthouse builder, but better known as an enthusiastic lover of music the study and performance of which in England he did much to promote. His *Dictionary of Music and Musicians* is a standard work.

1edalla, Philip, M.A. (1889–1944), was an English historian and essayist. Author of *The Partition of Europe* (1914), *The Second Empire* (1922), *Palmerston* (1926), *The Missing Muse* (1929), *The Duke* (1931), and other works.

iido Reni (1575–1642), Italian painter of the Bolognese school whose works are characteristic of the Italian baroque art of his period and include the famous *Aurora* fresco in the Rospigliosi palace at Rome, and *Crucifixion of St. Peter* (Vatican).

istavus Adolphus, King of Sweden (1594–1632), the " Lion of the North," after a lengthy campaign in Poland, entered the Thirty Years' War in support of Swedish interests and Protestant distress, won the Battle of Breitenfeld in 1631, and was killed in action the next year.

itenberg, Johann (*c.* 1400–68), German printer, b. Mainz, the first European to print with movable types cast in moulds. The earliest book printed by Gutenberg was the Mazarin Bible (L76).

iy, Thomas (1644–1724), founder of Guy's Hospital, was a dealer in Bibles, speculator and money-lender, who after making a large fortune, bequeathed £300,000 for the erection and endowment of the famous hospital.

vynne, Nell (1650–1687) English actress; as a girl, orange-seller near Drury Lane Theatre; favourite mistress of Charles II. Her eldest son was made Duke of St. Albans.

H

akon VII. (1872–1957), King of Norway. Formerly Prince Carl of Denmark, second son of Frederick VIII.; elected to the throne on the separation of Norway from Sweden in 1905. Married Princess Maud, youngest daughter of King Edward VII. in 1896.

dfield, Sir Robert Abbott, Bt., F.R.S. (1858–1940), English metallurgist whose discovery of manganese steel in 1882 brought him recognition from every steel-producing country.

drian (76–138) was Emperor of Rome in succession to his uncle Trajan, and one of the greatest of Roman rulers. He visited Britain, and in A.D. 121 built the wall between Newcastle and Carlisle for protection of his dominions against the Picts and Scots.

fiz, pseudonym of Shams ad-Din Mohammed (1320–1389), great Persian lyrical poet. His principal work is the *Divan*, a collection of short sonnets called *ghazals*. The sobriquet *Hafiz*, meaning one who remembers, is applied to any one who has learned the Koran by heart.

hnemann, Samuel Christian Friedrich (1755–1843), the German physician who founded the system of homoeopathy. Dissatisfied with the state of medicine at the time, he set himself the task of formulating general principles governing the restoration of health. Homoeopathy is based on the principle that diseases should be treated by drugs which when given to a healthy person provoke symptoms similar to that of the disease to be treated. His second principle was that drugs should be given in almost infinitesimal doses.

ig, Field-Marshal, 1st Earl of Bemersyde, K.T., G.C.B., O.M., G.C.V.O., K.C.I.E. (1861–1928), C.-in-C. of the British Expeditionary Forces in France and Flanders, 1915–19.

ile Selassie I., G.C.B., G.C.M.G., G.C.V.O. (b. 1891), Emperor of Ethiopia, April 1930 to May 1936, and since May 1941.

kluyt, Richard (1553–1616), the first of English naval historians. By his *Divers Voyages touching the Discovery of America*, and *Principal Navigations, Voyages, and Discoveries of the English Nation*, did much to help forward the colonising spirit.

ldane, John Burdon Sanderson (1892–1964), biologist and geneticist, noted not only for his influence in his special field of mathematical evolutionary theory but for the use he made of his great gifts in explaining science to the layman. He held the Chair of Biometry at University College, London, from 1937 until 1956. Emigrated to India in 1957. He was the son of John Scott Haldane (1860–1936) whose researches led to improvements in public health and industrial safety.

Haldane, Viscount, P.C., K.T., O.M., F.R.S. (1856–1928), sat for Haddingtonshire, 1885–1911. In 1901 was Vice-President of the Liberal Imperialist League, and at the close of 1905 was made War Minister and organised the Territorial Force. Lord Chancellor, 1912–15, and again in first Labour Government, 1924.

Halévy, Ludovic (1834–1903), a brilliant French writer who supplied Offenbach with libretti for some of his most famous comic operas: among them *La Belle Hélène*, *La Grande Duchesse*, and *Barbe Bleue*. In conjunction with Meilhac he wrote several notable plays of which *Frou-frou* was perhaps the most successful.

Halifax, Charles Montague, Earl of (1661–1715), seventeenth century financier who was responsible for the National Debt, the window tax, the revaluation of the currency, and the foundation of the Bank of England.

Halifax, 1st Earl of, Edward Frederick Lindley Wood, K.G., P.C., O.M., G.C.S.I., G.C.I.E., T.D. (1881–1959), filled many difficult positions with distinction and success and was especially notable as Viceroy of India, 1926–31, Foreign Secretary, 1938–40, and British Ambassador in Washington, 1940–45. He wrote a life of John Keble and was prominent in the life of the Church of England. Chancellor of Oxford University 1933–59.

Halifax, George Savile, Marquess of (1633–95), author of *Advice to a Daughter* and *Character of a Trimmer*, was a gifted and independent politician, pamphleteerist, and orator.

Hallam, Henry (1777–1859), a graceful and scholarly historian who contributed several important works. His *View of the State of Europe during the Middle Ages*, *Constitutional History of England*, and *Introduction to the Literature of Europe* are distinguished for their clearness of style and correctness of judgment.

Hallé, Sir Charles (1819–1895), a distinguished pianist and conductor who was born in Westphalia. Went to Paris to study music in 1836, and in 1848 settled in London, where he soon became known as a piano-player of the first rank. He organised an orchestra of high-class talent, and for many years conducted it in London and the provinces. He married Madam Norman Neruda (d. 1911), the celebrated violinist in 1888, and was knighted the same year.

Halley, Edmund, F.R.S. (1656–1742), English Astronomer Royal from 1720 to his death and ranked next to Newton among the scientific Englishmen of his time. Made first magnetic survey of the oceans from the naval vessel *Paramour*, 1698–1700. Discovered what is known as Halley's comet.

Hals, Franz (1584–1666), a famous painter of the Dutch School, who is represented in the leading galleries of Europe. The Wallace Collection has his world-famous picture, the *Laughing Cavalier*.

Hamilton, Alexander (1757–1804), American statesman and economist, opponent of Thomas Jefferson, served as Secretary of the Treasury in Washington's cabinet, 1789–95. Though a monarchist by predilection, he urged the adoption of the Constitution, and in conjunction with Maddison and Jay wrote the *Federalist*.

Hamilton, Emma Lyon, Lady (1761–1815), was a woman of humble birth and great personal beauty who attained prominent notice by her association with Sir William Hamilton, British Ambassador at Naples, who married her, and afterwards with Lord Nelson, who conceived an infatuation for her.

Hammarskjöld, Dag Hjalmar Agne Carl (1905–1961), Sec.-Gen. of the United Nations, 1953–61. Killed in air crash on way to the Congo to end dispute between central government in Leopoldville and M. Tshombe of Katanga province. Posthumously awarded 1961 Nobel Peace Prize.

Hammond, John Lawrence Le Breton (1872–1949), English journalist and historian whose works on social and industrial history, written mainly in collaboration with his wife, Barbara Hammond, include *The Village Labourer*, 1911; *The Town Labourer*, 1917; *The Skilled Labourer*, 1919; and *The Age of the Chartists*, 1930.

Hampden, John (1594–1643), English patriot who opposed Charles I.'s " Ship Money " tax, and by his resistance and eloquent advocacy of the wish of the people helped the Parliamentary cause.

Hamsun, Knut, pen-name of **Knut Pedersen** (1859–1952), Norwegian author and farmer, who in his youth struggled for existence, visited America twice and earned his living by casual labour. His monumental work, *Markens Gröde* (*Growth of the Soil*), gained him the Nobel Prize in 1920.

Handel, George Frederick (1685–1759), German composer, son of a barber-surgeon to the Duke of Saxony; born the same year as Bach. He spent much of his life in England composing operas and achieving world-wide fame by his magnificent series of oratorios. His operas, of which there are over forty, include *Atalanta*, *Berenice*, and *Serse*, and his oratorios, of which there are thirty-two, include *Saul*, *Israel in Egypt*, *Samson*, *Messiah*, *Judas Maccabaeus*, and *Jeptha*. He also composed chamber music, *concerti grossi*, music for chorus and orchestra, solo cantatas, harpsichord suites, and much other beautiful and noble music. Beethoven said of Handel, "Go and learn of him how to achieve great effects with simple means." Eight years before he died he became totally blind and relied upon his old friend and copyist John Christopher Smith to commit his music to paper. He was buried in Westminster Abbey. *See* Section E.

Hannibal (247–183 B.C.), the renowned Carthaginian general, who led an army against Rome, and achieved many notable victories over superior numbers. Was defeated by Scipio at the Battle of Zama, and afterwards suffered exile, and poisoned himself.

Harcourt, Rt. Hon. Sir William Vernon, F.R.S. (1827–1904), barrister, author, Liberal statesman, an enthusiastic supporter of Mr. Gladstone.

Hardicanute (1019–1042), son of Canute the Great, was King of England from 1040 to 1042, and imposed the tax called Danegeld. He was the last Danish sovereign of this country.

Hardie, James Keir (1856–1915), a Socialist politician and Labour representative who acted as editor of the *Miner* and the *Labour Leader* from 1887 to 1904. He is regarded as the founder of the Labour Party. During his early life he worked in a Scottish coal pit, but in 1882 became a journalist, and entered Parliament as member for West Ham (South) in 1892–95, being the first Socialist to be elected to the House of Commons. First Chairman of the Parliamentary Labour Party, 1906–8, M.P. for Merthyr Tydvil from 1900 till his death.

Hardy, Thomas, O.M. (1840–1928), was educated as an architect and practised for some time, but became known as a promising novelist in 1871 with his story *Desperate Remedies*. In 1874 his *Far from the Madding Crowd* was published, which at once made him a name. Following that, at short intervals, came a long series of powerful novels from his pen. Perhaps the most notable of his stories are *The Trumpet Major*, *The Mayor of Casterbridge*, *Tess of the D'Urbervilles*, and *Jude the Obscure*. In 1908 he completed a dramatic poem entitled *The Dynasts*, whose central figure is Napoleon.

Hargreaves, James (1720–1778), was a poor Lancashire-born mechanic who invented the spinning jenny, one of the revolutionising labour-saving contrivances of the latter half of the 18th century. It met with much opposition, however, and kept him poor, though the community afterwards reaped the advantage in a greatly improved industry.

Harkness, Edward Stephen, B.A., M.A., LL.D. (1874–1940) was a banker and one of America's greatest philanthropists. Donor of the Pilgrim's Prize of £2,000,000 to Great Britain; founded in 1930 the Pilgrim Trust in appreciation of Great Britain's acceptance of financial burdens in the Great War of 1914–18.

Harley, Robert, 1st Earl of Oxford, K.G., P.C. (1661–1724), a distinguished Tory statesman—originally, however, a Whig—of the Queen Anne period, who fell into disgrace after that Sovereign's death in consequence of being suspected of intriguing with the Stuarts. He served at different times as Speaker of the House of Commons, Chancellor of the Exchequer, and Lord Treasurer. "The Harleian Collection" in the British Museum is a reminder of his cultured literary tastes.

Harold II. (1022–1066), the last of the Saxon Sovereigns of England, and the son of Ear Godwin, was crowned King in succession t Edward the Confessor in 1066. The coming o William the Conqueror, with his great army soon, however, put an end to the hopes o Harold and his followers; and the Battle o Hastings terminated at once his life and Saxo sway in this country.

Haroun-Al-Raschid (763–809), the famous Calip of Bagdad, familiar to all by the reference to him in the *Arabian Nights*.

Harriman, William Averell (b. 1891), America public official; under-secretary of state fo political affairs, 1963; Pres. Kennedy's rovin ambassador, 1961; special U.S. representativ in Europe for Marshall Aid, 1948–52.

Harris, Joel Chandler (1848–1908), America journalist and author, famous as the creator o "Uncle Remus." The negro humour of hi stories brought him world-wide popularit among adults and children alike. His Bre Rabbit in the Uncle Remus negro folk-tales wa the forerunner of Mickey Mouse, impudentl victorious in every contest against fearfu adversaries.

Harrison, Frederic (1831–1923), as leader of th English Positivists, filled a prominent part i philosophical discussions during the last quarte of the 19th century. In 1907 he published *Th Creed of a Layman* and *The Philosophy o Common Sense*, and in 1908 *Realities and Ideals*

Harrison, John (1693–1776), the inventor of th chronometer, for which he received the Government grant of £20,000, was a mechanician o great ingenuity, who effected many importan improvements in clocks, watches, and othe instruments. In 1715 he made an 8-day cloc with wooden wheels, which is still working i the Science Museum, South Kensington.

Harte, Francis Bret (1839–1902), the America poet and author, who leapt into popularity i the late 'sixties by his clever sketches an stories of Californian mining life.

Harty, Sir (Herbert) Hamilton, Mus. Doc. (1880-1941), was a well-known British composer an conductor. Conductor of Hallé Orchestra 1920-33; Musical Adviser and Conductor-in-Chief o London Symphony Orchestra 1932–41.

Harvey, William (1578–1657), an English physicia who rose to great eminence both as anatomis and physiologist. He spent five years a Padua where Galileo was a teacher at th University. He immortalised himself by discovering the circulation of the blood in 1616. H was physician to both James I and Charles I

Hastings, Sir Patrick, Q.C. (1880–1952), lawyer politician, and playwright. Attorney-Genera in first Labour Government, 1924. Author o *The Blind Goddess*.

Hastings, Warren (1732–1818), the first Governor General of India. On his return to Englan 12 years later he was impeached on charges o excessive cruelty and corruption. The tria lasted seven years, and cost Hastings £76,000 He was ultimately acquitted, and the Eas India Company settled an annuity of £4,00 upon him, and he lived to see his plans for th security of British rule in the Orient publicl applauded.

Hauptmann, Gerhart (1862–1946), one of the leading dramatic poets of Europe. Born in Silesia he devoted himself first to agriculture, the to art, and subsequently to the drama, an lived in Rome, Berlin, Switzerland, and th United States. Produced many plays, including *The Weavers*. Winner of the Nobe Prize for Literature, 1912.

Havelock, Major-Gen. Sir Henry, K.C.B. (1795-1857), one of the heroes of the Indian Mutiny who led the troops to the relief of Cawnpor and Lucknow.

Hawke, Edward, 1st Baron, K.C.B. (1705–1781) one of the great admirals of the 18th century He won a brilliant victory over the French flee at Quiberon in 1759 in a tremendous storm.

Hawkins, Sir John (1532–1595), a brilliant nava officer of the Elizabethan period, who did much sea fighting in many climes, and served as vice admiral in the expedition against the Spanish Armada, for which he was knighted.

Hawthorne, Nathaniel (1804–1864), America novelist, author of *The Scarlet Letter* and *Th Blithedale Romance*.

Haydn, Franz Joseph (1732–1809), Austrian composer, who belongs to the great classical period of Bach, Handel, and Mozart and whose style also influenced Beethoven. He has been given the title "father of the symphony." Much of his life was spent as musical director to the princely Hungarian house of Esterhazy. In 1791 and again in 1794 he visited London, where he conducted his Salomon symphonies. He composed many operatic works, string quartets, symphonies (104 in all), sonatas, songs, Masses, and chamber music. His two great oratorios, *The Oreation* and *The Seasons*, were written in his old age. *See* Section E.

Hazlitt, William (1778–1830), English essayist and critic. His *Characters of Shakespeare's Plays* and his published lectures on the poets and dramatists, besides his *Table Talks*, are still widely read. His son William (1811–1893) was also of literary tastes, though he became Senior Registrar in the Bankruptcy Court; and the son of the latter, William Carew Hazlitt (1834–1913), though originally a civil engineer, acquired celebrity as a bibliographer and numismatist.

Hearst, William Randolph (1863–1951), American newspaper proprietor who established his supremacy in sensational journalism, and built up the biggest newspaper empire in the world.

Heath, Rt. Hon. Edward Richard George, M.P. (b. 1916), Leader of the Conservative Party, 1965–; began his political career in 1950 when he entered Parliament as member for Bexley.

Hedin, Dr. Sven Anders, Hon. K.C.I.E. (1865–1952), a Swedish traveller who made discoveries in Central Asia, and wrote extensively thereon.

Heenan, His Eminence Cardinal John Carmel (b. 1905), Archbishop of Westminster (1963); member of Sacred College (1965).

Hegel, Georg Wilhelm Friedrich (1770–1831), a famous German philosopher and professor who taught that truth or reality has three aspects revealing itself in dialectical development (thesis, antithesis, synthesis) and identified reality with rationalism. Among his important works are *The Phenomenology of the Spirit*, *The Science of Logic*, *Philosophy of Right*. *See also* Dialectical Materialism, J12.

Heidenstam, Carl Gustaf Werner von (1859–1940), Swedish author and one of the most brilliant and outstanding figures in Swedish literature. Received Nobel Prize for Literature, 1916.

Heifetez, Jascha (b. 1901), Russian-born violinist who became a naturalised American. He was the first musician to win a reputation in England by gramophone records before his first personal appearance there.

Heine, Heinrich (*c.* 1797–1856), the German lyric poet, who lived for the best part of his life in Paris, and produced from time to time poems of profound beauty and subtlety of thought. Cynical, satirical, and often bitter, many of his writings excited great conflict of opinion.

Helmholtz, Hermann Ludwig Ferdinand von (1821–94), German physiologist, physicist, and mathematician who made many important contributions to the knowledge of thermodynamics, electrodynamics, and optics. His pupil Heinrich Hertz discovered electromagnetic radiation.

elmont, Jan Baptista van (1577–1644), Belgian chemist who devoted himself to the study of gases. His chief work is *Ortus medicinae* (1648).

éloïse (*c.* 1101–64), niece of Canon Fulbert of Notre Dame. Famed for her romantic attachment to Abelard. (*See* Abelard.)

emingway, Ernest (1899–1961), American author of some celebrated novels: *A Farewell to Arms*, *Death in the Afternoon*, *For Whom the Bell Tolls*, *The Snows of Kilimanjaro*, *The Old Man of the Sea*. He suffered from persecution mania in his last days and committed suicide. Considered one of the most influential writers of his generation. Nobel Prize 1954.

enderson, Rt. Hon. Arthur (1863–1935), President of World Disarmament Conference, 1932–35; Leader of the Labour Party, 1931–32; Foreign Secretary, 1929–31; Home Secretary, 1924. Awarded the 1934 Nobel Peace Prize.

enrietta Maria (1609–1669), the daughter of Henry IV. of France and wife of Charles I.

enry, Joseph (1797–1875), American physicist who invented and operated the first electromagnetic telegraph. The unit of inductance is named after him.

Henry I. (1068–1135), king of England, 1100–35; youngest son of William the Conqueror, ascended the throne during the absence on crusade of his elder brother Robert of Normandy. His long reign brought order and progress, not entirely destroyed by the anarchy under his successor Stephen.

Henry II. (1133–1189), first Angevin king of England, 1154–89, son of Matilda, daughter of Henry I, and her second husband, Geoffrey Plantagenet, count of Anjou; his lands stretched from the Solway Firth to the Pyrenees. He was a strong ruler to whom we owe the establishment of the Common law system (see D4(1)) and many permanent administrative reforms. His conflict with the Church brought about the murder of his archbishop Becket, a man of equally resolute character.

Henry III. (1207–1272), king of England, 1216–72; at war with his barons for the greater part of his reign; incurred unpopularity by his patronage of French favourites. Though an inept ruler his reign showed progress in many fields.

Henry IV. (1367–1413), king of England, 1399–1413, son of John of Gaunt, grandson of Edward III; called Henry Bolingbroke, first of the Lancastrian kings. He was a lover of music and poetry.

Henry IV. of France (Henry of Navarre) (1553–1610), prior to becoming king was the leader of the French Huguenots, and although going over to the Catholics on being crowned, remained in sympathy with the Protestants and protected them by the famous Edict of Nantes. Ravaillac, a religious fanatic, assassinated Henry.

Henry V. (1387–1422), king of England, 1413–22, succeeded his father Henry IV; distinguished himself in the wars with France, his victory at Agincourt (25 Oct. 1415) being his greatest triumph. Though masterful and hard, he was devout and just and made an able and energetic monarch.

Henry VI. (1421–1471), king of England, 1422–61, only son of Henry V., by nature gentle and retiring. Succeeding to the throne under a protectorship as a baby nine months old, he had a troubled reign, including a long war with France and loss of French possessions, the Jack Cade insurrection, and the beginning of the Wars of the Roses, which led to his deposition and the enthronement of Edward IV by the triumphant Yorkists. He was imprisoned in the Tower and there probably murdered. Founded Eton College (1440) and King's College, Cambridge (1441).

Henry VII. (1457–1509), the first of the Tudor line, reigned 1485–1509; succeeded Richard III, after defeating and killing him on Bosworth Field. Conspiracies and rebellions marked his reign, but he reasserted the power of the state over feudal indiscipline.

Henry VIII. (1491–1547), king of England, 1509–47, ascended the throne at the age of 18, a prince of the Renaissance, handsome, skilled in music and sports, with a love of the sea and a deep interest in theology. His marriages, the judicial murders, his quarrel with Rome and the rejection of papal supremacy, the suppression of the monasteries, the rise and fall of Wolsey, the last of England's great ecclesiastical statesmen, made his reign one of the most crucial in history. He built the royal dockyards at Woolwich and Deptford, founded Trinity House, and was the first English monarch to have a navy.

Henry "the Navigator" (1395–1460), a Portuguese Prince, son of John I. He discovered Madeira and the Azores, and was the chief instrument of the national impetus for navigation.

Henschel, Sir George, Mus.D. (1850–1934), English baritone singer, composer and conductor; born in Breslau, he became a naturalised Englishman in 1890. Founder and part conductor of London Symphony Concerts, 1886.

Hepplewhite, George (d. 1786). One of the four great English 18th-century cabinet-makers. He was a contemporary of Chippendale, Robert Adam and Sheraton. His name is identified with the style of furniture which followed the Chippendale period.

Heraclitus of Ephesus (*c.* 540–475 B.C.), a Greek philosopher. His discovery of a *changing* world (he lived in an age of social revolution when the ancient Greek tribal aristocracy was beginning to give way to democracy) influenced the philosophies of Parmenides, Democritus, Plato, and Aristotle.

Herbert, George (1593–1633), the most purely devotional of English poets.

Hereward the Wake, the last of the Saxon nobles to hold out against the Normans. Taking refuge in the Fen country, he long defied the Conqueror's forces, but was at last betrayed into the enemy's hands by monks. William afterwards honoured him with a place at Court.

Herod the Great (*c.* 73–4 B.C.), the tyrannical king of Judæa who secured the title from Marc Antony in 37 B.C. This was the Herod who was ruling when Christ was born and who ordered the massacre of the Innocents.

Herodotus (*c.* 485–425 B.C.), the great Greek historian, called by Cicero the father of history Has also been called the father of anthropology.

Herrick, Robert (1591–1674), an English lyric poet, unrivalled in his own field. Author of *Gather ye Rose Buds*, *Cherry Ripe*, *Oberon's Feast*, etc.

Herriot, Edouard (1872–1957), French statesman; Pres. of the National Assembly, 1947–54. Mayor of Lyons for more than a generation, three times Prime Minister, the recognised spokesman of the Left-Centre party, which was for so long dominant in French politics.

Herschel, Sir John Frederick William, Bt., F.R.S. (1792–1871), a celebrated astronomer who did much to extend the power of the telescope.

Herschel, Sir William, F.R.S. (1738–1822), great astronomer, father of the last-named, discovered the planet Uranus. His sister, Caroline Lucretia (1750–1848), was the author of *Index to Flamsteed's Observations of the Fixed Stars* and *Errata*.

Hertz, Heinrich (1857–1894), German physicist whose laboratory experiments confirmed Maxwell's electromagnetic theory of waves.

Herzl, Theodor (1860–1904), founded modern political Zionism.

Hesiod (*floruit c.* 735 B.C.), ancient Greek nature poet, author of the poems *Work and Days*, which tells of life in the country.

Hewart, 1st Viscount, P.C. (1870–1943), Lord Chief Justice of England, 1922–40.

Hill, Octavia (1838–1912), a noted pioneer English social reformer who took a practical interest in the housing conditions of the poor, and a pioneer in slum clearance in London. Helped to institute the Charity Organisation Society, and was one of the first women to sit on a Royal Commission.

Hill, Sir Rowland, K.C.B., F.R.S. (1795–1879), the first propounder of the idea of the penny postal system, was secretary to the Postmaster-General from 1846 to 1854, after which he was Chief Secretary to the Post Office until 1864.

Hindemith, Paul (1895–1963), German composer and violinist. Much of his work is *Gebrauchsmusik* (workaday music written with the aim of establishing closer contact between composer and public). His works are numerous and strikingly varied, and include sonatas and chamber works, songs, operas, ballet music, symphonies, and the oratorio *Das Unaufhörliche.* Formerly Prof. of Music, Yale, and Zurich.

Hindenburg, Field-Marshal Paul von (1847–1934). President of the German Reich, 1925–34; Chief of the General Staff, 1916–18.

Hinshelwood, Sir Cyril Norman, O.M., F.R.S. (b. 1897), Pres. of the Royal Society and Dr. Lee's Prof. of Chemistry, Univ. of Oxford, 1937–. Shared with Prof. Semenov of Russia the 1956 Nobel Prize for Chemistry for researches into the mechanism of chemical reactions.

Hinton, Christopher, Baron, K.B.E., M.A., D.Eng., D.Sc(Eng.), F.R.S. (b. 1901), as Man. Dir. of the Industrial Group of the U.K. Atomic Energy Authority played important part in the building of Calder Hall. Chairman (1957–64) Central Electricity Generating Board (which owns and operates Britain's nuclear power stations); Member Transport Advisory Council (Min. of Transport) and special adviser on co-ordination of transport, 1965–.

Hippocrates of Chios (fl. *c.* 430 B.C.), a Greek business-man who specialised in mathematics and was the first to compile a work on the elements of geometry.

Hippocrates of Cos (*c.* 460–*c.* 370 B.C.), Greek physician, the father of medicine, b. on the island of Cos off the coast of Asia Minor. He established medical schools in Athens and elsewhere and separated medicine from superstition and so placed it on a scientific basis.

Hirohito, Emperor of Japan (b. 1901), acceded to the throne Dec. 1926.

Hitler, Adolf (1889–1945), German dictator, founder of National Socialism, b. in Austria, son of customs official. Worked in Vienna as artisan; already held anti-semitic views. Came to Munich in 1912; enlisted in Bavarian Infantry at outbreak of first world war. At the end of the war conditions in Germany favoured the growth of a fascist movement and under his leadership the National Socialist (Nazi) Party climbed to power. Appointed Reich Chancellor, 1933. On death of Hindenburg in 1934 became Führer. Commander-in-Chief Wehrmacht, 1935. Under the Hitler regime working class movements were ruthlessly destroyed; all opponents—communists, socialists, Jews—were persecuted and murdered. By terrorism and propaganda the German state was welded into a powerful machine for aggression. There followed the occupation of the Rhineland (1936), the annexation of Austria and Czechoslovakia (1938–39), the invasion of Poland and declaration of war by Great Britain and France (1939), the invasion of Soviet Russia (1941). Final defeat came in 1945 and on April 30 Hitler committed suicide in the Chancellery as the Russians closed in on Berlin.

Hobbes, Thomas (1588–1679), English philosopher who published his most famous work, *Leviathan*, in 1651. He favoured strong Government and therefore supported the supremacy of the State even in religion, but his arguments aroused great antagonism even among the Royalists. He was a child of his age in his enthusiasm for scientific enquiry, and his works provoked fresh thought.

Hobbs, Sir John Berry (" Jack ") (1882–1963), first played for Surrey 1905; retired from first-class cricket Feb. 1935. Scored 61,221 runs including 197 centuries.

Hobhouse, Leonard Trelawney (1864–1929), English sociologist; Prof. of Sociology, London Univ., 1907–29; editor of the *Sociological Review*, 1908–10, and writer for the *Manchester Guardian*, 1897–1902. His books include *The Theory of Knowledge*, *Morals in Evolution*, and *Development and Purpose.*

Ho Chi-minh (b. 1892), leader of the Vietnam revolutionary nationalist party of Indo-China. Successfully led the struggle for independence during and after the second world war. President of North Vietnam.

Hodgkin, Dorothy Crowfoot, O.M. (b. 1910), Wolfson Research Professor of the Royal Society at Oxford since 1960; the third woman to receive the Nobel Prize for Chemistry, awarded in 1964 for her X-ray analysis to elucidate the structure of complex molecules, notably penicillin and vitamin B-12.

Hogarth, William (1697–1764), the celebrated engraver and painter who satirised the follies of his time in a series of engravings instinct with character, humour and power. His *Harlot's Progress*, of six engravings, was published in 1734, and gained him immediate fame. In 1735 he produced his equally celebrated *Rake's Progress*, a series of eight engravings. These were followed by *Marriage à la Mode*, *Industry and Idleness*, and *The March to Finchley.*

Hogben, Lancelot, M.A., D.Sc., F.R.S. (b. 1895), physiologist; Prof. Medical Statistics, 1947–61, Prof. of Zoology, 1941–47, Birmingham Univ.; Prof. Natural History, Univ. of Aberdeen, 1937–41; Prof. Social Biology in London Univ., 1930–37. Author of the great popular works *Mathematics for the Million*, *Science for the Citizen*, and *Mathematics in the Making.*

Hogg, Quintin (1845–1903), was an educationist and philanthropist who, purchasing the old Polytechnic Institution in 1882, turned it into a popular college, providing instruction in every department of education at moderate rates.

Hokusai, Katsushika (1760–1849), Japanese artist of the Ukiyo-e (popular school), whose work is highly original and of singular beauty and delicacy. He excelled in landscapes.

Holbein, The Elder (*c.* 1460–1524), a famous German painter, father of Hans Holbein.

Holbein, Hans—The Younger (1497–1543), was born at Augsburg, and settled in London in 1530, where he won the favour of Henry VIII.

olden, Charles, F.R.I.B.A. (1875–1960), British architect, designer of modern public buildings, including British Medical Asscn. Building, Strand, London Underground Railway Head Offices, Piccadilly Circus, University of London buildings (Senate House), Bloomsbury.

olden, Sir Isaac, Bt. (1807–1897), an inventor and manufacturer who achieved fame and fortune in connection with wool-combing inventions.

ölderlin, Johann Christian Friedrich (1770–1843), friend of Hegel and contemporary of Goethe and Schiller, now considered among the very greatest of German poets. His mind became unhinged in his middle years.

olford, William Graham, Baron, M.A., F.R.I.B.A. (b. 1907), British architect and town-planner. Prof. of Civic Design, Univ. of Liverpool, 1936–47; Prof. of Town Planning, London Univ., 1949–; planned post-war redevelopment of City of London, including precincts of St. Paul's Cathedral; architect of proposed Piccadilly Circus rebuilding scheme; Member Transport Advisory Council, 1965–.

olmes, Oliver Wendell (1809–1894), an American doctor and author of great humour and geniality. His writings include *Autocrat of the Breakfast Table*, *The Professor at the Breakfast Table* and *The Poet at the Breakfast Table*.

olst, Gustav Theodore (1874–1934), a British composer of Swedish descent whose compositions include *The Planets* suite, *The Hymn of Jesus*, an opera *The Perfect Fool*, and a choral symphony. His long career as a teacher of outstanding gifts included the appointment of musical director at St. Paul's Girls' School, London (1905–34) and at Morley College (1907–24). *See* Section E.

olt, Rt. Hon. Harold Edward (b. 1908), Australian politician; succeeded Sir Robert Menzies as Prime Minister and leader of the Liberal Party in January 1966.

olyoake, George Jacob (1817–1906), an eminent secularist lecturer and author, who was identified with many popular movements, expecially Co-operation, of which he was the historian.

olyoake, Rt. Hon. Keith Jacka (b. 1904), New Zealand politician and farmer; Prime Minister since 1957.

omer (c. 700 B.C.), the most famous of all epic poets. Is supposed to have been a Greek who lived probably at Chios or Smyrna, and has generally been regarded as the author of the *Iliad* and the *Odyssey*, though tradition rather than ascertained fact connects his name with those great poems. *See* H3.

ood, Samuel, 1st Viscount Hood of Whitley, G.C.B. (1724–1816), a successful British admiral, who in 1793 was in command of the Mediterranean fleet, and showed great capacity in that post, taking and occupying Toulon, and capturing Corsica among other exploits.

ood, Thomas (1799–1845), an English poet, who, as a prolific writer of serious as well as humorous poems, stands in his own line unique. Of his serious verse, *The Song of the Shirt*, *The Dream of Eugene Aram* and *The Bridge of Sighs* may be cited as the best examples, while his comic poems, notably those of the punning order, are unequalled.

ooke, Robert (1635–1703), English physicist, a great experimenter and inventor. He was also an architect and drew up a plan for rebuilding London after the Great Fire.

ooker, Richard (1554–1600), Master of the Temple from 1585–91, and afterwards Rector of Boscome. Famed for his book on *Ecclesiastical Polity*, and for his exquisite choice of words, was known as "Judicious Hooker."

opkins, Sir Frederick Gowland, O.M., F.R.S. (1861–1947), an eminent English bio-chemist, noted for his important work on proteins and vitamins. In 1929 was awarded the Nobel Prize in Medicine for his discovery of Vitamin D. Pres. of the Royal Society 1931–36, and of the British Association, 1933.

opkins, Harry (1890–1946). Franklin Roosevelt's personal assistant. Particularly assisted the President at the important war-time foreign conferences, as his personal representative abroad, in working out the New Deal, and in the administration of Lend-Lease.

opkinson, John, D.Sc., F.R.S. (1849–98), English engineer and physicist. Senior Wrangler and Fellow at Cambridge. Studied engineering in his father's works, and set up as a consultative engineer. Specialised in electrical work, and by developing the theory of alternating current and of the magnetic current in dynamos he paved the way to the common use of electricity in daily life. Was Professor of Electrical Engineering at King's College, London, 1890–98.

Hoppner, John, R.A. (1758–1810), English portrait painter born in Whitechapel of German parents; studied at the Academy Schools, winning great distinction and painted portraits of many members of the Royal Family.

Horace, or more properly Flaccus Quintus Horatius (65–8 B.C.), the famous Roman satirist and poet, who was the friend of Virgil, and attained immortal fame by his *Satires*, *Epodes*, and *Odes*.

Horner, Arthur (b. 1894), general secretary of the National Union of Mineworkers 1946–59 and a leading British Communist.

Horniman, Annie Elizabeth Fredericka, C.H. (1830–1937). English theatre manager and founder of the repertory system in England. She was the daughter of F. J. Horniman, the traveller and collector, who founded the Horniman Museum in Forest Hill and presented it to the L.C.C. in 1901.

Houdini, Harry (1874–1926), American magician, son of a Hungarian rabbi, world-famed for his escapes from handcuffs, locked chambers, sealed cases under water, etc. His real name was Erich Weiss, and he took his stage name from the French conjuror Houdin. He was a keen student of psychic phenomena and exposed fraudulent mediums.

Housman, Laurence (1865–1959), English playwright, poet, and novelist, younger brother of **Alfred Edward** (1859–1936) also a poet of distinction, a professor of Latin at Cambridge and an eminent classical scholar, author of *A Shropshire Lad*.

Howard, John (1726–1790), earned celebrity for his philanthropic efforts on behalf of prison reform, the pursuit of which eventually exposed him to a fatal fever attack in Russia.

Howard of Effingham, Lord (1536–1624), commander of the fleet which defeated the Spanish Armada, 1588, and took part in the capture of Cadiz, 1596.

Howe, Elias (1819–1867), an ingenious American who was the inventor of the first sewing machine, by which he made a great fortune.

Howe, Julia Ward (1819–1910), American philanthropist and poetess, famous as the authoress of the *Battle Hymn of the Republic* (1861), a leader of the American Suffragette movement, and the first woman to be elected to the American Academy of Arts and Letters.

Howe, Richard, 1st (and last) Earl (of first creation), K.G. (1726–1799), the British admiral who in 1758 destroyed Cherbourg and in 1794 won the famous victory over the French off Brest.

Howells, William Dean (1837–1920), American critic and novelist.

Hubble, Edwin Powell, B.Sc., Ph.D. (1889–1953), U.S. astronomer at Mount Wilson Observatory from 1919 until his death. Noted for his work on extragalactic nebulæ and with the aid of the 200-in. telescope at Mount Palomar made important discoveries.

Hudson, Henry (c. 1550–1611), was a famous English navigator who discovered the Hudson River, Hudson Strait and Bay, and his two books describing his voyages are of the greatest interest.

Hudson, William Henry (1841–1922), English author and naturalist, who spent his early years in South America, memories of which influenced much of his work. His books include *The Purple Land* (1885), *Green Mansions* (1904), *Afoot in England* (1909) and *British Birds* (1895). The Hyde Park Bird Sanctuary (opened in 1925) was established in his memory, and contains the famous figure of *Rima* by Epstein.

Huggins, Sir William, O.M., K.C.B., F.R.S. (1824–1910), British astronomer who pioneered in spectroscopic photography. Collaborated with his wife, **Margaret Lindsay Murray** (1848–1915), who was also an able astronomer.

Hughes, Thomas (1822–1896), educated at Rugby and at Oxford; practised at the Bar, and became a County Court Judge in 1882. His best-known work is *Tom Brown's Schooldays*.

Hugo, Victor Marie (1802–1885), the great poet, dramatist and novelist who headed the Romantic movement in France in the early part of the 19th century. He was a man of abounding energy and creative ability. His dramas include *Hernani*, *Ruy Blas*, and *Le Roi s'amuse*. Of his novels, *Notre Dame* belongs to his early period, *Les Misérables*, to his later life, written while he was living in exile in Guernsey. Less well known is his astonishing skill as a graphic artist, evident even in his boyhood.

Hull, Field Marshal Sir Richard Amyatt, K.C.B., D.S.O., B.A. (b. 1907), British Army cavalry officer, succeeded Sir Francis Festing as C.I.G.S. in 1961, and Lord Mountbatten as Chief of the Defence Staff in 1965.

Humboldt, Baron Friedrich Heinrich Alexander von (1769–1859), German naturalist and explorer whose researches are recorded in his two great books *Voyage de Humboldt et Bonpland* (23 vols., 1805–34) and *Cosmos* (5 vols., 1845–62).

Hume, David (1711–1776), the celebrated historian and philosopher whose *History of England* long held chief place in English historical literature. But Hume's enduring fame rests upon his philosophical writings. He developed the empiricism of Locke into the scepticism inherent in it. His main works are *Treatise of Human Nature* and *Dialogues Concerning Natural Religion*.

Hunt, Brig. (Henry Cecil) John, Baron, C.B.E., D.S.O. (b. 1910), leader of the successful 1953 British Everest Expedition, and director of the Duke of Edinburgh's Award Scheme for Youth. Life peerage conferred, 1966.

Hunt, (James Henry) Leigh (1784–1859), an English poet, politician and essayist. In 1813 he was fined £500, and sentenced to two years' imprisonment for libelling the Prince Regent, and while in prison wrote his poem, *The Story of Rimini*, and other works. In later life he was a constant contributor to literature and from 1847 enjoyed a pension of £200 a year from the Civil List.

Hunt, Wm. Holman, O.M. (1827–1910), one of the three founders of the Pre-Raphaelite movement, and an artist who achieved distinction by several remarkable paintings, the chief of which is, perhaps, *The Light of the World*, an allegorical work.

Hunter, the brothers William, F.R.S. (1718–83) and **John**, F.R.S. (1728–93), were both famous Scottish physicians. William had remarkable success as a lecturer and obstetrician. His valuable anatomical collection was bequeathed to the Univ. of Glasgow. John showed real genius for anatomy, became one of the greatest surgeons of his day and made many discoveries. His surgical museum forms part of the Museum of the Royal College of Surgeons.

Huss, or Hus, John (1369–1415), the Bohemian religious reformer, was strongly influenced by Wyclif and himself urged reform both of abuses in the church and of doctrine. Sentenced to death or recantation he suffered martyrdom on July 6, 1415. His death caused a civil war which lasted for many years.

Hussein ibn Talal (b. 1934), grandson of King Abdullah, succeeded his father Talal as King of Jordan, Aug. 11, 1952.

Hutton, James, M.D. (1726–97), an Edinburgh doctor whose geological researches established the fundamental principles of modern geology. Before his time geology did not exist as a science, all was speculation. He drew his evidence from the rocks themselves, and his *Theory of the Earth* is one of the great classics of science.

Huxley, Aldous (Leonard), C.L. (1894–1963), noted modern writer, grandson of T. H. Huxley and brother of Julian; author of *Crome Yellow*, *Jesting Pilate*, *Brave New World*, *Point Counter Point*, *Ends and Means*, *Grey Eminence*, *The Perennial Philosophy*, etc.

Huxley, Sir Julian Sorrell, M.A., F.R.S. (b. 1887), biologist and writer, grandson of T. H. Huxley. Director-General of Unesco, 1946–48. Secy. of Zoological Soc. of London 1935–42.

Huxley, Thomas Henry, F.R.S. (1825–1895), an eminent scientist and author of numerous works covering a great range of research. After the publication of Darwin's *Origin of Species*, Huxley became an ardent evolutionist. His biological work, *Man's Place in Nature*, and his numerous essays were marked by great vigour and clearness of thought, and gave him a leading position. He held numerous important appointments was President of the Royal Society in 1883, and belonged to many learned societies.

Hyde, Dr, Douglas (1860–1949), the distinguished Irish scholar, historian, poet and folk-lorist. President of Eire, 1938–45.

Hypatia of Alexandria, the only woman mathematician of antiquity. She excited the enmity of Christian fanatics, who raised an agitation against her, and she was put to death in A.D. 415.

I

Ibáñez, Vicente Blasco. (*See* Blasco-Ibáñez.)

Ibrahim Pasha (1789–1848), an able Egyptian statesman, general, and Viceroy, who, adopted by Mohammed Ali as his son, contributed largely to the success of Egyptian policy during the quarter of a century or more of his influence. His conquest of Syria was a notable feat of generalship. He died a few months after being appointed Viceroy.

Ibsen, Henrik Johan (1828–1906), the Norwegian playwright and poet, moralist, and humanist, whose plays, though arousing considerable opposition at the time, are acknowledged as the work of one of the world's greatest dramatists. A master of technique, charging every detail with significance, fusing the comic with the tragic, Ibsen revolutionised the European theatre. His chief works are *Ghosts*, *The Master Builder*, *The Wild Duck*, *A Doll's House*, *Hedda Gabler* and the poetic drama *Peer Gynt*.

Inge, Very Rev. William Ralph, K.C.V.O., D.D. (1860–1954), English divine; Dean of St. Paul's, 1911–34; Assistant Master at Eton, 1884–88; Lady Margaret Prof. Camb., 1907–11. Earned the sobriquet "the gloomy Dean" for his incisive and somewhat pessimistic comments on contemporary affairs.

Ingersoll, Robert Green (1833–99), American lawyer, writer, and lecturer, became known by reason of his lectures directed principally against Christianity.

Ingres, Jean Auguste Dominique (1780–1867), a great French historical painter who was elected to the Institute in 1824, and at his death was a Senator of France.

Innocent III. (1160–1216), Pope from 1198, successfully asserted the power of the papacy over such secular princes as the emperor, Philip II. of France, and John of England. He promoted the 4th Crusade, initiated the crusade against the Albigensian heretics, and held the 4th Lateran Council. His pontificate marks the zenith of the medieval papacy.

Inönü, General Ismet (b. 1884), Prime Min. of Turkey; leader of the Republican People's Party founded by Kemal Atatürk whom he succeeded as Pres., 1938–50, after serving as Prime Min. from 1923 to Atatürk's death in 1938.

Iqbal, Dr. Sir Muhammad (1875–1938), poet-philosopher of the East, b. Sialkot, W. Pakistan, acknowledged as a great authority in the world of literature, both in prose and poetry. He wrote in Urdu, Persian, and English.

Ireland, John (1879–1962), English composer, best known for his settings of the poems of Thomas Hardy, A. E. Housman, and Masefield's *Sea Fever*. He also wrote chamber music, orchestral work and piano pieces.

Irving, Sir Henry (1838–1905), a great English actor who made his first appearance in London in 1866 and whose first distinct success was as Digby Grant in *Two Roses*. His record at the Lyceum Theatre from 1871 onwards covered a brilliant series of productions, including *The Bells*, his first triumph, *Charles I.*, *Eugene Aram*, and a number of Shakespearean impersonations, in some of which, notably Shylock and Hamlet, Irving gave memorable performances.

Irving, Washington (1783–1859), a writer of charming stories and miscellaneous works which won wide favour on both sides of the Atlantic.

Isabella of Castile (1451–1504), reigned jointly with Ferdinand V., her husband. During their thirty years' sway Spain was united as a single monarchy, and achieved the height of its greatness, the discovery of America, the conquest of Granada, and the expulsion of the Moors from Spain being among the events of her reign.

Ismail Pasha (1830–95), grandson of Mohammed Ali was a man of modern ideas and great public spirit, whose policy rendered Egypt practically ndependent of Turkey, the Sultan confirming him in the position and title of Khedive in 1873. It was his adoption of the idea of the Suez Canal that enabled that work to be successfully carried out. By reckless extravagance he involved himself in difficulties, entailing the sale of his Suez Canal shares to England, the establishment of the dual control of England and France, and his own abdication in 1879, when his son Tewfik succeeded.

aels, Joseph (1824–1911), outstanding Dutch genre painter of the 19th century.

, Hirobumi, Prince (1841–1909), one of the most enlightened statesmen of Japan. The unparalleled social metamorphosis which Japan nderwent in the latter half of the nineteenth century owed much to his guidance and nfluence. Was four times Premier.

n the Great (1440–1505), succeeded in bringing the scattered provinces of Muscovy under one supreme governmental control, and put an end to Tartar rule.

n the Terrible (1530–84), crowned as first Czar of Russia in 1547, was a strong and autocratic ruler. He furthered internal consolidation and Russian eastward expansion and entered nto trading relations with Queen Elizabeth.

J

ks, Lawrence Pearsall (1860–1955), Principal of Manchester College, Oxford, 1915–31, and Professor of Philosophy in that College, 1903–31. Entered ministry in 1887 as assistant to the Rev. Stopford Brooke. Editor of the *Hibbert Journal*, 1902–47, and author of several books of religious studies.

kson, Andrew (1767–1845), American general who was twice President of the United States.

kson, Thomas Jonathan (1824–1863), popularly known as "Stonewall Jackson," was the most brilliant general on the Southern side in the American Civil War. Was accidentally killed at the Battle of Chancellorsville. The term "Stonewall" refers to his dogged resistance at the first Battle of Bull Run.

obs, William Wymark (1863–1943), novelist of quaint and peculiar humour, whose stories and sketches of East End riverside life are inimitable.

quard, Joseph Marie (1752–1834), a French mechanic whose Jacquard loom provided a new and effective method of weaving designs in textile fabrics, and was an invention of the very first rank.

ellons, Lithuanian-Polish dynasty, ruled in Poland 1386–1572.

nes I. (1566–1625), King of England (1603–25) and, as James VI., King of Scotland (1567–1625). He was the son of Mary Stuart and succeeded to the English throne on the death of Elizabeth. Numerous plots were formed against him, including the Gunpowder Plot of 1605. He persecuted the Puritans, granted many monopolies, and saw the Authorised Version of the Bible published. Described by Henry IV of France as "the wisest fool in Christendom."

nes II. (1633–1701) King of England and, as James VII., of Scotland (1685–88), third son of Charles I. As Duke of York he was Lord High Admiral in the Second and Third Dutch Wars, during which New Amsterdam fell to England and was renamed New York. As a Roman Catholic he resigned his office after the Test Act of 1673, was nearly excluded from the succession, and, when he came to the throne in 1685, aroused and united strong opposition by his attempts to obtain better conditions for his co-religionists. The unsuccessful Monmouth Rebellion, the Bloody Assize, the Declaration of Indulgence, and the Seven Bishops' Trial marked a reign which ended in the flight of the King and the Revolution Settlement of 1689.

nes, Henry, O.M. (1843–1916), an Anglo-merican novelist and younger brother of William James. He wrote over 100 tales and short stories (many of them foremost examples of their kind) and was one of the most sensitive critics of his day. For the last thirty years of his life he resided mostly in London. His best-known novels are *The Europeans* (1878), *Daisy Miller* (1878), *The Portrait of a Lady* (1881), *The Bostonians* (1886), *What Maisie Knew* (1897), and *The Wings of the Dove* (1902). Became a British subject 1915.

James, William (1842–1910), the great American psychologist and philosopher, brother of Henry James, the novelist. He became Prof. of Philosophy at Harvard University, 1882, and was the founder of the philosophical system known as pragmatism. His first important work, *Principles of Psychology*, 1890, stamped him as one of the most lucid, penetrating and engaging writers of his day.

Janáček, Leoš (1854–1928), Czech composer, conductor, teacher, and student of folk music, b. in Moravia, son of a village schoolmaster, creator of a national style. He wrote much choral, orchestral, and instrumental music and his best known opera is *Jenufa*. *See* Section **E**.

Jeans, Sir James Hopwood, O.M., F.R.S. (1877–1946), mathematician and astronomer, author of *The Universe Around Us*, *The Mysterious Universe*.

Jefferies, Richard (1848–1887), an English naturalist, who, between 1873 and the time of his death, wrote some of the most beautiful descriptions of natural scenery and the customs and habits of the rural world that we possess. His *Gamekeeper at Home* and *The Life of the Fields* are books of great power and sympathy.

Jefferson, President Thomas (1743–1826), took part in the American Revolution, and drew up the Declaration of Independence. Twice U.S. Pres.

Jeffreys, George, 1st Baron of Wem (1645–1689), Lord Chief Justice of Charles II and Lord Chancellor of James II, won for himself unenviable notoriety by his harsh and cruel judgments at the Bloody Assize. He died in the Tower shortly after the flight of James II. It is now thought that the traditional view of Jeffreys is probably untrue as local records give a rather different picture of an able and conscientious judge.

Jellicoe, Adml. of the Fleet, Earl, G.C.B., O.M., G.C.V.O. (1859–1935), Commander-in-Chief of British Fleet, August 1914 to Nov. 1916; and First Sea Lord, Nov. 1916 to Dec. 1917; Gov.-Gen. of New Zealand, 1920–24.

Jenghiz Khan (1162–1227), the famous Mogul ruler who twice conquered China, and forced the Turks within European confines.

Jenner, Edward, M.D., F.R.S. (1749–1823), an English physican who became celebrated by his discovery of the vaccination system of alleviating smallpox, which has been of such incalculable benefit to mankind. Parliament made him grants amounting to £30,000 which left him still out of pocket.

Jerome, Jerome Klapka (1859–1927), a clever journalist and writer, who made his first success with his humorous book, *Three Men in a Boat*. He founded *The Idler*.

Jerome, St. (340–420), a noted theologian of the 5th century, whose Latin translation of the Scriptures (*The Vulgate*) made him famous. He died at Bethlehem.

Jesus Christ (*c.* 6 B.C.–*c.* A.D. 29), the founder of Christianity and the greatest figure of human history. The main source of information on His life and work is the New Testament. Jesus was born at Bethlehem in Judæa, and was the first-born of His mother Mary. According to Matthew, He was miraculously conceived and Joseph was His foster-father. The family home was at Nazareth in Galilee. Jesus lived at a critical period in Jewish history. His teaching is summarised in the Sermon on the Mount. So far as scholars can tell Jesus was born some six years earlier than the date which Christian tradition has chosen to fix the first year of its era.

Jiménez, Juan Ramón (b. 1881), Spanish lyric poet who was awarded the Nobel Prize for Literature in 1956.

Jinnah, Mohammed Ali (1876–1948), Indian statesman. The emergence of a separate Moslem state of Pakistan when the British left India was mainly due to his efforts. He was for many years the active President of the Moslem League, and in 1947 became the first Gov.-Gen. of Pakistan.

Joachim, Joseph (1831–1907), Hungarian violinist and composer of the classical-romantic school of

Mendelssohn, Schumann, and Brahms. He ranks as the greatest solo violinist the world has ever known.

Joan of Arc, St. (1412–1431), the girl whose heroism inspired the French to drive the English out of Orleans, and enabled Charles to be proclaimed King at Rheims. She was burned as a heretic at Rouen. Canonised at St. Peter's, Rome, 1920.

Joffre, Marshal Joseph Jacques Césaire, G.C.B., Hon. O.M. (1852–1931), Commander-in-Chief of the French Armies 1911–16. With Gen. Gallieni deserves credit for the French counter-attack at the Battle of the Marne. Entered the Army in 1870, and commanded a battery during the siege of Paris.

John XXIII. (1881–1963), elected Pope in 1958 on the death of Pius XII; formerly Cardinal Angelo Giuseppe Roncalli, patriarch of Venice. The Oecumenical Council which opened in Rome in 1962 was one of the great achievements of his short reign. He sought to reform the Church to meet the needs and conditions of the times and set in train movements towards Christian unity. The principal sources of his teaching are the two enlightened encyclicals, *Mater et Magistra* (1961) and *Pacem in Terris* (1963).

John, St., the Baptist (executed A.D. 28), the forerunner of Christ.

John, St., the Evangelist, one of the twelve apostles of Jesus, a Galilean fisherman, son of Zebedee and brother of James, traditionally the author of the fourth Gospel.

John, surnamed "Lackland" (1167–1216), King of England from 1199 to his death at Newark after deposition by the Barons in 1216. One of the most detested of English monarchs, but whose reign stands out large in history because of his having granted, under compulsion, the Magna Carta, England's great bulwark of liberty.

John of Gaunt (1340–1399), Duke of Lancaster, son of Edward III, and father of Henry IV., one of the most powerful English nobles of his day. In Wat Tyler's rebellion his palace in the Savoy was destroyed.

John, Augustus Edwin, O.M., R.A. (1878–1961), outstanding British painter, especially notable for his portraits. Among others, he painted Lloyd George, Bernard Shaw, and T. E. Lawrence. His works in the Tate Gallery include *The Smiling Woman* and *Galway*.

Johnson, Amy, C.B.E. (1903–1941), was the first woman aviator to fly solo from England to Australia, when she made a record flight to India (6 days to Karachi). Lost her life when flying as a pilot of the Air Transport Auxiliary over the Thames Estuary.

Johnson, Lyndon Baines (b. 1908), American politician who as Vice-President automatically became President of the United States on the death by assassination of Kennedy on 22 Nov. 1963. In the 1964 presidential election he won a decisive victory over Senator Goldwater, the Republican candidate. Senator from Texas since 1948. *See also* Section C, Part I.

Johnson, Dr. Samuel (1709–1784), the great lexicographer and writer, who for a number of years was the most prominent literary man in England. His *Dictionary* was published in 1755, before which he had attained eminence by several works including the *Vanity of Human Wishes*. His *Rasselas* appeared in 1759, and for two years he published *The Idler*, a collection of essays after the style of the *Spectator*. His *Lives of the Poets* appeared in 1781. He was greatly honoured during his life, enjoyed a pension of £300 a year from 1762, at his death was buried in Westminster Abbey, and had the best biography in the language written upon him by James Boswell.

In the terrible events which ollowed the outbreak of the Revolution she was ne of the chief sufferers, but bore her fate with ignity and resignation, and met her death on he scaffold with unflinching courage.

rie Louise (1791–1847), daughter of Francis I, f Austria, became wife of Napoleon in 1810, nd bore him a son. (*See* **Napoleon II.**)

rius, Caius (*c.* 155–86 B.C.), the famous Roman eneral of humble birth who became tribune 119 B.C.), praetor (115 B.C.), propraetor in pain (114 B.C.) and was seven times consul. Married an aunt of Julius Caesar.

Mark Antony. (*See* **Antonius, Marcus.**)

Marlborough, John Churchill, 1st Duke of (1650–1722), brilliant soldier, the victor of Blenheim, Ramillies, Oudenarde, and Malplaquet. Married to Queen Anne's favourite, Sarah Jennings.

Marlowe, Christopher (1564–93), one of the greatest of the Elizabethan dramatists. His principal plays are *Dr. Faustus, Tamburlaine the Great, Edward II.*, and *The Jew of Malta.* He was killed in a tavern brawl at Deptford.

Marryat, Captain Frederick (1792–1848), an exceedingly popular writer of sea stories. Author of *Peter Simple, The King's Own, Jacob Faithful,* and *The Children of the New Forest.*

Marshall, General George Catlett (1880–1959), American soldier and statesman; Chief of Staff of U.S. Army, 1939–45. Initiated the American offer of aid to Europe, which led to the European Recovery Programme. Awarded Nobel Peace Prize, 1953.

Martial (Marcus Valerius Martialis) (A.D. *c.* 40–A.D. *c.* 104) was born at Bilbilis in Spain, but spent the greater part of his life in Rome, where he acquired much fame as a poet and epigrammatist.

Marvell, Andrew (1620–78), English poet, satirist and diplomatist, friend of Milton, who was best known for his many prose satires and lampoons.

Marx, Heinrich Karl (1818–83), German philosopher and socialist and lifelong partner and friend of Engels with whom he collaborated in writing many important works on socialism and in developing his theories of dialectical materialism. After being expelled from the continent he settled in London where he wrote his monumental work *Das Kapital.* Communism is based on the teachings of Marx. *See* **Marxism, J27,** *also* **Q14**(2).

Mary I. (1516–58), daughter of Henry VIII. and Catherine of Aragon. Was Queen of England from 1553 to her death. She was a strenuous Roman Catholic, and entirely reversed the religious order of things during her brief reign, persecuting, imprisoning, and burning at the stake many of the Protestant reformers, nearly three hundred persons being put to death as heretics. She married Philip of Spain in 1554.

Mary II, (1662–94), daughter of James II; came to the English throne in 1689, having married her cousin, William of Orange, in 1677. After assenting to the "Declaration of Rights," they reigned jointly until her death.

Mary, H.M. Queen, K.G., K.T., G.C.V.O. (1867–1953), Queen Consort of George V.

Mary, Queen of Scots (1542–87), daughter of James V. of Scotland, married to the Dauphin of France at sixteen years of age. On the death of her husband in 1560 she returned to Scotland, and for a time was the acknowledged Queen of the Scots. In 1565 she married Lord Darnley, who a year later was murdered and Mary married Bothwell. The Scottish nobles rebelled against Mary, and she was made prisoner and confined in Loch Leven Castle, compelled to abandon Bothwell and to sign an Act of Abdication in favour of her son. She escaped to England, sought the protection of Elizabeth, and was imprisoned for nineteen years in various castles, and ultimately beheaded on a charge of conspiracy. She was buried in Peterborough Cathedral but after her son James I. of England ascended the throne her remains were removed to Westminster Abbey.

Masaryk, Jan Garrigue (1886–1948), son of Thomas Masaryk. Served as Czech Minister in London, 1925–38 and as Foreign Secretary, 1940–48.

Masaryk, Thomas Garrigue (1850–1937), Czech philosopher and statesman, one of the greatest fighters for a democratic society; founder and first President of Czechoslovakia, 1918–35.

Mascagni, Pietro (1863–1945), Italian composer, whose brilliant one-act opera *Cavalleria Rusticana* produced in 1890 brought him sudden celebrity. None of his later operas was as successful.

Masefield, John Edward, O.M., C.L. (b. 1878), English poet laureate (since 1930), playwright, and novelist. Most popular among his poems are the *Salt-Water Ballads, Reynard the Fox,* and *Right Royal.*

Maskelyne, John Nevil (1839–1917), famous illusionist who exposed the mysteries of the Davenport spiritualistic quacks.

Mason, Alfred Edward Woodley (1865–1948), an English novelist, author of many popular stories of adventure including *The Four Feathers* and *Fire Over England*.

Massenet, Jules Emile Frédéric (1842–1912), French composer whose melodious compositions include songs, orchestral suites, oratorios, and 23 operas, among them *Manon* and *Thaïs*.

Massine, Léonide (b. 1896), a famous Russian dancer who was for some years Ballet Master at the Roxy Theatre, New York. Among his more famous ballets are *The Good Humoured Ladies, Boutique Fantasque, Pas d'Acier, Les Matelots, Le Beau Danube* and *Les Présages*.

Masters, Edgar Lee (1869–1950), American poet who occupies a permanent place in American literature by the publication in 1915 of his *Silver Spoon Anthology*, a hundred poems relating the real character as opposed to the eulogistic inscriptions on their tombstones of the dead in a typical American township.

Matisse, Henri (1869–1954), French painter, the foremost member of a group known as *les Fauves*. His work is remarkable for its use of pure and brilliant colour and its reliance on colour variations to express form and relief.

Matsys or Metzys, Quintin (1466–1530), a distinguished Flemish painter, who was originally a blacksmith. He excelled in Scriptural subjects.

Maugham, (William) Somerset, C.H., C.L. (1874–1965), British novelist, playwright, and short-story writer. Born in Paris, he qualified as a doctor, but soon abandoned medicine for literature, achieving a great success with his first novel in 1897, *Liza of Lambeth*, a study of slum life. He travelled widely which gave him a deep insight into human nature. As a playwright he has been equally successful. His last work *Points of View* was published in 1958.

Maupassant, Henri René Albert Guy de (1850–93), the famous French author and writer of short stories, was a friend of Flaubert, Zola, and Daudet. He was the greatest of all European short-story writers, standing alone in grace, wit and epigram.

Mauriac, François (b. 1885), French novelist whose works are regarded as among the chief literary productions of to-day. In addition to a long series of novels he has written many critical works and essays. Leader-writer for *Figaro*; Nobel Prizewinner, 1952.

Maurois, André, K.B.E. (b. 1885), French biographer, novelist and essayist who has written lives of Shelley, Disraeli, Byron, Voltaire, Fleming, and Dickens.

Maxim, Sir Hiram Stevens (1840–1916), the inventor of the famous automatic quick-firing gun.

Maxton, James (1885–1946), was a prominent Socialist politician; M.P. for the Bridgeton Divn. of Glasgow, 1926–46. Chairman of I.L.P. 1926–31 and 1934–39.

Maxwell, James Clerk (1831–79), Scottish physicist who wrote his first scientific paper at the age of 15. Was Professor of Natural Philosophy at Aberdeen, 1856, and for eight years held the same post at King's College, London, 1860–68. In 1871 he became the first holder of the new Professorship of Experimental Physics at Cambridge University. His best-known work is his treatise on electricity and magnetism, published in 1873. He made the discovery that founded the electro-magnetic theory of light, and to his electrical researches the advent of wireless is due.

Mazarin, Jules (1602–61), an Italian Cardinal who became chief Minister of State under Louis XIV., and was for a number of years the practical ruler of France. He succeeded Richelieu.

Mazeppa-Koledinsky, Ivan Stepanovich (1644–1709), the hero of Byron's poem, was a real personage, and a Pole, and was tied naked on the back of a wild horse, and so sent out across the Russian desert, for an intrigue with a noble's wife. He was liberated by Cossacks and afterwards attained an honourable position.

Mazzini, Giuseppe (1805–72), an Italian patriot, who, in his endeavours to secure the independence of Italy, incurred the disfavour of the authorities, and was compelled to leave the country. He started a newspaper called *Young Italy* at Marseilles, and in 1837 came to London, and kept up his attacks upon existing governments. In 1848 he was back in Rome and was elected dictator of the Roman Republic. He was not allowed to hold this position long, however, for the French occupied Rome and Mazzini was driven to England again. The unification of Italy was accomplished in other ways than those advocated by Mazzini, but he lived to see Victor Emmanuel King of United Italy.

Medici, the famous Florentine family who combined the career of merchants and bankers with the exercise of political power and patronage of the arts. Cosimo the Elder (1389–1464) was for over thirty years the virtual ruler of Florence. He was wealthy, cultivated, liberal, and a consummate statesman. His illustrious grandson Lorenzo the Magnificent (1449–92), poet, friend of artists and scholars, governed the state in great munificence. His grandson, Lorenzo, was the father of Catherine de' Medici, Queen of France (*q.v.*). Then the family had some reverses until Cosimo (1519–74), one of the most able rulers of the 16th cent., became Duke of Florence and then Grand-Duke of Tuscany which title the Medicis held until 1737.

Méhul, Etienne Nicolas (1763–1817), French operatic composer, *Joseph* being considered his masterpiece. In his early years much influenced by Gluck.

Melanchthon, Philip (1497–1560), German scholar and humanist who assisted Luther and wrote *Loci communes*, the first great Protestant work on the principles of the Reformation.

Melba, Dame Nellie, G.B.E. (1861–1931), the celebrated Australian soprano, b. in Richmond (Victoria), who made her operatic début in Brussels in 1887.

Melbourne, 2nd Viscount (1779–1848), Queen Victoria's first premier, holding office over six years, and identified with many important Liberal measures.

Mendel, Gregor Johann (1822–84), Austrian botanist. After joining the Augustinian order he moved to the monastery at Brünn where he afterwards became Abbot and taught natural history in the school there. His main interest however, was the study of inheritance, and his elaborate observations of the common garden pea resulted in the famous law of heredity which to-day bears his name. His hypothesis was published in 1866 but no attention was given to it until 1900. *See* **Section F, Part II.**

Mendeleyev, Dmitry Ivanovich (1834–1907) Russian chemist who made important contributions to physical chemistry and general chemical theory. First to discover the critical temperatures and formulated the Periodic Law of atomic weights. Element 101 is named after him.

Mendelssohn-Bartholdy, (Jacob Ludwig) Felix (1809–47), German composer, grandson of Moses Mendelssohn, the philosopher. He belongs with Chopin and Schumann to the early 19th century classic-romantic school, and his music has a delightful delicacy and melodic beauty. He was conductor of the famous Gewandhaus concerts at Leipzig for a time and often visited England. Frequently performed are his overtures *A Midsummer Night's Dream* and *The Hebrides* (or *Fingal's Cave*), written in his youth, two oratorios *St. Paul* and *Elijah*, the violin concerto in E minor, the piano work *Variations Sérieuses* and *Songs without Words* and the *Scotch* and *Italian* symphonies. The name Bartholdy was added to the surname when his father abandoned Jewry. *See* **Section E.**

Mendès-France, Pierre, LL.D. (b. 1907), French statesman. His skilful diplomacy and energy helped to solve the many problems that faced his country when he took office as Prime Minister in June 1954. His government was overthrown on his Algerian policy in Feb. 1955 Leader of the Radical Party minority which did not support the de Gaulle constitution.

Menuhin, Yehudi (b. 1916), violin virtuoso, one of the greatest musical prodigies of the 20th century. Born in New York of Jewish parentage; made his first London appearance in the San Francisco Orchestra, 1929.

Menzies, Rt. Hon. Sir Robert Gordon, K.T., C.H. Q.C. (b. 1894), Australian Liberal leader; Prime Minister, 1939–41, 1949–66. Lord Warden of the Cinque Ports, 1966.

Mercator, Gerhardus (1512–94), the Flemish geographer who invented a celestial and a terrestrial globe, by which he introduced his famous projection, in which meridians and parallels of latitude cross each other at right angles, both being indicated by straight lines. This greatly simplified navigation.

eredith, George, O.M. (1828–1909), novelist and poet, "the Grand old Man of English letters." His works are rich in imagery, poetry, wit, and characterisation, and as a delineator of womanhood he is unsurpassed. Among his great novels are *Ordeal of Richard Feverel*, *Evan Harrington*, *Rhoda Fleming*, *The Egoist*, *Diana of the Crossways*, and *The Amazing Marriage*.

esmer, Friedrich Anton (1733–1815), was a German doctor who founded the system of mesmerism or animal magnetism.

estrovic, Ivan (1883–1962), a Dalmatian sculptor, recognised as one of the leading European sculptors of his day. The Tate Gallery and the Victoria and Albert Museum have examples of his work.

etastasio, Pietro (1698–1782), the celebrated Italian librettist who provided texts for such composers as Gluck, Handel, Haydn, and Mozart. He lived in Vienna as court poet and his real name was Pietro Bonaventura Trapassi.

etchnikov, Ilya (1845–1916), an eminent Russian biologist; Nobel Prize for Medicine, 1908.

eyerbeer, Giacomo (1791–1864), was born in Germany, but spent most of his life in Paris, where he produced all his great operas, which include *Robert le Diable*, *Les Huguénots*, and *L'Africaine*.

eynell, Alice (1849–1922), English poet and essayist, wife of Wilfred Meynell (1852–1948), editor of the Catholic paper *Merry England*.

ichelangelo (Michelagniolo Buonarroti) (1475–1564), the renowned Italian painter, sculptor, architect and poet, whose genius was such a power in beautifying the churches of Rome and Florence. Was the last and in some respects the greatest of the Italian sculptors; while his large paintings, particularly *The Last Judgment*, in the Sistine Chapel, are no less famous.

ichelet, Jules (1798–1874), a noted French historian and author.

ichelson, Albert Abraham (1852–1931), American physicist, born in Poland. Designer of an interferometer for estimating the diameters of stars. Collaborated with E. W. Morley in the *Michelson-Morley* experiment to measure the velocity of the earth through the "ether" which led to the conclusion that the ether is non-existent, a finding which had great value for Einstein's theory of relativity. The first American scientist to win the Nobel prize for Physics, 1907, in which year he was also awarded the Copley Medal.

ckiewicz, Adam (1798–1855), greatest Polish poet and revolutionary. Chief works *The Ancestors*, *Pan Tadeusz*.

ll, John Stuart (1806–73), achieved high reputation by his numerous works on philosophical questions. He was an ardent liberal and leader of the utilitarian school of philosophy. Radical M.P. for Westminster, 1865–68, died in Avignon. His chief works are *Principles of Political Economy*, *System of Logic*, *On Liberty*.

llais, Sir John Everett, Bt., P.R.A. (1829–96), was at one time the most prominent of the English Pre-Raphaelites, but soon cast himself free from their mannerisms, and began the production of a long series of famous pictures. Among his numerous works we have room to mention only *The Eve of St. Agnes*, *Autumn Leaves*, *The Order of Release*, *Effie Deans*, *Chill October*, and *Bubbles*.

llet, Jean François (1814–75), one of the greatest of French painters of pastoral subjects; his celebrated work *The Angelus* is universally known by its numerous reproductions.

ilikan, Robert Andrews (1868–1953), American physicist who is world famous for his researches on electrons, and for discovering the cosmic rays. Professor of Physics at Chicago University 1910–21, and Director of the Norman Bridge Laboratory of Physics at Pasadena, California 1921–45. Awarded Nobel Prize for Physics, 1923.

ne, Alan Alexander (1882–1956), English humorist, poet, and playwright who wrote much delightful verse and stories for children.

lner, Alfred, Viscount (1854–1925), imperial statesman, who served in South Africa from 1897 to 1905 and had great influence on the history of that country. Was Secretary for War in 1918 and for the Colonies, 1919–21.

Miltiades (d. 489 B.C.), one of the leaders of the Athenian army against the Persians at Marathon.

Milton, John (1608–74), England's greatest epic poet, whose *Paradise Lost* is the greatest poem of the kind in the language. The best known of his other poems are probably the *Ode on the Morning of Christ's Nativity*, *L'Allegro*, *Il Penseroso*, *Lycidas*, and the sonnet *On his Blindness*. In 1652 he became totally blind, and at his death was buried in St. Giles's Church, Cripplegate, London, a monument being erected to his memory in Westminster Abbey.

Minot, George Richards, M.D. (1885–1950), an eminent American doctor who became Prof. of Medicine at Harvard in 1928, and famous for his researches in the pathology of the blood, and for his discovery of the curative properties of liver in pernicious anæmia. Shared the Nobel Prize for Medicine, 1934.

Mirabeau, Gabriel, Comte de (1749–91), one of the prominent figures of the French Revolution, and a famous orator.

Mistral, Frédéric (1830–1914), French poet who spent his whole life in Provence and wrote many works of great lyrical beauty, founded the Félibrige society (*q.v.* Gen. Inf.); completed *Lou Trésor dóu Félibrige* in 1886, a Provençal dictionary and encyclopædia of Provence. Nobel Literary Prize, 1904.

Mithridates (*circa* 132–63 B.C.), was King of Pontus from 120–63 B.C., and showed great capacity as a commander conquering a great part of Asia Minor and Greece.

Modigliani, Amedeo (1884–1920), Italian painter, b. Livorno, whose portraits and figure studies show a highly individual style. He spent most of his short life in Paris which was one of poverty, illness, and disillusionment.

Moffat, James (1870–1944), Scottish divine who translated the Bible into modern English.

Mohammed (570–632), the founder of Islam, the religion of the Moslems, fled from Mecca to Medina in 622, from which date the Mohammedan era opens. By his constant preaching and proclaiming of the one and only Deity Allah he gathered round him a small and loyal, hard, fighting band of followers and was able to return to Mecca eight years later, an acknowledged conqueror. The Sacred Book of Islam, the *Koran*—though presented by him as an original revelation from the Angel Gabriel—may in the main be traced to Biblical and Rabbinical sources. (*See* **Islam, Section J.**)

Moiseiwitsch, Benno, C.B.E. (1890–1963), Russian-born, naturalised British pianist, especially well known for his rendering of the works of the Romantics.

Molière (Jean Baptiste Poquelin) (1622–73), the greatest of French comic dramatists, who, from being a poor strolling player, became the leading dramatist of his time. His greatest comedies were *Le Tartuffe*, *Le Misanthrope*, *Le Malade imaginaire* and *Le Médecin malgré lui*.

Molotov, Vyacheslav Mikhailovitch (Skryabin) (b. 1890), Russian diplomat; succeeded Litvinov as Commissar for Foreign Affairs, 1939–49. Chief representative of the Soviet Union at numerous post-war conferences. Expelled from Communist Party, 1964.

Moltke, Field-Marshal Count Helmuth von (1800–91), was responsible for the Prussian strategy in the Danish, Austrian, and Franco-Prussian wars, in all of which he was outstandingly successful.

Mond, Ludwig, Ph.D., F.R.S. (1839–1909), German chemist who in 1867 settled in England as an alkali manufacturer and in partnership with John Brunner successfully manufactured soda by the Solvay process.

Monet, Claude (1840–1926), the most representative of the French Impressionists. Exhibited in 1874 his landscape *Impression Soleil levant*, from which the word *Impressionism* was derived.

Monier-Williams, Sir Monier, K.C.I.E., LL.D., Ph.D. (1819–99), a great Sanskrit scholar who laboured with distinction in bringing westward the wisdom of the Orient.

Monk, George, 1st Duke of Albemarle (1608–69), served with distinction as general and admiral, particularly in the Anglo-Dutch wars, and in 1660 effected the Restoration of Charles II.

Monroe, James (1758–1831), Fifth President of the U.S. Was appointed Governor of Virginia in 1799, and in 1803 went to France and carried through the purchase of Louisiana. Best known as the author of the Monroe Doctrine, which he outlined in his Presidential message of 1823.

Montagu, Lady Mary Wortley (1689–1762), the greatest of English woman letter writers. The two volumes of her *Complete Letters* were published in 1965–66. *See also* **P16(1)**.

Montaigne, Michel de (1533–92), a French essayist of world-wide celebrity, who may be regarded as the inventor of the essay form, and had a great influence on English writers.

Montcalm, General Louis Joseph, Marquis de (1712–59), commander of French Army against British in Canada in final struggle for possession. Defeated by Wolfe in 1759 and mortally wounded.

Montesquieu, Charles Louis de Secondat, Baron de La Brède et de (1689–1755), French philosopher and author. His works include *Les Lettres Persanes*, a witty satire on contemporary life, and his great work *L'Esprit des Lois*, setting out his ideas on politics and law. Showed a genius for generalisation and gave to history a philosophy. Greatly admired England and her constitution, which he misunderstood, and his influence on the authors of the American constitution consequently led to the impractical separation of the executive (the President) from the law-making power (Congress).

Montessori, Maria (1869–1952), educationist, whose methods for infant teaching have wide recognition. *See* **J14(2)**.

Monteverdi, Claudio (1567–1643), an Italian composer of importance by reason of his pioneer work in the operatic form. His most important dramatic work was *Orfeo* (1608). *See* **Section E.**

Montezuma II. (1466–1520) was Emperor of Mexico when Cortes invaded that country, and the last Aztec ruler of Mexico.

Montfort, Simon de, Earl of Leicester (1206–65), was a powerful baron, with liberal views, and a hatred of kingly tyranny. It was his bold action that forced Henry III., his brother-in-law, to grant the first English Parliament. He met his death at the Battle of Evesham.

Montgolfier, Joseph Michel (1740–1810) **and Jacques Etienne** (1745–1799), two French brothers who invented the first practical balloon.

Montgomery, Field-Marshal Viscount, K.G., G.C.B., D.S.O. (b. 1887), rose to military fame as Commander of the 8th Army in the North African and Italian campaigns, 1942–44. C.-in-C. British Forces in France and Germany, 1944–46; C.I.G.S., 1946–48. Permanent Military Chairman of the Western Union Defence Committee, 1948–51; Deputy Supreme Allied Commander Europe (NATO), 1951–58. Retired 1958. His *Memoirs* were published in 1958.

Montrose, James Graham, Marquess of (1612–50), brave and inspiring Scottish general who raised the Highland clansmen for Charles I. and again for Charles II. His lyric poetry included *My dear and only love.*

Moody, Dwight Lyman (1837–99), the American revivalist preacher, associated for many years in mission work on both sides of the Atlantic with Ira D. Sankey, the "American Singing Pilgrim."

Moore, George (1852–1933), a well-known Irish novelist; author of *Confessions of a Young Man, Esther Waters, Evelyn Innes*, etc.

Moore, Henry, O.M., C.H. (b. 1898), English sculptor, examples of whose work are to be seen in the Tate Gallery, the V. and A. Museum, and St. Matthew's Church, Northampton.

Moore, Sir John (1761–1809), British general, who trained the infantry for the Spanish Peninsular campaigns and conducted a brilliant retreat to Corunna, where he was mortally wounded after defeating the French under Soult.

Moore, Thomas (1779–1852), Ireland's greatest poet, the author of *Irish Melodies, Lalla Rookh, The Epicurean*, and many other works. He enjoyed immense popularity both in England and Ireland. Friend and biographer of Byron.

More, Sir Thomas (1478–1535), succeeded Wolsey as Lord Chancellor under Henry VIII., but fell into disgrace by refusing to take the oath of Supremacy, and was ultimately executed. His *Utopia* (*see* **J43**) is one of the world's most noted books. Canonised in 1935 along with John Fisher, Bishop of Rochester, who was similarly martyred by Henry VIII.

Morgan, Sir Henry (*c.* 1635–88), Welsh buccaneer of great skill and daring; operated in the Caribbean against the Spaniards, capturing and plundering Panama in 1671. Knighted by Charles II. and made Deputy-governor of Jamaica.

Morgan, John Pierpont (1837–1913), one of the great financiers of his time who built the family fortunes into a vast industrial empire.

Morland, George (1763–1804), a painter of English rural life.

Morley, John, Viscount, O.M. (1838–1923), Liberal statesman and author, served as Secretary for Ireland in 1886 and 1892–95, and for India, 1905–10. Biographer of Gladstone, Voltaire, Rousseau, Burke, Walpole, Cromwell, and Cobden.

Morley, Thomas (*c.* 1557–1603), English Elizabethan composer of madrigals, noted also for his settings of some of Shakespeare's songs. He was a pupil of Byrd, organist of St. Paul's Cathedral, and wrote an important theoretical work *Plaine and Easie Introduction to Practicall Music* (1597).

Morris, William (1834–96), poet and craftsman. His hatred of 19th-cent. ugliness, his belief in human equality, and in freedom and happiness for all, conspired to make him a socialist, and he accomplished much for the improvement of domestic decoration. He was a popular lecturer, founded the Socialist League and the Kelmscott Press. *See* **Arts and Crafts Movement, L9.**

Morrison of Lambeth, Herbert Stanley, Baron, P.C., C.H. (1888–1965), entered Parliament as Labour M.P. for S. Hackney in 1923. Leader of the L.C.C. 1933–40. Dep. Prime Min. and Leader of the House of Commons in the Labour administration, 1945–51. Life peerage conferred, 1959.

Morse, Samuel Finley Breese (1791–1872), an American artist and designer, who became the inventor of the Morse system of electric telegraphs, and of the Morse code of signals.

Moseley, Henry Gwyn-Jeffreys (1887–1915), lecturer in physics under Rutherford at Manchester Univ., 1910–12. Made great contributions to the theory of the structure of the atom. Killed at Gallipoli.

Mountbatten of Burma, 1st Earl, Admiral of the Fleet, P.C., K.G., G.C.B., G.C.V.O., D.S.O. (b. 1900), naval officer and statesman. Chief of Combined Operations, 1942–43; Supreme Allied Commdr. S.E. Asia, 1943–46; Viceroy of India, Mar.–Aug. 1947 and first Gov. Gen. of Dominion of India, Aug. 1947–June 1948. Resuming his naval career in 1948 he has served successively as Flag Officer Commanding the 1st Cruiser Squadron, Mediterranean, Fourth Sea Lord, C.-in-C. Mediterranean, C.-in-C. Allied Forces, Mediterranean, and First Sea Lord and Chief of Naval Staff, 1955–59, Chief of the Defence Staff, 1959–65.

Mountevans, Admiral Lord, K.C.B., D.S.O. (1881–1957), "Evans of the Broke," British sailor and explorer. Author of *South with Scott.*

Mozart, Wolfgang Amadeus (1756–91). The composer who bears this immortal name is universally acknowledged as the world's greatest musical genius. He was born at Salzburg began his musical career at the age of four toured the European courts as an infant prodigy, left the service of the Archbishop of Salzburg in his twenty-sixth year to live in Vienna where his friendship with Haydn began and where his greatest music was written. Mozart's genius lies in the effortless outpouring of al forms of music, in the ever-flowing melodies, in the consistent beauty and symmetry of his compositions, and in the exactness of his method. Among the loveliest and grandest works in instrumental music are his three great symphonies in E flat, in G minor, and in C (called the "Jupiter"), all written in six weeks in 1788. Three of the greatest operas in musica history are his *Marriage of Figaro* (1786), *Don Giovanni* (1787), and *The Magic Flute* (1791) His last composition, written under the shadow of death, was the Requiem Mass, a work o tragic beauty. *See* **Section E.**

Müller, Ferdinand von, Baron (1825–96), German botanist and explorer. Director of the Botanical Gardens at Melbourne, 1857–73. Introduced the eucalyptus into the south of Europe and other regions, and took leading part in promoting Australian exploration.

Mumford, Lewis (b. 1895), American social historian and authority on town planning and urban culture. His major work is the trilogy *Techniques and Civilization* (1934), *The Culture of Cities* (1938), *The Condition of Man* (1944).

inkacsy, Michael von (1844–1900), a celebrated Hungarian painter of historical subjects.

nnings, Sir Alfred James, K.C.V.O. (1878–1959), British painter whose country scenes and pictures of horses have gained him world-wide fame. P.R.A., 1944–49.

irdock, William (1754–1839), engineer and inventor, one of the first to introduce gas lighting.

irillo, Bartolomé Esteban (1617–82), one of the greatest Spanish painters. His chief works are altar-pieces and religious subjects.

irray, (George) Gilbert (Aime), O.M., D.Litt., D.C.L., LL.D. (1866–1957), classical scholar and humanist whose verse translations of Euripides are known throughout the world. Became Professor of Greek at Glasgow at early age of 23; Regius Professor of Greek at Oxford, 1908–36; Chair. League of Nations Union, 1923–38; Pres. U.N. Ass. until his death.

issolini, Benito (1883–1945), Fascist dictator of Italy, 1922–43. From 1935 an aggressive foreign policy in Abyssinia, Spain, etc., was at first successful, and in June 1940, he entered the second world war on the side of Germany. The defeat of Italian arms in North Africa and the invasion of Sicily caused the collapse of his Government, but he was rescued from imprisonment by parachutists. Executed two years later by partisans.

issorgsky, Modest Petrovich (1839–81), Russian composer whose masterpiece is the opera *Boris Godunov* after the play by Pushkin. His piano suite *Pictures at an Exhibition* was orchestrated by Ravel. *See* Section E.

N

nsen, Fridtjof, G.C.V.O., D.Sc., F.R.G.S. (1861–1930), the Norwegian explorer who, after two or three expeditions across Greenland, in 1893 started out on his famous North Polar expedition when he reached the highest latitude until then attained—86° 14′—a feat later eclipsed by the Duke of the Abruzzi and by Peary, as well as by airship or aeroplane. He published a fascinating narrative of his exploration under the title of *Farthest North*. Active in Russian famine relief, 1921. Awarded Nobel Prize for Peace, 1922.

pier, John (1550–1617), mathematician, who made important contribution to the advance of astronomy and other branches of science by his invention of logarithms (published 1614).

poleon I. (Bonaparte) (1769–1821) was born at Ajaccio in Corsica. Sent to France to receive military education and was a captain at the age of twenty. In 1794 served in Italy with such distinction that he won a generalship, and next year was appointed Commander-in-Chief. A series of most brilliant successes followed. He defeated the Austrian forces in 1797, conducted an expedition to Syria and Egypt in 1798, returned in 1799 to find himself the most popular man in France, and in November of that year he proclaimed himself First Consul. In 1800 he was again in Italy and once more victorious. In 1804 he was made Emperor, and the following year was in the field against England, Russia, and Austria, achieving a splendid series of victories at Austerlitz and elsewhere, and practically became Dictator of Europe, distributing kingships amongst his brothers in the most profuse manner, Joseph becoming King of Naples, Louis King of Holland, and Jerome King of Westphalia. His invasion of Russia was disastrous, the Peninsular War went against him, and in 1814 the Allies entered Paris and forced him to abdicate. He was sent to Elba, but made his escape in the following year, gathered his old army about him and went forth to meet the English and Prussian armies. He was finally defeated at Waterloo on 8 June 1815, and held in captivity on the lonely island of St. Helena, where he died. His remains were removed to Paris in 1840, and rest in a magnificent tomb. Recent evidence suggests that he may have been murdered by arsenic poisoning.

poleon II. (1811–32) was the son of Napoleon I. and Maria Louisa. Was born in Paris and proclaimed King of Rome, but died of consumption when only twenty-one, being known at the time of his demise as the Duke of Reichstadt.

Napoleon III. (1808–73) was the son of Louis Bonaparte, King of Holland, and of Hortense, daughter of the Empress Josephine. After unsuccessful attempts to secure the French throne and years of imprisonment he took advantage of the revolution of 1848 to return to France and, following the famous *coup d'état* of December 2, 1851, emerged as master of France and was proclaimed Emperor the following year. Married Eugénie de Montijo in 1853. Dictatorial and discredited at home, unsuccessful in his foreign adventures, his surrender at Sedan in the Franco-Prussian war of 1870 brought ruin to the Second Empire, and France once again became a republic. Louis Napoleon took refuge in England and died at Chislehurst in Kent.

Nash, John (1752–1835), architect. Planned Regent Street, laid out Regent's Park, enlarged Buckingham Palace, and designed Marble Arch and the Brighton Pavilion.

Nash, Paul (1889–1946), distinguished English painter and designer. Official war artist in both world wars. Best known pictures *The Menin Road* of 1918 and *Totes Meer* of 1941.

Nash, Rt. Hon. Walter (b. 1882), New Zealand Labour politician; Prime Min., 1957–60. Resigned party leadership 1963.

Nasmyth, James (1808–90), the inventor of the steam-hammer, which became indispensable in all large iron and engineering works.

Nasir (Nasser) Col. Gamal Abd al- (b. 1918), first President of the first Egyptian Republic and influential leader of the Arab world. Fought in Palestine War of 1948–49 and organised the military *coup* of July 23, 1952, which brought the abdication of King Farouk. His two most important actions have been the nationalisation of the Suez Canal and the building, with Russian help and finance, of the Aswan High Dam.

Nehru, Pandit Jawaharlal (1889–1964), Indian statesman and one of the world's great leaders; Prime Min. and Min. of Foreign Affairs, 1947–64. Educated at Harrow and Cambridge where he studied science and law. A leading member of the Congress Party for many years, during which he was frequently imprisoned for his political activities. Played distinguished part in the final negotiations for the independence of India. Under his enlightened leadership India made dramatic technical, industrial, and social advances. *See also* **Section C, Part I.**

Nelson, Horatio, Viscount, K.C.B. (1758–1805), the great English naval commander; son of a Norfolk clergyman. Went to sea at twelve years of age, and was post-captain at twenty-one. In 1793 he was captain of the *Agamemnon* and proved his capacity and daring against the French. He lost his right eye at the siege of Calvi in 1794, and his right arm at the siege of Santa Cruz in 1797. In 1798 he achieved a great victory over the French in Aboukir Bay, in recognition of which he was created a Baron and granted a pension of £2,000 a year. Victorious at Copenhagen in 1801, he was promoted to the rank of Viscount. In 1805 the French fleet was destroyed at Trafalgar and Nelson was killed. Buried in St. Paul's Cathedral.

Nenni, Pietro (b. 1883), Italian politician and Secretary-General of the Italian Socialist Party since 1944. Minister of Foreign Affairs, 1946–47.

Nernst, Walther Hermann (1864–1941), German scientist who established the third law of thermodynamics. Nobel Prizeman, 1920.

Nero, Claudius Cæsar (A.D. 37–68), the Roman Emperor whose reign of fourteen years was rendered infamous by his cruelty and licentiousness.

Newcomen, Thomas (1663–1729), was one of the first to put a steam-engine into practical operation, and in 1705 patented his invention, which was the pumping-engine used in Cornish mines until the adoption of Watt's engine.

Newman, Ernest (1868–1959), English music critic successively of *The Manchester Guardian*, *The Birmingham Post*, *The Observer*, and of *The Sunday Times*, 1920–58. Outstanding among his numerous writings is the *Life of Richard Wagner*.

Newman, John Henry, Cardinal (1801–90). Educated at Oxford, he was incumbent of St. Mary's there from 1828 to 1843, taking an active part in the religious discussions of the time, gradually showing a tendency to adopt Roman Catholic views, and ultimately allying himself with the Romanists, resigning his living and settling at Edgbaston, Birmingham, as the head of a community of the Order of St. Philip Neri. In his *Apologia pro Vita Sua* he described the development of his religious thought. The hymn *Lead, kindly Light*, and the *Dream of Gerontius* were written by him.

Newton, Sir Isaac, F.R.S. (1642–1727), generally acknowledged as the world's greatest man of science. Achieved immortal fame for his work on the nature of white light, the calculus and gravitation Greatest published work, the *Principia*, was produced in 1687, revolutionising the scientific thought of his time. Was Member of Parliament for Cambridge in 1688, Master of the Mint in 1699, and President of the Royal Society from 1703 till his death. Honoured with knighthood in 1705.

Ney, Marshal Michel (1769–1815), was one of Napoleon's most noteworthy generals.

Nicholas II., Ex-Czar of Russia (1868–1918), son of the Emperor Alexander III. Came to the throne in 1894, and had a reign full of trouble, being unable to handle the difficulties by which he was beset. He avowed full harmony with the British and French in the war which opened in 1914, but the acts of the Empress and Court belied these pretensions, and a Revolution resulted in March, 1917 which overthrew the Romanoffs. Nicholas was detained a prisoner together with the Czarina and his children; all were probably shot on July 16, 1918.

Nicholas, St., Bishop of Myra and patron saint of Russia, flourished in the 4th century, and is popularly associated with Christmas under the corrupted name of Santa Claus.

Nicholson, Sir William (1872–1949), English painter, well known for his portraits, engravings and woodcuts as well as for his illustrations in the *Almanack of Twelve Sports* (with Kipling) and *London Types* (with Henley). His son, Ben Nicholson (b. 1894), also an artist, is noted for his abstract paintings.

Nicolson, Hon. Sir Harold, K.C.V.O., C.M.G. (b. 1886), author and critic, whose books include *The Congress of Vienna* (1946), *King George V.: His Life and Reign* (1952), *The Evolution of Diplomatic Method* (1954), *Good Behaviour* (1955). Married the **Hon. Victoria Sackville-West** (1892–1964), the novelist and poet.

Niemöller, Martin (b. 1892), German religious leader. A pastor in the Evangelical (Protestant) Church. Actively opposed the Nazification of the German Church and was incarcerated in a concentration camp throughout the second world war.

Nietzsche, Friedrich Wilhelm (1844–1900), German philosopher, in his younger years greatly influenced by the work of Wagner and Schopenhauer. His "superman" philosophy is eloquently expressed in his many writings, *i.e.*, *Thus spake Zarathustra*, *Beyond Good and Evil*, *The Will to Power*.

Nightingale, Florence, O.M. (1820–1910), English nurse and pioneer of hospital reform whose genius for administration was shown during the Crimean War, when she organised in face of considerable official opposition a nursing service to relieve the sufferings of the British soldiers who called her "The Lady with the Lamp." Her system was adopted and developed in all parts of the world, and she was honoured with a testimonial of £50,000, which she applied to the founding of the Nightingale Training School for Nurses, attached to St. Thomas's Hospital, London.

Nijinsky, Vaslav (1892–1950), Russian dancer, who was one of the famous company of dancers, which included Pavlova, Karsavina and Fokine, brought by Diaghilev to Paris and London just before the War of 1914–18, and was in some respects the most remarkable of them all. His sensational dancing in such Ballets as *Les Sylphides*, *Spectre de la Rose* and *Après-Midi d'un Faune* won him the supreme place among male dancers.

Nikisch, Arthur (1855–1922), famous Hungarian conductor, who appeared as a prodigy pianist at the age of eight, became chief conductor at the Leipzig Opera, 1879, conducted the Symphony Orchestra at Boston, 1889–93, afterwards paying visits to all the important citie of Europe.

Nimitz, Admiral of the Fleet Chester William 1885–1966), commanded the American fleet in th Pacific, 1941–45, together with army and marin forces. Chief of Naval Operations, 1945–47.

Nkrumah, Kwame (b. 1909), African leader whos country (Gold Coast) achieved independenc in 1957, and in 1960 became the Republic c Ghana. Prime Min. (1957) and Pres. (1960 Deposed (1966) by military coup while absen in Far East.

Nobel, Dr. Alfred Bernhard (1833–96), the inventor of dynamite, was a Swedish enginee and chemist who amassed a large fortune from the manufacture of explosives, a great portion of which at his death in 1896 he set apart a a fund for annual prizes to such persons a during each year shall have contributed mos materially to the benefit of mankind. *See* lis of Nobel Prizemen, L125–6.

Norrie, 1st Baron Lieut-Gen. (Charles) Willoughb (Moke), G.C.M.G., G.C.V.O., C.B., D.S.O., M.C (b. 1893), Gov.-Gen. and C.-in-C. of New Zealand, 1952–57; Governor South Australia 1944–52. Professional cavalry officer.

Norstad, Gen. Lauris (b. 1907), succeeded Gen Gruenther as NATO's Supreme Allied Commander, Europe, 1956–63.

Northcliffe, 1st Viscount (1865–1922), was one o the most prominent men in modern journalism Started *Answers* in 1888 with his brother, Ceci Harmsworth. In 1894 the Harmsworths purchased the *Evening News*, and in 1896 they started the *Daily Mail*. In 1917 was specia British representative in the United States.

Northumberland, John Dudley, Duke of (1502–53) an expert intriguer who dominated the Government of Edward VI. from 1549 onwards and attempted to maintain his influence when the king died by proclaiming as Queen his daughter-in-law Lady Jane Grey, but failed and was executed.

Nostradamus or Michel de Notre Dame (1503–66) French astrologer who acquired great distinction by his labours during the plague. Publ. i 1555 *Centuries*, a book of rhymed prophecies the fulfilment of some of which greatly adde to his reputation. *Centuries* was condemne by the papal court of 1781.

Novalis, the pseudonym of **Baron Friedrich vo Hardenberg** (1772–1801), German poet an novelist, representative of German romanticism His chief work was the novel *Heinrich vo Ofterdingen*, unfinished at his death.

Nuffield, 1st Viscount, William Richard Morris G.B.E., C.H. (1877–1963), industrialist and philanthropist and until he retired in 1952 Chairma of Morris Motors, Ltd. Established the Nuffiel Foundation, endowing it with £10 million, an provided large sums for the advancement c medicine in the University of Oxford.

Numa Pompilius, legendary king of Rome, to whom is ascribed Roman ceremonial law.

Nyerere, Julius (b. 1922), African statesman President of the United Republic of Tanzania 1964–. When Tanganyika attained independence in Dec. 1961 he was its first Prime Minister. An autobiographical account of his lif is given in Lady Listowel's *The Making c Tanganyika* (1966).

O

Oaksey, Geoffrey Lawrence, 1st Baron, P.C., Q.C D.S.O. (b. 1880), presided over the Internationa Military Tribunal which tried the major wa criminals at Nuremberg, 1945–46. A Lord c Appeal in Ordinary since 1947.

Oates, Captain Lawrence Edward Grace (1880–1912), a British explorer who, having seen activ service in the South African War, joined Cap Scott's Antarctic Expedition in 1910. He wa one of the sledge party who accompanied Scot in his final dash for the South Pole. On returning, the party became stormbound, and o March 17, 1912, Oates, crippled by frost-bite went out in the blizzard to die rather than b a burden to his starving comrades. Describe in Scott's diary as a very gallant gentleman.

Oates, Titus (1649–1705), a notorious informe against Roman Catholics in reign of Charles I

O'Casey, Sean (1883–1964), Irish dramatist of remarkable powers whose plays include *Juno an* *he Paycock*, *The Silver Tassie*, *Red Roses for Me*, and *Oak Leaves and Lavender*.

cam (Ockham), William of (*c.* 1270–1349), English scholar and philosopher and one of the most interesting, independent and original thinkers of all time. He belonged to the Order of Franciscans, violently opposed the temporal power of the Pope, espoused the cause of nominalism and laid the foundations of modern theories of government and theological scepticism. (See Occam's Razor, Section J.)

Connell, Daniel (1775–1847), the Irish "Liberator," as he was called, was a famous orator and politician and a highly successful barrister. In Parliament he advocated the cause of Ireland with courage and audacity.

Connor, Feargus (1796–1855), was an Irish lawyer who became the most influential figure in the Chartist movement.

Connor, Rt. Hon. Thomas Power (1848–1929), sat in Parliament from 1880 until 1929, being for many years father of the house, and was one of the most successful journalists and editors of his time. He founded several publications including the *Star*.

rsted, Hans Christian (1777–1851), the Danish physicist and chemist, whose discoveries in electrical research did much to help forward the invention of the electric telegraph.

fa was King of Mercia from *circa* 757 to 793, and had a war-like career: he built an embankment from the Dee to the Wye, 100 miles long, which was called Offa's Dyke. He imposed "Peter's Pence" as a gift to the Pope for absolution.

enbach, Jacques (1819–80), French composer, born of a Jewish family at Cologne. Was the composer of many light operas, including the posthumous *Les Contes d'Hoffmann* (*Tales of Hoffmann*), the most popular of all his works.

m, Georg Simon (1787–1854), was the discoverer of a law of electric current now known universally as Ohm's law. He was a native of Bavaria, professor at Munich from 1852, and gained much fame as a physicist and mathematician.

vier, Sir Laurence Kerr (b. 1907), British actor and director whose performances in Shakespearean and other roles have brought wide acclaim. He has also produced, directed, and played in many films, including Henry V., Hamlet, and Richard III. Director of the National Theatre.

nan, Sir Charles (William Chadwick), K.B.E. (1860–1946), English historian who was Chichele Professor of Modern History at Oxford, 1905–46 and M.P. for the University from 1919 to 1935. His works include a popular *History of Greece*, *A Short History of England*, which is a familiar school book, and a *History of the Art of War in the Middle Ages*.

nar Khayyám (*c.* 1050–1123), Persian poet and mathematician, called Khayyám (tent-maker) because of his father's occupation. His fame as a scientist has been eclipsed by his Rubaiyat, made known to English readers by Edward FitzGerald in 1859.

Neill, Eugene Gladstone (1888–1953), an American playwright who, after spending his adventurous youth in such activities as sailing, gold-prospecting, and journalism, first won success in 1914 with the one-act play, *Thirst*. His later plays include *Anna Christie*, *Strange Interlude*, *Mourning Becomes Electra*, *The Iceman Cometh*. *See also* Modern Drama.

chardson, Sir William Quiller (1835–1910), an eminent R.A.; among his best-known works are *Napoleon I. on board H.M.S. Bellerophon* and *Ophelia*.

gen (*c.* 185–*c.* 254), Christian philosopher and biblical scholar, famed for his teaching at Alexandria and Cæsarea. He attempted to synthesise Greek philosophy and Hebrew scriptures so as to prove the Christian view of the universe was compatible with Greek thought. In the persecution of Decius in 250 he was imprisoned, tortured, and pilloried.

pen, Sir William, K.B.E., R.A. (1878–1931), British portrait-painter; many of his celebrated war pictures were presented to the nation.

ega y Gasset, José (1883–1955), Spanish philosopher and essayist, one of the most eloquent men of our times. His *The Revolt of the Masses* (1932) brought him international fame.

Orwell, George (1903–50), English satirist, author of *Animal Farm* (1946) and *Nineteen Eighty-Four* (1949). His real name was Eric Blair; b. in India.

Osler, Sir William, Bt., M.D., F.R.S. (1849–1919), Canadian physician and medical historian; an authority on diseases of the blood and spleen.

Oswald, St., King of Northumbria from 625 to 642, established Christianity amongst his subjects.

Ouida, pseudonym of Louise de la Ramée (1839–1908), English novelist of flamboyant personality whose many romantic stories were very popular and included *Under Two Flags*, *A Dog of Flanders*, and *Moths*. Born at Bury St. Edmunds and buried at Bagni di Lucca in Tuscany. Her father was French.

Otto, Nikolaus August (1832–91), German inventor of the four-stroke cycle that bears his name.

Otto the Great (912–973), son of Henry the Fowler, crowned King of the Germans at Aachen in 936 and Emperor at Rome in 962. Overawed the papacy, checked the barbarian invasions, founded the East Mark (Austria), and considerably consolidated Germany.

Ovid (43 B.C.–A.D. 18), the famous Latin poet (Publius Ovidius Naso) whose *Metamorphoses* and *Art of Love* are among the best-known examples of Roman literature of the lighter kind.

Owen, Robert (1771–1858), socialist and philanthropist, devoted his life and fortune to the carrying out of his theories, and established socialistic colonies in Lanarkshire, Hampshire and America.

P

Pachmann, Vladimir de (1848–1923), Russian pianist, an unrivalled interpreter of the works of Chopin.

Paderewski, Ignace Jan (1860–1941), achieved unrivalled fame as a pianist and for half a century worked for the freedom of his native Poland. He represented his country at Versailles and became her first Prime Minister.

Paganini, Niccolo (1782–1840), Italian violinist and composer whose playing became a legend and brought him much fame and wealth. He ranks as first among virtuosi of the violin.

Paine, Thomas (1737–1809), English revolutionary writer, b. Thetford, Norfolk, son of a Quaker; emigrated to America (1774), becoming famous with the publication of his pamphlet *Common Sense* in favour of American independence. On return to England (1787) wrote *The Rights of Man* in reply to Burke's *Reflections on the Revolution in France*. This was extensively read but his attack on English institutions procured him a trial for sedition and he fled to France. There he wrote *The Age of Reason*, an attack on Christianity which excited great indignation in England. Returned to America where he lived his last years in solitude and ill-health.

Palestrina, Giovanni Pierluigi da (*c.* 1525–94), great Italian composer of unaccompanied church music and madrigals, among whose works are the *Missa Papae Marcelli* and the *Stabat Mater* for 8 voices, which is among the greatest musical glories of all time. *See* Section E.

Palgrave, Sir Francis (1788–1861), English historian, best known for his *A History of Normandy and England*. His son, **Francis Turner Palgrave** (1824–97), was Professor of Poetry at Oxford, and edited the famous anthology, *The Golden Treasury*. Another son, **William Gifford Palgrave** (1826–88), was a diplomat and prose writer of ability.

Palissy, Bernard (*circa* 1510–89), a distinguished French potter, who after years of struggle and self-denial discovered the art of producing white enamel, after which he became famous and set up a porcelain factory in Paris, which was patronised by Royalty.

Palladio, Andrea (1518–80), the great Italian architect, who introduced the style of architecture known as Palladian.

Palmer, John (1742–1818), originator of the mail-coach postal service in 1784.

Palmerston, Henry John Temple, 3rd Viscount (1784–1865), English statesman, was long dominant in European affairs because of his vigorous and popular policy. He spent many years of his life in office, serving as Tory Secretary for War from 1808 till 1828 as Foreign Secretary in all the Whig cabinets between 1830 and 1851, and as Prime Minister in 1855 and from 1859 until his death. He had a lofty conception of the strength and duties of England and was the irreconcilable foe of oppression and injustice.

Pancras, St., the patron saint of children, was the son of a Roman noble, was baptised in Rome in the reign of Diocletian, where he was put to death at the age of fourteen for refusing to renounce Christianity.

Pandit, Vijaya Lakshmi (b. 1900), Gov. of Maharashtra, 1962–64; elected to Lok Sabha, 1964; Indian High Comm. in London, 1954–61. India's first Ambassador to the Soviet Union (1947–9) and to the United States (1949–51), the first woman to be elected Pres. of the U.N. General Assembly (1953–4). Sister of **Jawaharlal Nehru.**

Panizzi, Sir Anthony, K.C.B. (1797–1879), an Italian political exile, who in 1831 was appointed to the Assistant Librarianship and Keepership of the Printed Books of the British Museum. In 1856 he became Principal Librarian, retiring in 1866. The great Reading Room was constructed from his designs.

Pankhurst, Emmeline (1858–1928) was a prominent and indefatigable worker for women's suffrage, together with her daughters Dame Christabel and Sylvia.

Papin, Denis (1647–1714), a French mathematician and scientist who settled in England. He invented the condensing pump, and was a pioneer in the development of the steam engine. Not being a mechanic, he made all his experiments by means of models.

Paracelsus, Philippus Aureolus (1493–1541), a famous Swiss mystic and alchemist. He made numerous important discoveries, being the first to employ laudanum and antimony in pharmacy. The English translation of his *One Hundred and Fourteen Experiments and Cures* appeared in 1596. His real name was Theophrastus Bombastus von Hohenheim.

Park, Mungo (1771–1806), famous British traveller who in 1799 published an arresting account of his *Travels in the Interior of Africa.*

Parker, Rev. Joseph (1830–1902), a popular Nonconformist preacher and author who built the City Temple, and ministered there up to the time of his death.

Parnell, Charles Stewart (1846–91), the Irish politician, who as leader of the Nationalist Party made it more powerful than it had ever been and successfully enlisted the support of Gladstone for the policy of Home Rule. Accused by *The Times* of complicity in the crimes of the Land League on the basis of letters forged by Richard Pigott, he was completely vindicated by a Royal Commission and awarded heavy damages. Was dropped from the leadership of his party following the O'Shea divorce proceedings and died soon afterwards.

Parry, Rear-Admiral Sir William Edward (1790–1855), an Arctic explorer and naval commander of great distinction, who undertook several expeditions to the Polar regions and made numerous important discoveries.

Parsons, Hon. Sir Charles Algernon, O.M., K.C.B., F.R.S. (1854–1931), was head of the electrical and engineering works of C. A. Parsons and Co., and of the Parsons Marine Steam Turbine Co., Ltd., Newcastle-on-Tyne, and inventor of the steam turbine which has effected a remarkable improvement in the propulsion of war and mercantile vessels.

Partridge, Sir Bernard (1861–1945), began life as a stained glass designer, afterwards worked at book illustrations, and for a time was on the stage. Joined *Punch* staff 1891, and for many years was its principal cartoonist.

Pascal, Blaise (1623–62), celebrated French mathematical genius and religious philosopher whose *Provincial Letters* are one of the world's literary masterpieces. At the age of nineteen he invented an ingenious adding machine and was the first to demonstrate the barometric effects of altitude.

Pasternak, Boris Leonidovich (1890–1960), Russian poet and writer. Translations of his great novel *Dr. Zhivago* appeared in 1958, though it was forbidden in the Soviet Union. In that year he was awarded—though he declined it—the Nobel Prize for Literature "for his important contributions both to contemporary lyric poetry and to the great Russian narrative tradition."

Pasteur, Louis (1822–95), French chemist, whose work was inspired by an interest in the chemistry of life which abided with him until his death. His researches on fermentation led to the science of bacteriology and his investigations into infectious diseases and their prevention to the science of immunology. The pathological bacteriological import of Pasteur's researches came about mainly through his disciples (Lister, Roux, and others) and not directly, though all founded on his early non-medical investigations on organisms of fermentation, etc., which were of great importance in industry, and fundamentally. He spent most of his life as director of scientific studies at the Ecole Normale at Paris, where he was appointed in 1857. The Institut Pasteur was founded in 1888.

Patmore, Coventry (1823–96), poet of the Victorian era, and author of *The Angel in the House.*

Paton, Sir (Joseph) Noel (1821–1901), Scottish painter, sculptor, historical artist, archæologist, and poet.

Patrick, St. (*c.* 387–*c.* 463), the patron saint and Apostle of Ireland, was for many years a great and successful Christian missionary in that country. Few authentic facts about his life are known, but many miraculous stories, such as his alleged extermination of serpents in the island, have been associated with him.

Patti, Adelina Juana Maria (Baroness Cederström) (1843–1919), coloratura soprano, b. in Madrid of Italian parents, unsurpassed for purity o tone and style.

Pattison, Dorothy Wyndlow (1832–78), a sister o Mark Pattison, who devoted a great part of her life to hospital work in Walsall, where, as "Sister Dora," she is revered for her saintly life and devotion to the sick poor.

Pattison, Mark (1813–84), scholar and critic, rector of Lincoln College, Oxford. His wife, Emilia Francis Strong (afterwards Lady Dilke), was well known as a French art historian.

Paul VI, Pope (Giovanni Battista Montini) (b 1897), elected pope in 1963 on the death of John XXIII. Formerly Archbishop of Milan. Made pilgrimage to Holy Land in Jan. 1964.

Pavlov, Prof. Ivan Petrovich (1849–1936), an eminent Russian physiologist: Director of the Physiological Institute. Foreign member o the Royal Society and Nobel Prize-winner.

Pavlova, Anna (1885–1931), one of the greatest exponents of the Russian school of dancing.

Peabody, George (1795–1869), an American mer chant who lived for the greater part of his life in London, and, acquiring a large fortune bequeathed immense sums for philanthropic purposes in England and the United States.

He was thrown rom his horse in Hyde Park on June 25th, 1850, nd died from injuries.

nfield, Wilder Graves, O.M., M.D., M.A., D.Sc., .R.S. (b. 1891), Canadian brain surgeon; Dir. Iontreal Neurological Institute; Prof. of Neurosurgery McGill Univ.; Pub. *The Cerebral Cortex of Man* (1950), *Epilepsy and the Func-ional Anatomy of the Human Brain* (1954).

n, William (1644–1718), became a Quaker, and vrote some powerful pamphlets supporting is new faith. He devoted himself to good vorks, and in 1682, having obtained a special rant from King Charles II., went to America nd founded Pennsylvania.

ney, Sir William George, K.B.E., M.A., Ph.D., .Sc., F.R.S. (b. 1909), British scientist; Chair. J.K. Atomic Energy Authority, 1964–7. After 3 years in atomic research and development, eturned to academic life in 1967 to become Rector of Imperial College. His nuclear research eam at AEA developed the advanced gas-cooled eactor (AGR) chosen for the new power stations o be built at Dungeness and Hinckley Point.

ys, Samuel, F.R.S. (1633–1703), naval administrator, sometimes called the "Father of he British Civil Service." The *Diary* was vritten while he was a comparatively young nan and is a unique revelation of a man and is age, besides including eye-witness descrip-ions of the Great Plague and Fire of London.

golesi, Giovanni Battista (1710–36), Italian omposer, best known for his humorous opera *La Serva Padrona* and his *Stabat Mater*.

icles (*c.* 490–429 B.C.), the distinguished Athen-an statesman, general, and orator, who raised thens to the point of its fullest prosperity.

kin, Sir William Henry, F.R.S., D.Sc. (1838–907), great organic chemist and famous for his iscovery of mauve, the first synthetic dye.

kin, William Henry (junior) (1860–1929), oremost organic chemist of his day; Professor f Organic Chemistry at Manchester University, 892–1912 and later at Oxford. His researches ed to important industrial results.

rin, Francis (b. 1901), French scientist and ocialist; succeeded Joliot-Curie as High ommr. for Atomic Energy in 1951. Prof. tomic Physics, Collège de France, 1946– .

sius Flaccus, Aulus (A.D. 34–62), a famous Stoic hilosopher.

ugino, Pietro (1446–1524), Italian artist who ex-elled in religious subjects and painted many ne frescoes including some in the Sistine Chapel t Rome. Raphael was his pupil.

talozzi, Johann Heinrich (1746–1827), Swiss ducational reformer whose theories laid the oundation of modern primary education. His eaching methods were far in advance of his me, but are now employed with outstanding uccess in schools in many parts of the world.

ain, Marshal Henri Phillipe (1856–1951), be-ame a French national hero after the successful efence of Verdun in 1916 and was made C.-in-C. all the French armies. In 1940 he became rime Minister, signed an armistice with Ger-any, and set up a quasi-independent adminis-ation at Vichy. In 1945 he was sentenced to eath for treason, the sentence being commuted life imprisonment.

r I, called The Great (1672–1725). Czar of ussia, showed great ability and energy of haracter, devoting himself largely to the re-ganisation of his army and navy. He spent me months at Deptford studying shipbuilding. e founded St. Petersburg (1703), which was his window on to Europe," and gained control in e war with Sweden of Karelia, Ingermanland, d Livonia. Among the prisoners taken by m at the Battle of Poltava (1709) was Cathe-ne Skavronsky, daughter of a Lithuanian asant, whom he later married. By her care and derstanding she did much to strengthen his wer. Peter died without naming an heir, and therine became Empress of Russia (1725–27).

r, the Hermit (*c.* 1050–1115), was the main strument of the agitation which brought about e first Crusade. He was a French monk, of eat eloquence and earnestness, and lived to e Jerusalem in the hands of the Christians.

arch, Francesco (1304–74), Italian poet and scholar, whose odes and sonnets *To Laura* are unmatched for their lyrical beauty and passion.

Petrie, Sir (William Matthew) Flinders, F.R.S. (1853–1942), British egyptologist; carried out excavations in Britain (1875–90), Egypt (1880–1924), and Palestine (1927–38); Prof. of Egyptology at University College, London, 1893–1935.

Phidias, the greatest of Greek sculptors, flourished from about 500 to 432 B.C., was specially famous for his work in gold, ivory and bronze. Nothing now remains to attest his genius although the sculptures in the British Museum, widely known as the Elgin Marbles, may have been from his designs.

Philip II. of France (1180–1223), was a prominent figure in the third Crusade, in which for a time he associated himself with our Richard I. Victor over a strong coalition at the momentous battle of Bouvines in 1214.

Philip II. of Macedonia (382–336 B.C.), trained in military arts in Greece, when he came to the throne instilled martial ideas into his subjects, and entered upon a career of conquest that did not end until he had become master of Greece. Father of Alexander the Great.

Philip II. of Spain (1527–98), succeeded his father the Emperor Charles V. in half his dominions. The Revolt of the Netherlands, the annexation of Portugal in 1580, and the unsuccessful attempt to subdue England by the Armada, were outstanding events of his troubled reign. He was a devout Roman Catholic, strongly supported the Counter-Reformation, built the strange Escorial, and was four times married, his second wife being Mary Tudor.

Philip V. of Spain (1683–1746), founded the Bourbon dynasty in Spain, and was the son of the Dauphin of Louis XIV. and Maria Theresa of Spain. His uncle, Charles II. of Spain, bequeathed the kingdom to him, and this led to the war of the Spanish Succession, which ultimately confirmed him in his kingship.

Phillip, Arthur (1738–1814), first governor of New South Wales. Under his command the first fleet of 717 convicts set sail from Britain to Australia, and with the founding of Sydney in 1788 colonisation of the whole country began.

Phillips, Stephen (1868–1915), dramatist and poet of distinction. Wrote popular verse dramas, including *Paolo and Francesca*, *Herod*, and *Ulysses*.

Piasts, first Polish dynasty in Poland until 14th century and until 17th century in Silesia.

Piazzi, Giuseppe (1746–1826), an Italian astronomer. He was the discoverer of the planet Ceres, the first known of the asteroids.

Picasso, Pablo Ruiz (b. 1881), Spanish painter; received his early training in Catalonia and settled in Paris in 1903. He and Braque were the originators of Cubism (*c.* 1909). His influence over contemporary art is comparable with that exercised by Cézanne (*q.v.*) over the artists of his time. Perhaps the best known single work is his mural *Guernica*, painted at the time of the Spanish civil war, expressing the artist's loathing of fascism and the horrors of war. His genius has also found scope in sculpture, ceramics, and the graphic arts, and he has designed décor costumes for the ballet.

Piccard, Auguste (1884–1962), Swiss physicist, noted for his balloon ascents in the stratosphere, and his submarine research. In 1960 his son, Jacques Piccard, made a descent of over 7 miles in the Marianas trench in the western Pacific in a bathyscaphe designed and built by him.

Pickford, Mary (b. 1893), was the leading film actress of the silent days and affectionately known as "the world's sweetheart."

Pilsudski, Joseph (1867–1935), Polish soldier and statesman. Led unsuccessful Polish attack on Russia in 1920 seeking the restoration of the 1772 frontiers. Exercised military dictatorship from 1926 until his death.

Pindar (522–443 B.C.), the eminent lyric poet of ancient Greece.

Pinero, Sir Arthur Wing (1855–1934), was an able English dramatist and former actor, of Portuguese descent. *Dandy Dick*, *The Second Mrs. Tanqueray* and *Mid-Channel* are among his plays.

Pirandello, Luigi (1867–1936), Italian dramatist and novelist. Awarded Nobel Prize for Literature, 1934.

Pissarro, Camille (1830–1903), French Impressionist painter of landscapes; studied under Corot.

Pitman, Sir Isaac (1813–97), founded the Pitman system of phonographic shorthand.

Pitt, William (1759–1806), was the second son of the Earl of Chatham. Entered Parliament at twenty-one, and by his brilliant oratory captivated the House of Commons. In 1782, when only twenty-three, he became Chancellor of the Exchequer, and in the following year was made Premier, and held that office for seventeen years, through the trying period of the French Revolution, when war with France was almost continuous. He was undoubtedly one of the most brilliant statesmen that England has produced, and his death at the early age of forty-six was a great loss to the country. He was buried in Westminster Abbey.

Pius XII. (1876–1958), elected Pope, March 2, 1939. As Cardinal Eugenio Pacelli, he was Papal Secretary of State, 1930–39, and was outspoken in his condemnation of communism. Before he became a Cardinal he was for many years Papal Nuncio in Germany. He was a brilliant diplomat but has been criticised for his failure to protest publicly against the crimes of the Nazi regime.

Pizarro, Francisco (*c.* 1478–1541), was an adventurous Spaniard who, after Columbus's discoveries in the New World, set out for South America, overthrowing the Inca empire and conquering Peru for the Emperor Charles V.

Planck, Prof. Dr. Max (1858–1947), German physicist, whose investigations into radiation of energy culminated in 1901 in his law of radiation, which laid the foundation of the quantum theory. Awarded Nobel Prize for Physics, 1918.

Plato (427–347 B.C.), great Athenian philosopher, pupil of Socrates, teacher of Aristotle. He founded a school at Athens under the name of the Academy, where he taught philosophy and mathematics. His great work is his *Dialogues*, which includes the *Republic*, the longest and most celebrated of them all. All Plato's known writings have come down to us, and they constitute one of the most influential bodies of work in history.

Playfair, Lyon (1818–98), a far-sighted Victorian who stood for the greater recognition of science in national life. He forsook his profession as professor of chemistry at Edinburgh to enter Parliament. Pres. of the British Association in 1885.

Plimsoll, Samuel (1824–98), was a native of Bristol, and while M.P. for Derby got up an agitation on behalf of merchant sailors, procuring the passing of the Merchant Shipping Act of 1876, which by defining a line above which no ship must sink in the water when loaded has ever since made the overloading of ships illegal. The line is known as the Plimsoll Mark.

Pliny the Elder (A.D. 23–79), Roman naturalist who dedicated his great work *Natural History* to the Emperor Titus. He died of fumes and exhaustion while investigating the eruption of Vesuvius. Was a member of the Cape Legis lature in 1881, and became Premier in 1890 He was at the head of the British South Afric Chartered Company, for which a vast amoun of territory was annexed, the holding obtainin the name of Rhodesia. Mr. Rhodes was Cap Premier again in 1896; then followed th Jameson Raid and his retirement from politica life. During the Boer War he was detained i Kimberley and did not live to see the cam paign closed. He left the bulk of his fortun for the founding of scholarships at Oxford.

Ricardo, David (1772–1823), a celebrated Englis political economist of Hebrew descent, whos *Principles of Political Economy* gained him high place among the exponents of the science

Richard I. (1157–99) was King of England fron 1189 to his death. He laid heavy burden upon the people in order to equip an army fo the third Crusade. At first he was victoriou and did such valiant deeds that he receive the name of "Cœur de Lion." Being ulti mately defeated, he signed a truce with Saladin and on his way back to England was ship wrecked. Disguised as a pilgrim, he wa identified in Austria, and handed over to th Emperor of Germany, who imprisoned him i a remote castle. A large sum was demande and paid for his ransom, and after over a yea of durance he returned to England, and wa crowned at Winchester. Later he was engage in a war with France, and was mortally wounde by a bolt from a crossbow while besieging th castle of Chaluz in the province of Limousin.

Richard II. (1367–1400), son of the "Blac Prince," succeeded his grandfather, Edwar III., in 1377, when but ten years old, a Regenc being appointed during his minority. In th Wat Tyler rising of 1381 the King confronte the rioters and promised them redress, an under taking which he did not fulfil. For a time h was greatly under the influence of his uncl Thomas, Duke of Gloucester, but on coming o age dismissed him, and ruled with some ap proach to dignity for the next seven years After 1396 he developed a highly tyrannica disposition and banished or put to death many o the leading statesmen. The opposition agains him came to a head in 1399, when Bolingbrok defeated him, and he was made prisoner and die —probably by starvation—in Pontefract Castl

Richard III. (1452–85), last Plantagenet king o England who took the throne on the death o his brother Edward IV. in 1483, probably mu dering his two younger nephews in the Towe This led to a rebellion in favour of the Earl o Richmond (later Henry VII.) and he was sla on Bosworth Field. His character has bee the subject of dissension among historians bu there is no doubt that despite his unscrupulous ness (not uncommon in those days) he was brave soldier and able administrator.

Richards, Sir Gordon (b. 1904), British jockey wh had one of the most successful riding records the history of the British Turf: 21,834 mount 4870 winners, including the Derby (1953 Retired, 1954.

Richardson, Sir Albert Edward, K.C.V.O., P.R.A F.S.A., F.R.I.B.A. (1890–1964), British arch tect and Pres. of the Royal Academy, 1954–5

Richardson, Henry Handel, pseudonym of **Henr etta Richardson Robertson** (1870–1946), Au tralian novelist whose major work, outstanding in Australian fiction, is the trilogy *The Fortunes of Richard Mahony*.

chardson, Sir Owen Williams, D.Sc., F.R.S. (1879–1959), distinguished English physicist. Awarded Nobel Prize in 1928 for his researches on the emission of electricity from hot bodies.

chardson, Sir Ralph David (b. 1902), actor who has made many appearances on stage, screen, and radio.

chardson, Samuel (1689–1761), author of *Pamela*, *Clarissa*, and *The History of Sir Charles Grandison*, exercised considerable influence on the development of the novel in England.

chelieu, Armand Jean du Plessis, Cardinal Duc de (1585–1642), the eminent French ecclesiast and statesman, who was Minister to Louis XIII. for eighteen years. He was practically Master of France during the best part of this Cardinalate.

dley, Nicholas (1500–55), was Bishop of Rochester in 1547 and Bishop of London in 1550. He took an active part in the Reformation. He was burned at the stake along with Latimer.

enzi, Cola di (1313–54), a Roman patriot of humble birth who inflamed the people against their rulers, and aroused such enthusiasm that they proclaimed him "Tribune." During the seven months that he was permitted to exercise supreme power, he proved himself the true friend of the poor. Later murdered in a popular uprising.

lke, Rainer Maria (1872–1926), German lyric poet, born in Prague. His work, marked by great beauty of style, culminated in the *Duineser Elegien* and *Sonette an Orpheus*.

mbaud, Jean Nicolas Arthur (1854–91), French poet of great originality and friend of Paul Verlaine. All his poems were written between his sixteenth and nineteenth years.

msky-Korsakov, Nikolai Andreyevich (1844–1908), Russian composer whose works include the operas *The Maid of Pskov* (also known as *Ivan the Terrible*), *The Snow Maiden*, *Le Coq d'Or*, and the symphonic suite *Scheherezade*. He was a brilliant orchestrator and rescored many works, including Borodin's *Prince Igor*.

zzio, David (*c.* 1540–66), was the Italian secretary of Mary Queen of Scots and an accomplished musician. Suspected of a too great attachment to Mary, he was murdered by Darnley and his friends in the Queen's presence in the Palace of Holyrood.

bbia, Luca Della (1400–1482), a famous Florentine sculptor. He was the introducer of enamelled terra-cotta work.

bens, Rt. Hon. Alfred, Baron (b. 1910), Chairman, National Coal Board, 1961– ; Parl. Sec. Min. of Fuel and Power, 1947–51; Min. of Labour and National Service, 1951.

berts, Field-Marshal Earl, V.C., K.G., P.C., K.P., G.C.B., O.M., G.C.S.I., G.C.I.E. (1832–1914), the distinguished soldier, first saw service in the Indian Mutiny, when he won the V.C. In 1880 during the Afghanistan campaign made his historic march from Kabul to Kandahar where he won a complete victory. After serving as C.-in-C., India, 1885–93, and as C.-in-C., Ireland, 1895–99, took over in South Africa in December, 1899, and entirely reversed the unhappy military situation before handing over to Kitchener a year later. C.-in-C. from 1901 until the office was abolished in 1904, and was latterly an ardent advocate of conscription.

bertson, Sir Charles Grant, C.V.O. (1869–1948), English historian who was Vice-Chancellor of Birmingham University, 1927–38, and Principal 1920–38. His works include *The Rise of the English Nation*, 1895, *England under the Hanoverians*, 1911, and *Bismarck*, 1918.

bertson, Field-Marshal Sir William, Bt., G.C.B., G.C.M.G., G.C.V.O., D.S.O. (1860–1933), the only British soldier to rise from Private to Field-Marshal, served as C.I.G.S., 1915–18. His son, **Brian Hubert, Lord Robertson**, G.C.B. (b. 1892), has had a distinguished military career and was Chairman of the British Transport Commission, 1953–61.

beson, Paul Le Roy (b. 1898), the famous Negro singer and actor, who through his singing of spirituals has increased our knowledge and understanding of the Negro. Was a great success in London in 1930 playing *Othello*.

espierre, Maximilien François Marie Isidoire de (1758–94), was a country advocate until the outbreak of the French Revolution, when he went to Paris, became an enthusiastic leader of the Jacobin Party, and was made a Member of the Assembly. In the Reign of Terror as President of the Committee of Public Safety he sent vast numbers to the guillotine. Then a counter-movement was set on foot and he was denounced in the Assembly, and, trying to escape, was shot and subsequently guillotined.

Robey, Sir George, C.B.E. (George Edward Wade), (1869–1954), famous British comedian of the music-hall.

Robinson, William Heath (1872–1944), English book illustrator, but especially known for the fantastically comic designs of his cartoons and stage scenery.

Rob Roy (the traditional nickname of **Robert McGregor**) (1671–1734), a noted Highland outlaw who levied blackmail on the farmers and rich people of the country-side in return for certain protective services. He belonged to the clan McGregor.

Robsart, Amy (1532–1560), daughter of Sir John Robsart, and wife of Robert Dudley, afterwards Earl of Leicester. While living in seclusion at Cumnor Place under the charge of Anthony Forster, she met her death either by accident or foul play, by the latter according to common belief, Elizabeth's favourite having reason to wish her out of the way. She was discovered dead at the bottom of an old staircase.

Rockefeller, John Davison (1839–1937) was said to be the richest man in the world. Was born on a small farm in New York State, and there worked until sixteen. Migrated to Cleveland, and found employment in an office for a few years. About this time the oil trade was in a disorganised condition, owing to the reckless trading and crude methods of refining. Rockefeller saw what was wrong, and resolved upon trying to remedy it. Later he began oil-refining, and entered into the business with such vigour of purpose, and made so many improvements, that he became a millionaire in a very few years. From the exertions of himself and associates grew the Standard Oil Trust, beginning with a capital of £200,000 in 1870, and extending at such a rate that in 1892 the capital had reached twenty-two millions sterling. During his life-time he gave some 750 million dollars to education and charity.

Rodin, Auguste (1841–1917), the most celebrated French sculptor of recent days, who possessed a bold and original genius. His numerous statues and his fine historic monuments, especially that for Calais commemorating the bravery of Eustache de Saint-Pierre, brought Rodin well-deserved fame.

Rodney, 1st Baron, K.B. (1719–92), a famous English admiral who, having gained numerous victories, routed the French fleet under the Comte de Grasse, whom he took prisoner, the result of this crowning success being the Peace of Versailles, 1783.

Rogers, William Penn Adair ("Will") (1879–1935) was America's foremost humorist and a famous stage and film star; was killed with Wiley Post on a holiday flight to Alaska Aug. 15, 1935.

Roland de la Platière, Madame Manou Jeanne (1754–93), was one of the leading figures of the French Revolution. Her husband, **Jean Marie Roland de la Platière** (1734–93), who was one of the Ministers during the Girondist period, escaped from Paris on the disruption of his Party, but his wife remained behind, and was sent to the guillotine. During her incarceration she wrote an *Appeal to Posterity*, remarkable for its beauty of sentiment and patriotic enthusiasm. Her husband committed suicide on receiving the news of her execution.

Rolland, Romain (1866–1944), an eminent French author whose finest work, *Jean-Christophe*, in ten vols., gained him the Nobel Prize for Literature, 1915.

Romilly, Sir Samuel, K.C. (1757–1818), a famous English lawyer who was Solicitor-General in 1806 and for many years had a distinguished career both in Parliament and at the Bar. He effected many improvements in the Criminal Law.

Rommel, Field-Marshal Erwin (1891–1944), was probably the ablest German general engaged in the second world war. His conduct of the war during the North African campaign won high praise and brought the redoubtable Afrika Corps nearly to Alexandria. He was also engaged in the campaigns in Western Europe in 1940 and 1944.

Romney, George (1734–1802), was born in North Lancashire, studied portrait painting with a Kendal artist, and for a few years obtained a living by local portrait painting. Going to London in 1762, his talent gained him speedy recognition; and after studying for a couple of years in Rome, he set up as a portrait-painter in Cavendish Square, and became highly successful. His portraits are among the finest examples of that kind of art that England has produced, and to-day realise large prices.

Röntgen, Professor Wilhelm Konrad (1845–1923), the eminent German scientist who discovered the Röntgen rays in 1895. He made other important laboratory investigations, resulting in the solution of difficult chemical problems.

Roosevelt, President Franklin Delano (1882–1945), great American statesman. Was Assistant Secretary to the Navy under Wilson and unsuccessful Democratic candidate for the vice-presidency in 1920. In 1921 was stricken with infantile paralysis, but recovered sufficiently to re-enter public life and become Governor of New York in 1929. From 1933 until his death served as President of the U.S.A., being the first American to be elected for more than two terms. His New Deal programme (see Gen. Information Section) was outstanding in his domestic policy. His "good neighbor" attitude towards the other American countries, his hamstrung efforts to restrain Axis aggression in the 1930s, his inspired and generous adoption of Lend-Lease, his war-time meetings with Churchill and Stalin, and his energetic prosecution of the war after Pearl Harbour, were the more important features of his foreign policy. His "fireside" talks on the radio brought him into close contact with the American people and his passing in the hour of victory was mourned all over the world. In 1905 married his distant cousin, **Eleanor Roosevelt** (1884–1962), who became known on her own account as a sociologist and newspaper columnist. She became Chairman of the U.N. Human Rights Commission in 1947.

Roosevelt, Theodore (1858–1919), Republican President of the U.S.A., 1901–9, and unsuccessful third party candidate in 1912 following a dispute with Taft. His daring exploits in the Spanish-American war won him wide popularity and he was elected vice-president in 1900 becoming president on McKinley's assassination. For his efforts in promoting peace, notably between Russia and Japan, was awarded the Nobel Prize in 1906. The great struggle with the Trusts marked his years of office.

Rops, Félicien (1833–98), Belgian artist, famous for drawings, etchings, and illustrations. His work is highly original, spirited, humorous and a valued commentary on the life at the time. Was an engraver of magnificent technical skill and a painter of merit.

Ross, Sir James Clark, F.R.S. (1800–62), most experienced polar explorer of the century. He accompanied his uncle, Sir John Ross, and Captain Parry on their expeditions. In the *Victory* commanded by his uncle he located the north magnetic pole in 1831. He commanded the expedition of the *Erebus* and the *Terror* to the antarctic (1839–43), discovering Victoria Land, Mounts Erebus and Terror, and the Ross ice barrier.

Ross, Rear Admiral Sir John, K.C.B. (1777–1856), the eminent explorer who made several voyages to the arctic and searched for the North-west Passage. He discovered Boothnia peninsula, and his nephew reached the magnetic pole.

Ross, Colonel Sir Ronald, K.C.B., K.C.M.G., F.R.S. (1857–1932), professor of tropical sanitation and a leading authority on tropical diseases generally, was for many years in the Indian Medical Service, and was awarded the Nobel Prize for Medicine in 1902. Discovered the malaria parasite.

Rossetti, Dante Gabriel (1828–82), was the son of Gabriele Rossetti (1783–1852), an exiled Italian author who settled in London in 1824. Dante showed great talent as a painter from boyhood and became one of the Pre-Raphaelite Brotherhood, formed in 1848. He also distinguished himself as a poet. His sister, **Christina Georgina Rossetti** (1830–94) was also noted as a poet.

Rossini, Gioacchino Antonio (1792–1868), Italian operatic composer. His first opera *Tancredi* was produced at Venice when he was 21, and between 1816 and 1823 he wrote 21 operas, including *Il Barbiere di Seviglia*, *La Cenerentola*, *Otello*, *La Donna del Lago*, and *Semiramide*. After writing *Guillaume Tell* in 1829, which was hailed as his masterpiece, he gave up composing, producing only a *Stabat Mater* (1832–41) and a mass (1864). *See* **Section E.**

Rostand, Edmond Eugene Alexis (1868–1918), French dramatist whose *Cyrano de Bergerac* created a sensation in 1898.

Rothenstein, Sir William (1872–1945), English painter and writer. Prof. of Civic Art in Sheffield University, 1917–26; Principal of Royal College of Art, 1920–35; Trustee, Tate Gallery, 1927–33. His son, **Sir John Rothenstein** (b. 1901), was until 1964 Director of the Tate Gallery and is now Rector of St. Andrews University.

Rothschild, Anselm Meyer (1743–1812), the founder of the famous financial family was born at Frankfurt-on-Main. After some experience in a bank as clerk, set up for himself first as a moneylender, then as a banker and displaying a genius for finance acquired a large fortune. His son, **Nathan Meyer Rothschild** (1777–1836), took charge of the London house, and conducted its affairs with great success, and was made an Austrian Baron in 1822. He was succeeded by his eldest son, **Baron Lionel de Rothschild** (1808–1879), who was the first Jewish member of the House of Commons.

Roubillac, Louis François (1695–1762), a French sculptor who contributed many monuments to Westminster Abbey.

Rouget de Lisle, Claude Joseph (1760–1836), a French poet who was the author of the words and the music of the *Marseillaise*, the revolutionary song and national anthem of France.

Rousseau, Jean-Jacques (1712–78), French philosopher, political writer, and composer. He was born at Geneva, and after a hard and wandering life made the acquaintance of Madame de Warens, who became his patroness and with whom he resided during the years 1731–41. He then proceeded to Paris, where he made the acquaintance of Diderot, to whose *Encyclopédie* he contributed the musical section. With the production of his pastoral melodrama *Le Devin du village* in 1722 he appeared as a successful composer. Meanwhile he had been studying social questions with great ardour, and in 1761 published his novel *Julie, ou la Nouvelle Héloïse*, which was followed in 1762 by *Emile*, a treatise on education in novel form. These two works contained so much that was at variance with convention, and so opposed to all ideas of moral restraint, that they called forth the condemnation of the orthodox, and Rousseau was obliged to leave France for a time. It was while in England that he wrote his remarkable *Confessions*, and his celebrated *Le Contrat Social*. He laid down principles of government and conduct which bore fruit in the French Revolution. (*See also* **Education, Section J.**)

Rubens, Sir Peter Paul (1577–1640), one of the most notable of Flemish painters. In 1629 he painted for Charles I., who knighted him. His *Adoration of the Magi* was sold in 1959 for the record price of £275,000.

Rubinstein, Anton Grigorovich (1829–94), a famous Russian pianist and composer and founder of the Conservatory St. Petersburg (now Leningrad). His brother Nicholas (1835–81), also a pianist, founded the Conservatory of Moscow.

Rupert, Prince (1619–82), the brilliant Royalist cavalry general opposing Cromwell and a distinguished admiral in the Dutch wars. He was also an early mezzotinter, an experimental scientist, and the first governor of Hudson's Bay Company.

Rusk, Dean, M.A., LL.D. (b. 1909), U.S. Secretary of State in the Democratic Administrations of Kennedy and Johnson, 1961–; Pres. The Rockefeller Foundation, 1952–60. Former Rhodes scholar at St. John's Coll., Oxford.

uskin, John (1819–1900), writer and art critic, the son of a wealthy London wine merchant. His *Modern Painters* exhibited a masterly perception of the principles of art and a boundless gift of literary expression. Other volumes appeared at intervals including *The Seven Lamps of Architecture* and *The Stones of Venice*, two memorable works which considerably enhanced the author's fame. His writings undoubtedly hastened the recognition of Turner and the Pre-Raphaelite painters. Always taking a deep interest in economic questions, Ruskin delivered and published numerous lectures on a wide range of subjects—art, pleasure, religion, war, work, and so forth; and he was acknowledged to be one of the greatest thinkers of the time. Often his views were impracticable and even eccentric, but behind them there was always evident a sincere desire to promote the well-being of the people.

ssell, Bertrand (Arthur William) 3rd Earl, O.M., F.R.S., M.A. (b. 1872), great English philosopher and mathematician, whose vigorous and sceptical writings have profoundly influenced present-day thought. He writes and speaks in a clear, witty, and elegant style and regards the task of the philosopher as one of clarification rather than speculation. In recent years Lord Russell has been actively engaged in the campaign against nuclear warfare. His numerous writings include books on mathematics, philosophy, and ethics, besides works on political and sociological subjects: *The Principles of Mathematics* (1903), *Principia Mathematica* (1910), written in collaboration with A. N. Whitehead, *Problems of Philosophy* (1911), *Marriage and Morals* (1929), *History of Western Philosophy* (1945), *Human Knowledge* (1948), *Commonsense and Nuclear Warfare* (1959). The first volume of his *Autobiography* was published in 1967. Nobel Prize for Literature, 1950.

ssell, George William (1867–1935), Irish poet generally known by his pen name of A.E. or Æ. Widely known as a leader in co-operative enterprise and a pioneer of Abbey Theatre, Dublin.

ssell, John, 1st Earl, K.G., P.C. (1792–1878), third son of the 6th Duke of Bedford. Entered Parliament as Lord John Russell on attaining his majority, and, ranging himself on the Liberal side, showed great capacity for affairs. Introduced first great measure of Reform, which was passed in 1832. Held several offices before succeeding Peel as Prime Minister in 1846. Remained in power until 1852, and was again Prime Minister from 1865 to 1866, resigning when he failed to carry a further reform bill. He also wrote lives of Thomas Moore and Charles James Fox.

ssell of Killowen, Baron, P.C., G.C.M.G. (1832–1900), Lord Chief Justice of England 1894–98. Was one of the greatest British judges and advocates of the 19th century.

therford, Lord, O.M., F.R.S. (1871–1937), of New Zealand birth. Physicist, pre-eminent in the field of atomic research. Conducted his experiments at Montreal, Manchester, and at the famous Cavendish Laboratory at Cambridge, which attracted brilliant young scientists from all over the world. In 1911 announced his nuclear theory of the atom, and in 1918 succeeded in splitting the atom for the first time. His work paved the way for future nuclear research.

ysdael, Jacob van (*c.* 1628–82), great Dutch landscape painter, some of whose pictures are in the National Gallery.

yter, Admiral Michiel Adriaanzoon de (1607–76), the Dutch admiral who in 1667 invaded England with a fleet of Dutch war vessels, advancing up the Thames and Medway and setting fire to considerable shipping. He soon saw fit to retreat, and more serious trouble was averted.

S

hs, Hans (1494–1576), the German shoemaker-poet of Reformation times, was an earnest worker in the Protestant cause, and wrote over 5,000 different pieces, poetry and prose.

i, or Saadi (Muslih-Uddin) (*c.* 1184–1292), the Persian poet who flourished in the 13th century, and won national fame by his poems *The Garden of Roses* and *The Orchard*.

nte-Beuve, Charles Augustin (1804–69), French critic, and one of the most accomplished men of letters under the Second Empire. Author of *Causeries du lundi* and *Histoire de Port Royal*.

Saint-Just, Antoine (1767–94), one of the later leaders of the French Revolution closely associated with Robespierre.

St.-Laurent, Rt. Hon. Louis Stephen, Q.C. (b. 1882). Prime Minister of Canada, 1948–57.

Saint-Saëns, Charles Camille (1835–1921), French composer. His compositions have a classical style and elegance and include symphonic and chamber music and the opera *Samson et Dalila*, which was produced by Liszt at Weimar in 1877.

Saint-Simon, Claude, Comte de (1760–1825), a French scientist and socialist who had great influence upon the thought of his time.

Saintsbury, George Edward Bateman (1845–1933). Professor of Rhetoric and English Literature, Edinburgh University, 1895–1915. Author of numerous critical works on literary subjects, on which he was a leading authority.

Sala, George Augustus Henry (1828–95), journalist of high literary merit who contributed to *Household Words*, the *Illustrated London News*, and the London *Daily Telegraph* (foreign correspondent in all parts of the world).

Saladin (1137–93), the great Sultan of Egypt and Syria who led the Moslems against the Christians in the Third Crusade. In 1187 he had driven the Christians from Jerusalem after a brilliant victory at Hattin near Tiberias. This gave rise to the Third Crusade led by the Emperor Frederick I., Philip II. of France, and Richard I. of England, which achieved little. Besides being a great warrior, Saladin was a wise and cultured man, renowned for his chivalry.

Salazar, Antonio d'Oliveira (b. 1889), Prime Minister and virtual dictator of Portugal since 1932 and responsible for drafting the Portuguese constitution of 1933. Foreign Minister, 1936–47.

Salda, František (1867–1937), Czech critic, essayist, and poet whose influence on Czech thought has been profound.

Salimbene de Adamo (1221–*c.* 1288), mediæval chronicler whose vivid description of life in the 13th century is embodied in his *Cronica*.

Salisbury, Robert Arthur Talbot Gascoyne Cecil, 3rd Marquess of, K.G. (1830–1903), led the Conservative Governments of 1885–86, 1886–92, and 1895–1902. Has been considered one of the best Foreign Secretaries England has ever had, holding the office from 1878 to 1880, when he attended the Congress of Berlin, and for much of his premiership. Retired from political life after peace was declared in South Africa. His grandson, **Robert Arthur James Gascoyne-Cecil, 5th Marquess of Salisbury, K.G.** (b. 1893), was Leader of the House of Lords, 1942–45 and again 1951–57 when he resigned from the Government over its Cyprus policy. As Viscount Cranborne served as Sec. of State for the Dominions and for the Colonies.

Samuel, 1st Viscount, P.C., O.M., G.C.B., G.B.E. (1870–1963), Liberal statesman, High Commissioner for Palestine, 1920–22; Postmaster-General, 1910–14, and again May to Dec. 1915; Home Secretary, 1916, and again 1931–32. M.P. for Cleveland Division (N. Riding, Yorks), 1902–18, and Darwen Div. of Lancs., 1929–35. Chancellor of the Duchy of Lancaster, 1909–10 and 1915–16. Leader of the Liberal Party in the Commons, 1931–35, in the Lords, 1941–55.

Sand, George (1804–76) the leading French authoress of her time—proper name, Armandine Lucile Aurore Dupin, baronne Dudevant—who, both as novelist and dramatist, achieved the highest success. A friend of men of such singular power as Alfred de Musset, Chopin and Sandeau.

Sandow, (Frederick William) Eugene (1867–1925), German "strong man"; overcame his early physical weakness to become a powerfully built man; adviser on physical culture to King George V.

Sanger, Frederick, B.A., Ph.D., F.R.S. (b. 1918), British scientist; Prof. of Biochemistry, Cambridge. Awarded 1958 Nobel Prize for Chemistry for his work in determining the chemical structure of the protein insulin.

Sankey, Ira David (1840–1908), the celebrated American evangelist, singer, and composer, associated with Dwight L. Moody, the revivalist (1837–1899) in mission-work.

San Martín, General José de (1778–1850), the principal figure in the liberation from Spanish rule of three countries: his native Argentina, Chile, and Peru.

Santayana, George (1863–1952), philosopher and poet, born in Madrid of Spanish parentage. He was Professor of Philosophy at Harvard University (where he graduated in 1886) from 1907–12, when he moved to France and thereafter spent his time wandering from country to country. His books include *The Life of Reason* (1905–6), the four volumes of *Realms of Being* (1923–40), *Persons and Places* (1945), and *The Middle Span* (1948).

Santos-Dumont, Alberto (1873–1932), Brazilian aeronaut, his most notable flights being made in Paris, and at Monte Carlo. He visited London in 1903.

Sappho of Lesbos (fl. early 6th cent. B.C.), famous lyric poetess of ancient Greece, of whose love poems only a few fragments remain.

Sardou, Victorien (1831–1908), French dramatist who had a long series of successes—*Nos Intimes*, *Séraphine*, *Rabagas*, *Divorçons*, *Fédora*, *Théodora*, *Patrie*, *La Tosca*, *Madame Sans-Gêne*, *Robespierre*, and *Dante*, the last-named written specially for Sir Henry Irving. He was elected to the French Academy in 1877.

Sargent, Sir Harold Malcolm Watts, A.R.C.O., F.R.C.M., F.R.S.A. (b. 1895), one of the best known modern British conductors. Succeeded Sir Adrian Boult as permanent conductor of the B.B.C. Symphony Orchestra, 1950–57.

Sargent, John Singer, R.A. (1856–1922). American painter, born in Florence, educated in Germany and Italy, noted for his portraits of celebrities.

Sartre, Jean-Paul (b. 1905), French existentialist philosopher, left-wing intellectual, dramatist, essayist and novelist. Captured by the Germans in 1940, he was released on medical grounds the following year and joined the resistance movement. His major philosophical work is *L'Etre et le Néant* and his plays include *Les Mouches*, *Huis Clos*, *Crime passionnel*, *La Putain respectueuse*, and *Les Séquestrés d'Altona*. The first volume of his autobiography, *Les Mots*, was published in 1964. He was awarded (though he declined it) the 1964 Nobel Prize for Literature. *See* **Modern Drama**.

Sassoon, Siegfried (**Lorraine**), C.B.E. (b. 1886), English poet and writer who received the Hawthornden Prize, 1929, for *The Memoirs of a Fox-hunting Man*.

Savonarola, Girolamo (1452–98), Florentine preacher and reformer, a Dominican friar, who denounced vice and corruption not only in society but also in the Church itself, especially attacking Pope Alexander VI. He was excommunicated, imprisoned, and with two of his companions hanged in public. His passion for reform made him impatient of opposition and incapable of compromise. He understood men's hearts but not their limitations. Yet he was a noble figure rightly commanding the respect of later ages. George Eliot's historical romance *Romola* gives a fine portrait of Savonarola.

Sayce, Prof. Archibald Henry, D.Litt., LL.D., D.D. (1845–1933), a distinguished Assyriologist and philologist who was Prof. of Assyriology at Oxford University, 1891–1919. His most important works are *Introduction to the Science of Language*, 1879, *Ancient Empires of the East*, 1884, *The Principles of Comparative Philology*, 1874, and *Egypt and Babylonian Religion*, 1903.

Scarlatti, Alessandro (1659–1725), Italian musician whose influence on the history of opera has been great, founded the Neapolitan school. He composed over 100 operas, 200 masses, and over 700 cantatas and oratorios. His son **Domenico** (1685–1757) was a harpsichord virtuoso and his work has had an important influence in the evolution of the sonata. The chief years of his life were spent at the Spanish Court in Madrid.

Schiaparelli, Giovanni Virginio (1835–1910), famous Italian astronomer who was Director of the Milan Observatory, 1862–1900, and did valuable work on meteors and double stars, but is best known for his discovery of so-called canals on Mars.

Schiller, Johan Christolph Friedrich (1759–1805), the famous German dramatist and poet. Was born at Marbach in Württemberg. Educated at the military Academy at Stuttgart, and intended for a soldier, he evinced an irresistible desire for literary fame, and in 1782 had his first play, *The Robbers*, successfully produced at the Mannheim Theatre, to which he was subsequently appointed dramatic composer. Later he went to Dresden, where he completed his *Don Carlos*; from 1789 to 1793 he held the chair of history at Jena Univ. when he wrote his *History of the Thirty Years' War*, and gained the friendship of Goethe, at whose suggestion he removed to Weimar, and during the next ten years produced his greatest works—*Wallenstein*, *Mary Stuart*, *The Maid of Orleans*, and *William Tell*.

Schlegel, August Wilhelm von (1767–1845), German poet and scholar, best known for his translations of Shakespeare (which established Shakespeare in Germany), Dante, Calderón, and Camões. His *Lectures on Dramatic Art and Literature* are outstanding for their scholarship.

Schliemann, Heinrich (1822–90), German archæologist who made many notable excavations, discovered Troy and other Homeric sites.

Schnabel, Artur (1882–1951), American pianist of Austrian birth, regarded as the greatest exponent of Beethoven's pianoforte sonatas.

Schoenberg, Arnold (1874–1951), Austrian composer who in 1933 was dismissed from his post as head of the Prussian Academy of Fine Arts because of his Jewish ancestry. He went to the United States, teaching first at Boston and then at Los Angeles. Among his works are the choral orchestral *Gurre-Lieder* and *Pierrot Lunaire*, a cycle of 21 poems for voice and chamber music. *See* **Section E**.

Schopenhauer, Arthur (1788–1860), German philosopher of a pessimistic cast of mind, a great admirer of Plato and Heraclitus. Regarded his contemporary Hegel as a charlatan. His chief works are *The World Considered as Will and Idea* and *The Two Fundamental Problems of Ethics*.

Schreiner, Olive, pen name of Mrs. Cronwright Schreiner (1855–1920), a noted South African novelist, born in Basutoland. She first attracted attention with her *Story of an African Farm* (1883). She excelled in depicting veldt scenery and Dutch character.

Schubert, Franz Peter (1797–1828), Austrian composer, born in Vienna, the son of a schoolmaster. He was a contemporary of Beethoven and wrote not only symphonies, sonatas, string quartets, choral music, and Masses but also over 600 songs of unsurpassed lyrical beauty. It is as creator of the German *Lied* that his name is immortal. He died in Vienna at the age of 31, in poverty, before the full flowering of his musical genius.

Schumann, Robert Alexander (1810–56), composer of the early 19th-century German Romantic school. He wrote much chamber music, four symphonies, a piano concerto, and choral music, but it is his early piano pieces and songs that give constant delight. His wife **Clara** (1819–96) was one of the outstanding pianists of her time, especially as interpreter of Chopin.

Schweitzer, Albert, D.Theol., Dr. Phil., Dr. Med. (1875–1965), famous medical missionary in Lambaréné, remembered for his reverence for life. A musical critic and authority on Bach's music, a famous organist, and a noted biblical critic he became a Doctor of Medicine in order to devote his life to missionary work in Equatorial Africa. Awarded 1952 Nobel Prize for Peace and Hon. O.M. in 1955.

Scipio, Publius Cornelius (*circa* 232–183 B.C.), the greatest of the Scipios known as Scipio Africanus the elder. A distinguished Roman general in the 2nd Punic War.

Scott, Charles Prestwich (1846–1931), English journalist who was editor of the *Manchester Guardian*, 1872–1929, which under his editorship became one of the leading journals of the country.

Scott, Sir George Gilbert, R.A. (1811–78), architect who gained special fame for his restorations of Gothic churches and cathedrals, incl. Westminster Abbey, designer of the Albert Memorial, St. Pancras Station, the Martyrs' Memorial at Oxford, and St. Anne's Church in Alderney.

Scott, Sir Giles Gilbert, O.M., R.A., F.R.I.B.A. (1880–1960), architect whose work includes the great modern Gothic Liverpool Cathedral, the Bodleian Library, Oxford, and the Forth Road Bridge (opened 1964). Grandson of the above.

Scott, Peter Markham, M.B.E., D.S.C. (b. 1909), son of Captain Scott, is known as yachtsman, broadcaster, and bird-artist.

tt, Captain Robert Falcon, C.V.O. (1868–1912), ommanded the National Antarctic Expeditions n 1901–4 and in 1910. His ship, the *Terra Nova*, eft England on June 1, 1910. In Jan. 1911, winter quarters were established at Cape Evans, and in the following November Scott and a select party left Hut Point for the South Pole, which they reached on Jan. 18, 1912, inding there the Amundsen records. On the eturn journey every member of the party perished. Leading-seaman Edgar Evans died rom concussion of the brain on Feb. 17; Capt. Oates from exposure on March 17; and on March 29 the rest of the party (Scott, Wilson and Bowers) died from starvation and exposure in a blizzard when only 11 miles from One Ton Depot.

tt, Sir Walter, Bart. (1771–1832), one of the greatest of British novelists and a distinguished poet. He was educated for the Bar. His *Minstrelsy of the Scottish Border* was published in 1802. This was followed in 1805 by *The Lay of he Last Minstrel*, in 1808 by *Marmion; The Lady of the Lake*, *Rokeby* and *The Lord of the Isles* coming afterwards in quick succession. In 1814 he published *Waverley* anonymously, which obtained instant success. Other stories followed and the Waverley novels and their uthor, "The great Unknown," were everywhere the subject of discussion. *Guy Mannering*, *The Antiquary*, *Old Mortality*, *Rob Roy*, and the *Heart of Midlothian* were all published before he secret of their authorship was disclosed. The chief works of his last years were *Woodstock*, *Life of Napoleon*, and *Tales of a Grandfather*. He died at Abbotsford. Created a baronet in 1820.

tt-Paine, Hubert (1891–1954), pioneer in the design and construction of aircraft and sea craft.

iabin, Alexander (1872–1915), Russian composer and pianist. He studied at the Moscow conservatoire, where he was later professor of he pianoforte, 1898–1904. He was deeply interested in theosophy, and in such works as *The Divine Poem*, and *Prometheus: a Poem of Fire* he attempted to unite music and philosophy

ley, Sir John Robert, K.C.M.G. (1834–95), English historian and author of *Ecce Homo*.

ovia, Andrés (b. 1894), Spanish concert-guitarist. He has adapted works by Bach, Haydn, Mozart, and other classical composers o the guitar.

fridge, Harry Gordon (1858–1947), the American who revolutionised the British department store when he opened the famous shop of Selfridges in Oxford Street in 1909.

nmelweis, Ignaz Philipp (1818–65), Hungarian physician, a pioneer in employing antiseptic methods in obstetric cases, having discovered hat puerperal fever is an infection caused by erms. It was then the practice of doctors in maternity wards to examine expectant mothers with unwashed hands.

eca, Lucius Annaeus (*circa* 4 B.C.–A.D. 56), the amous stoic philosopher, who was tutor to Nero, and one of that emperor's most influential dvisers; he was sentenced to end his own life, sentence which he courageously carried out.

efelder, Alois (1772–1834), was the son of an ctor at Munich, and himself engaged in ramatic composition. Being too poor to bear he cost of having his works printed, he turned is attention to inventing lithography, the main eature of the invention being discovered by ccident.

erus, Lucius Septimius (146–211), was Roman Emperor from 193 to his death. After many ictories in the East he passed over to Britain with an army, subjugated the Caledonians, and epaired and partly rebuilt the famous Hadrian's wall from the Solway Firth to the mouth of the Tyne. He died at York.

igné, Marie de Rabutin-Chantal, Marquise de (1626–96), French woman of letters. Her letters to her daughter Françoise written in an unaffected elegance of style give a moving picture f fashionable society in 17th-century France.

mbati, Giovanni (1841–1914), Italian pianist nd composer who revived interest in classical nstrumental music in an age of opera. Well nown is his quartet in D flat.

ckleton, Sir Ernest (Henry), C.V.O., O.B.E. 874–1922), commander of the Nimrod Farthest outh expedition of 1907–9, reached within 100 niles of the South Pole, and embarked on a new expedition in 1914. He died whilst on a scientific voyage to the Antarctic.

Shaftesbury, Anthony Ashley Cooper, 7th Earl of (1801–85), great social reformer, largely responsible for the legislation reducing the misery of the industrial revolution. He agitated for the abolition of slavery and was connected with the Ragged School Union, reformatories, refuges, and Christian associations of many kinds.

Shakespeare, William (1564–1616), England's greatest poet and dramatist, was born at Stratford-on-Avon, and was the son of a tradesman of that town who must have been at one time fairly well-off, seeing that he was made an alderman, and afterwards served as High Bailiff. Later on, however, he appears to have been unfortunate and fallen into straitened circumstances. William was the eldest son, and was probably educated at the Stratford Grammar School, but very little is known of his career up to his eighteenth year, when we have it on record that he married Anne Hathaway, who was eight years his senior. Five years after his marriage he went to London, and the next we hear of him is that he was connected with the Globe Theatre and appeared in sundry small parts. He first appeared before the public as a poet in 1593, with his *Venus and Adonis*, following this in 1594 with *The Rape of Lucrece*. Shortly afterwards he was proprietor of the Globe Theatre, and also had an interest in the Blackfriars Theatre. Then he began that remarkable career of play-writing which has since been the wonder of the world. Thirty-eight plays comprise the Shakespeare canon. Thirty-six were printed in the First Folio of 1623 (the first collected edition of his dramatic works), of which eighteen had been published during his lifetime in the so-called Quartos. *Love's Labour's Lost* and *The Comedy of Errors* seem to have been among the earliest, being followed by *The Two Gentlemen of Verona*, and *Romeo and Juliet*. Then followed *Henry VI*, *Richard III*, *Richard II*, *Titus Andronicus*, *The Taming of the Shrew*, *King John*, *The Merchant of Venice*, *A Midsummer Night's Dream*, *All's Well that Ends Well*, *Henry IV*, *The Merry Wives of Windsor*, *Henry V*, *Much Ado about Nothing*, *As You Like It*, *Twelfth Night*. Then came some of his greatest plays, *Julius Cæsar*, *Hamlet*, *Troilus and Cressida*, *Othello*, *Measure for Measure*, *Macbeth*, *King Lear*, *Timon of Athens*, *Pericles*, *Antony and Cleopatra*, *Coriolanus*, *Cymbeline*, *A Winter's Tale*, *The Tempest*, *Henry VIII*, and *The Two Noble Kinsmen*. He was able to purchase property at Stratford, and when he retired from his profession (about 1610 or 1612) he returned to his native town to live in a house which he had himself built. He was buried in Stratford Church.

Sharp, Granville (1735–1813), slavery abolitionist and founder of the colony of Sierra Leone.

Shastri, Shri Lal Bahadur (1904–66), Indian politician who became Prime Minister of India after the death of Nehru in 1964. He died of a heart attack at the end of the Soviet-sponsored Tashkent talks. *See also* Section C. Part I.

Shaw, George Bernard (1856–1950), brilliant Irish dramatist who conquered England by his pungent wit and devastating exposure of hypocrisy, cant and national weaknesses, and persistently expressed a highly individual opinion whether in his musical criticisms, socialist pamphlets or plays. He wrote many plays including *Man and Superman*, *Heartbreak House*, *Back to Methuselah*, *Saint Joan*, *The Apple Cart*, *Buoyant Billions*, most of which have important prefaces, sometimes equalling the play in length. Was music critic (1888–94) successively to the London *Star* and *World* and during this period wrote *The Quintessence of Ibsenism* and *The Perfect Wagnerite*. Joined the Fabian Society in 1884 and was awarded Nobel Prize for Literature in 1925. He was greatly interested in the reform of the alphabet.

Shelley, Percy Bysshe (1792–1822), one of the most brilliant poetic geniuses of the 19th century, renowned for the daring and unorthodox opinions which he held. His *Queen Mab* (written when he was nineteen), his *Alastor*, *The Revolt of Islam*, *The Witch of Atlas*, and *Adonais* all breathe the true spirit of poetry.

securing him a place in the first rank of British poets. He showed fine dramatic gifts in the *Cenci* and *Prometheus Unbound*, almost reaching sublimity in the latter masterpiece. His *Adonais* was a splendid tribute to the genius of Keats. His first wife, whom he married while very young, committed suicide. He afterwards married Mary Wollstonecraft Godwin, and formed other attachments of a complicating nature. Was always at war with his family, and finally, after spending some time with Byron and Leigh Hunt and other friends in various parts of Italy, was drowned in the Gulf of Spezia by the capsizing of his boat in a storm.

Sheppard, Very Rev. Hugh Richard Lawrie (Dick), C.H., D.D. (1880–1937), Vicar of St. Martin-in-the-Fields, London, 1914–27, where he established a reputation by his broadcast sermons and attracted large crowds of listeners. Dean of Canterbury, 1929–31; Canon of St. Paul's, 1934–37. Buried in Canterbury Cathedral.

Sheraton, Thomas (1751–1806), was the last of the great English furniture designers of the 18th cent. There is no evidence that he was a maker of furniture; his reputation rests solely on his published works which helped to create a certain trend or style, notably the *Cabinet-Makers' and Upholsterers' Drawing Book* (1791–94).

Sheridan, Rt. Hon. Richard Brinsley Butler (1751–1816), one of the greatest of English playwrights, whose comedies are frequently revived. Was born in Dublin, and educated partly at Harrow. Showing considerable capacity for dramatic composition he obtained an introduction to the Covent Garden management, and it was at the Covent Garden Theatre in 1775 that his first comedy, *The Rivals*, was produced, with such a gratifying result that Garrick, who was then at Drury Lane, opened up negotiations with the dramatist which ended in Sheridan becoming part (and ultimately sole) proprietor of Drury Lane. *The Duenna*, a musical comedy, was produced in 1775, and ran through the winter. From 1777 Sheridan managed Drury Lane, opening with an adaptation of Vanbrugh's *Relapse*. This was followed by the production of the greatest of his comedies, *The School for Scandal*, which had a wonderful success. In 1779 *The Critic* was given, and after that Sheridan wrote no more plays until 1789, when *Pizarro* was produced. In the meantime he had gained a high reputation in another sphere. In 1780 he obtained a seat in Parliament and although he only spoke on certain set occasions, he acquired a reputation for oratory which stood him in very good stead, and he filled one or two minor Ministerial offices, remaining in Parliament until 1812.

Sherman, General William Tecumseh (1820–91), a famous American soldier who, after taking part in the War with Mexico (1846–48), volunteered at the outbreak of the Civil War (1861). He took part in the battles of Bull Run and Shiloh, and was placed in command of the Army of the Tennessee (1863) and of the military division of the Mississippi with a force of 100,000. In 1864 there occurred the famous 300-mile march across Georgia to the sea. In 1865 his second march, through the Carolinas, culminated in the defeat of Johnston, which led directly to the termination of the war.

Sherrington, Sir Charles Scott, O.M., G.B.E., F.R.S., M.D., D.Sc. (1857–1952), one of the greatest of British scientists, and a leading authority on the physiology of the nervous system, whose research work over many years led to great advances in the surgery of the brain. Pres. of the British Association 1920, and of the Royal Society, 1920–25. Awarded Nobel Prize for Medicine, 1932.

Shirley, James (1596–1666), was an eminent dramatist and poet, imbued with the Elizabethan traditions.

Sholokhov, Mikhail Aleksandrovich (b. 1905), great Russian novelist who won international fame with his novel *And Quiet Flows the Don*. Nobel Prize for Literature, 1965.

Shostakovich, Dmitri (b. 1906), one of the most celebrated of present-day Russian composers. His music is complex, profound, and deeply significant of the Soviet age in which he lives. His works include operas, ballets, symphonies, chamber music, and music for films. Hero c Soviet Labour (1966). *See* **Section E.**

Sibelius, Jean Julian Christian (1865–1957), Finnish composer, generally acknowledged as th greatest of the century. Works include seve symphonies, violin concerto, several tone poems about 200 pianoforte compositions and songs.

Sickert, (Walter) Richard (1860–1942), Britis painter and etcher; became President of Roya Society of British Artists, 1928.

Siddons, Sarah (1755–1831), the greatest of th English tragic actresses, b. at Brecon, Sout Wales, eldest of the famous Kemble family She made her first appearance in London a Drury Lane in 1775 in the part of Portia.

Sidgwick, Henry (1838–1900), Professor of Mora Philosophy at Cambridge, and besides bein an eminent educationist in the broader sens devoted himself with special success to th cause of women's education, Newnham an Girton being largely the outcome of his efforts

Sidney, Sir Philip (1554–86), statesman, poet an soldier; was one of Queen Elizabeth's favourites, and a man of singular ability and bravery While living in temporary retirement he composed his famous *Arcadia*, but did not allo it to be published in his lifetime. He did no lack for literary fame, however, his *Apology fo Poetry* and *Defence of Poesy*, as well as numerou miscellaneous pieces all distinguished for thei beauty of expression and tender sentiment having won much favour, especially in the circl of the Court. In 1586 he was given a comman in the Netherlands and was killed at Zutphen

Siemens, Sir William, F.R.S. (1823–83), a German born scientist and inventor, chiefly in the fiel of heat and electricity. Constructed man overland and submarine telegraphs. Brothe of Werner v. Siemens, founder of the famou firm of Siemens-Halske.

Sienkiewicz, Henryk (1846–1916), famous Polis novelist; Nobel prizewinner, 1905 (*Quo Vadis*)

Sikorski, Wladyslaw (1881–1943), Polish genera and statesman; Prime Minister during secon world war.

Simpson, Sir James Young, Bt., F.R.S. (1811–70) the discoverer of the utility of chloroform as a anæsthetic, was a native of Scotland, and wa a most accomplished experimental surgeon.

Sinclair, Upton (b. 1878), American novelist whos documentary novel *The Jungle* about the Chicag slaughter yards caused a sensation in 1906.

Singer, Isaac Meritt (1811–75), American mechanical engineer who devoted himself to the improvement of the early forms of the sewing machine and patented a single-thread an chain-stitch machine.

Sisley, Alfred (1839–1899), French Impressionis painter of English origin. Painted with great de icacy and sensitivity, landscapes, villages, tree and rivers. Influenced by Corot and Manet.

Sitwell, Edith (Louisa), D.B.E. (1887–1964), English poet whose works include *Bucolic Comedie Gold Coast Customs* and *Collected Poems*. He two brothers are Osbert (b. 1892), a well-know poet and novelist, and Sacheverell (b. 1900), poet and critic. *See also* **M2.**

Slim, Field-Marshal Viscount, K.G., G.C.B G.C.M.G., G.C.V.O., G.B.E., D.S.O., M.C. (b 1891), Gov.-Gen. of Australia 1953–59. In 194 took command of the 14th Army in Burm later becoming commander of the Allied Lan Forces, S.E.A.C., and then Commandant of th Imperial Defence College. Succeeded Lor Montgomery as C.I.G.S., 1948–52. Gov. an Constable Windsor Castle, 1964–.

Sloane, Sir Hans, Bt., F.R.S. (1660–1753), was bor in County Down, Ireland, but settled in Londo and became famed as a physician and naturalis For some years he held the office of President the Royal College of Physicians, and was electe President of the Royal Society in succession Sir Isaac Newton. His Library of 50,000 vols and treasures in natural history and MSS., wor £50,000 to £80,000, were offered by his will the nation and bought for £20,000; with th nucleus the British Museum was founded.

Slowacki, Julius (1809–49), Polish romantic poe He was a revolutionary, lived in exile and died Paris. His tragedies include *Kordian*, *Belladyr* and *Lilli Weneda*.

Smeaton, John (1724–92), who rebuilt Eddystow Lighthouse, which had been burned down;

ubsequently constructed many important works in connection with harbours and canals. He was also the inventor of an improved blowing pparatus for iron-smelting.

etana, Bedřich (1824–84), Czech composer, creator of a national style. He was principal conductor of the Prague National Theatre, for which he wrote most of his operas, including *The Bartered Bride* and *The Kiss.* Best known of his other compositions are the cycle of symphonic poems *My Country* and the string quartets *From My Life.* He became totally deaf in 1874, suffered a mental breakdown, and died in an asylum. *See* Section E.

iles, Dr. Samuel (1812–1904), was in early life a medical practitioner; achieved wide popularity by his *Self Help*, a book that has had an enormous sale.

ith, Adam, F.R.S. (1723–90), the father of the science of political economy. Author of *Theory of Moral Sentiments* and *Wealth of Nations*, which immediately obtained the admiration of the leading men of the day, and secured him the friendship of Gibbons, Hume, Burke, Reynolds, and Dugald Stewart.

ith, Sir Grafton Elliot, M.A., Litt.D., D.Sc., F.R.S. (1871–1937), Australian anatomist and archaeologist who was professor of anatomy at Manchester and London Universities. His works include *The Royal Mummies* (1912), *Tutankhamen* (1923), *The Evolution of Man* (1924), and the *Diffusion of Culture* (1933).

ith, Captain John (1580–1631), the noted seafarer and adventurer who in 1605 was the leading spirit of an expedition to Virginia, and ounded Jamestown.

ith, Joseph (1805–44), founder of Mormonism, on of a Vermont farmer. Claimed to have been ranted revelation of the *Book of Mormon*, which ame to be held as equal in authority and as a necessary supplement to the Scriptures. Smith, who was murdered, was not a polygamist; Brigham Young, who succeeded him, was. *See* Mormonism, Section J.)

ith, Sydney (1771–1845), an Anglican divine, who enjoyed a great reputation as a wit and writer. Founder of and contributor to the *Edinburgh Review* and author of *Peter Plymley's Letters*, supporting Catholic Emancipation.

ith, William (1769–1839), English surveyor and eologist, the first to map the rock strata of England and to identify the fossils peculiar to ach layer.

ith, William Robertson (1846–94), Scottish iblical scholar whose contributions to the 9th dition of *The Encyclopaedia Britannica* resulted n an unsuccessful prosecution for heresy and ed to the modernisation of Scottish theology.

ollett, Tobias George (1721–71), a famous English novelist and humorist, whose *Roderick Random*, *Peregrine Pickle*, *Count Fathom* and *Humphrey Clinker* abound in fun and genial haracterisation, while their pictures of sea-life re inimitable.

uts, Field-Marshal Rt. Hon. Jan Christiaan, O.M., .H., K.C. (1870–1950), South African soldier nd statesman, one of the dominating political gures of our century. Born in Cape Colony, tudied at Cambridge University, and called to he Bar. Was an outstanding Boer commando eader during the South African War, but afterwards worked for friendship with the British and ook office in Botha's Government when the Union was set up in 1910. In the first world war joined the Imperial War Cabinet. As rime Minister, 1919–24, helped to launch the eague of Nations, and later was associated ith the United Nations. Prime Minister, oreign Minister and Minister of Defence from 939 to 1948 when he was defeated at the eneral Election by the Nationalists under Dr. Malan. He was a keen botanist; Pres. of ritish Association, 1931. Published *Holism nd Evolution* in 1926.

th, Dame Ethel Mary (1858–1944), English omposer, the daughter of a general, and a militant suffragette. She studied in Germany, here her most important opera *The Wreckers* as first produced. She also wrote chamber usic, a comic opera *The Boatswain's Mate*, and a *Mass in D.*

ders, Frans (1597–1657), a great Flemish still-life nd animal painter who studied under Breughel.

Soane, Sir John, R.A. (1753–1837), an eminent architect who designed numerous public buildings. By his will he left his museum, library, pictures, etc., for the use of the public, and the house in which he lived at Lincoln's Inn Fields still constitutes the Sir John Soane Museum.

Sobieski, John III. (1624–96), King of Poland from 1674, and heroic defender of his country from Cossacks, Tartars, and Turks.

Socinus, Lælius (1525–62), an Italian Protestant thinker and anti-Trinitarian, founder with his nephew Faustus Socinus (1539–1604), of the Socinian system of theology.

Socrates (470–399 B.C.), Greek philosopher and great intellectual leader, was the son of a sculptor and for some time followed that calling himself, but, having other ambitions, joined the army, and was present at the battle of Potidæa, and also at the battle of Delium, saving the life of Alcibiades in the first, and of Xenophon in the second. Returning to Athens he devoted himself to study and began to exhort the people on public questions and the conduct of life. Socrates wrote nothing himself, but we know of his teachings through the writings of his pupils Xenophon and Plato. In 399 B.C. he was charged with impiety and with corrupting the morals of the young, found guilty, and sentenced to death, events immortalised in Plato's *Apology*, *Crito*, and *Phaedo.*

Soddy, Frederick, M.A., LL.D., F.R.S. (1877–1956), Prof. of Inorganic and Physical Chemistry, Univ. of Oxford, 1919–36. Nobel Laureate in Chemistry 1921. The foundation of the isotope theory was laid by him in Glasgow about 1912 before the physicists became prominent in that field.

Soldatov, Alexander (b. 1917), Soviet diplomat, succeeded J. Malik as ambassador to Britain, 1960.

Solon (638–558 B.C.), was one of the Seven Sages of Greece, and became an eminent legislator, after having made a reputation as a poet. Solon's Laws were so highly esteemed that they were adopted by the Romans in the Twelve Tables.

Solyman (1490–1566), the celebrated Ottoman Sultan known as "the Magnificent," who won fame as a conqueror, law-giver, administrator, and patron of learning.

Somerset, 1st Duke of (1506–52), was Protector of England in the early part of the reign of Edward VI., but was deposed from power, tried for felony, and executed. A liberal and tolerant ruler who opposed enclosures and pursued a moderate religious policy.

Sophocles (495–406 B.C.), the famous Athenian dramatist who enjoyed the highest popularity at Athens, and in a contest with Æschylus was crowned the victor. Of the 100-odd plays of Sophocles only seven have survived: *Antigone*, *Electra*, *Œdipus*, *Ajax*, *Trachiniae*, *Philoctetes*, and *Œdipus at Colonus.*

Soult, Marshal Nicolas Jean de Dieu, Duke of Dalmatia (1769–1851), was one of Napoleon's favourite and most capable generals, distinguishing himself in the Swiss and Italian campaigns, and also in the Peninsular War, where he was Wellington's bravest opponent.

Sousa, John Philip (1854–1932), American bandmaster and composer of numerous stirring marches. His father was Portuguese and his mother German.

Soustelle, Jacques, D. ès. L. (b. 1912), French scientist and controversial figure in French politics. As leader of the U.N.R. (Union for a New Republic) he planned and carried through the revolution which brought General de Gaulle back to power in 1958. Dismissed from Government. Feb. 1960.

Southey, Robert (1774–1843), English poet and historian. In 1803 he settled near Keswick to be near Coleridge and became one of the Lake poets. He was made poet Laureate in 1813. His best work was in prose: histories of Brazil and of the Peninsular War; life of Nelson, and biographies of Wesley and others.

Southwell, Robert (1561–95), a famous Jesuit and religious poet of Elizabethan times. Beatified in 1929.

Spaak, Paul-Henri (b. 1899), Belgian statesman; first President of the U.N. General Assembly in 1946 and of the Assembly of the Council of Europe during its first session in 1949. Sec. Gen. of NATO, 1957–61.

Spaatz, General Carl Andrew (b. 1891), American soldier who held high commands in Europe, North Africa, and the Pacific, 1942–46.

Spartacus, a Thracian who became a Roman slave and gladiator in Capua, and headed an insurrection in Italy in 73 B.C. The slaves he raised routed several Roman armies, but he was eventually defeated by Crassus in 71 B.C. and slain.

Speke, Capt. John Hanning (1827–64), was the discoverer, along with Lt.-Col. J. A. Grant, of the Kagera, the main source of the White Nile, in 1862. In 1856 he discovered Lake Tanganyika and in 1858 Victoria Nyanza.

Spence, Sir Basil, O.M. (b. 1907), architect of the new Coventry cathedral, the new university of Sussex, Glasgow air terminal, Hampstead civic centre, and the new British embassy in Rome. Prof. of Architecture, Royal Academy.

Spencer, Herbert (1820–1903), was the son of a Derby schoolmaster. For some time followed the profession of civil engineer. His first book was published in 1851, under the title of *Social Statics*, when he was filling the position of subeditor of the *Economist*. In 1855 his *Principles of Psychology* appeared, in which he seems to have anticipated Darwin's theory of Evolution. The *System of Synthetic Philosophy* began to appear in 1860, and the last of its ten volumes was issued in 1896.

Spencer, Sir Stanley, C.B.E., R.A. (1891–1959), British artist whose work shows great visionary and spiritual power. His paintings include the Resurrection pictures and the Cookham Regatta series.

Spenser, Edmund (1552–99), was born in London, educated at Cambridge, and early attracted notice by his poetic writings. After the publication of his *Shephearde's Calendar*, he was made known to Queen Elizabeth, and in 1580 received the appointment of Secretary to the Lord Deputy of Ireland, and in the division of confiscated lands that afterwards took place, Spenser received Kilcolman Castle and 3,000 acres of land. Here he wrote his *Faerie Queene*. In 1598 a rebellion broke out, and Spenser's castle was burned to the ground. He then returned to London, and there died.

Spinoza, Baruch or **Benedict** (1632–77), one of the greatest of modern philosophers, was born at Amsterdam, the son of a Portuguese Jew who had settled there as a merchant. He had a sceptical turn of mind and having expounded philosophical doctrines antagonistic to Judaism, was excommunicated by the rabbis as a heretic. He owed much to Descartes and in 1663 published his work on the Cartesian philosophy. The attainment of truth was his one object in life. Indifferent to money, he spent his life in study and earned his living as a lens grinder. His writings have had an extensive and enduring influence though during his lifetime some of his works, including his *Ethics*, were not allowed to be published. *See also* **J20(1).**

Spofforth, Reginald (1770–1827), a writer of glees, including *Hail, Smiling Morn*.

Spurgeon, Rev. Charles Haddon (1834–92), a renowned Baptist who preached at The Tabernacle, near the Elephant and Castle, London, from 1861 until his death.

Staël, Madame de (Anne Louise Germaine Necker, Baronne de Staël-Holstein) (1766–1817), the daughter of Necker, the famous Finance Minister under Louis XVI., was married to Baron de Staël (Swedish Minister) at twenty. She was a brilliant woman, deeply imbued with philosophical sentiments. Two years after her marriage she made a considerable impression by her *Letters on Rousseau*, and was regarded as in sympathy with the Revolution. Later on, however, she was in disfavour, first with the Revolutionary leaders, and then with Napoleon, and was in turn exiled by both and during this time wrote *Corinne* and other able works.

Stalin, Generalissimo Joseph Vissarionovich (Djugashvili) (1879–1953), Soviet statesman who for nearly thirty years was leader of the Russian people. Studied for the priesthood at the Tiflis theological seminary. From the age of 17 was an active revolutionary and took important part in the civil war after 1917. After the death of Lenin became the outstanding figure in Russia and his aim to make Russia a great industrial power was carried into effect by modernizing agriculture on socialist lines and by a series of five-year plans, the first of which was introduced in 1929. Assumed military leadership against the German invasion, June 1941. Attended the Allied war conferences a Teheran, Yalta, and Potsdam. The denunciation of Stalin and the " personality cult " by M. Khrushchev at the Soviet Communist Party Congress in Feb. 1956 led to profound and far-reaching political consequences in Communis countries.

Stanford, Sir Charles Villiers, Mus. D. (1852–1924) Professor of Music at Cambridge University, and Professor of Composition and Orchestral Playing in the Royal College of Music. An organist and conductor of remarkable ability, and a composer of much fine instrumental choral, operatic, and other music.

Stanley, Sir Henry Morton. G.C.B., (1841–1904) British explorer, after an adventurous early career during which he fought for the Confederates in the American Civil War, joined the *New York Herald* as a correspondent in 1867 and was commissioned by Gordon Bennett to search for Livingstone. In 1871 he discovered the great missionary at Ujiji and with him explored the northern end of Lake Tanganyika After further exploration he founded the Congo Free State in 1879. Among his books were *How I found Livingstone*, *Through the Dark Continent* *In Darkest Africa*, and an *Autobiography*.

Steele, Sir Richard (1672–1729), b. in Dublin founder of *The Tatler*, which made a great hit his friend Addison contributing many papers Two years later he and Addison were associated in *The Spectator*, Addison, however, being the leading contributor; the *Guardian* was another of Steele's ventures. He sat in Parliament for some time, and was knighted by George I.

Steer, Philip Wilson, O. M. (1860–1942), was the most distinguished of British landscape painters and a fine portraitist.

Stefansson, Vilhjalmur (b. 1879), a famous Arctic explorer, born in Manitoba of Icelandic parents Took part in the Anglo-American (1908–12) and Canadian (1913–18) Arctic expeditions.

Stein, Sir Aurel, K.C.I.E. (1862–1943), was a famous British archæologist who conducted expeditions, chiefly to Chinese Turkestan, resulting in priceless additions to the British Museum and the Delhi Central Indian Museum. Explored Baluchistan, 1926–28, and South Iran, 1932–33 Was Superintendent of Archæological Survey North-West Frontier Circle, India, 1910–29.

Stendhal, *nom de plume* of the French novelist **Marie Henri Beyle** (1783–1842), who has been an important influence in the development of the French novel and whose books show searching psychological insight. Best known for his two novels, *Le Rouge et le Noir*, and *La Chartreuse de Parme*.

Stephen (1105–54) was King of England from 1135 to his death, usurping the crown that belonged to Matilda, the daughter of Henry I.

Stephen Sir Leslie, K.C.B. (1832–1904), an eminent writer, critic and biographer. Edited the *Cornhill Magazine* (1871–82), and the *Dictionary of National Biography* (1882–91). He was the father of Mrs. Virginia Woolf.

Stephenson, George (1781–1848), was born a Wylam, near Newcastle, and up to 1804 was mainly engaged in ordinary colliery occupations. In 1804, however, an engagement a brakesman at Killingworth colliery brought him in touch with the working of Watt's steam engine, and his first efforts in invention were in improving one of those engines, showing s much ability that he was offered an enginewright's position at Killingham, which he held for some time. Then it was that he began t think seriously of producing a locomotiv engine, and managed to construct an engine that would draw coal trucks at the rate of fou miles an hour. In 1821, when the Stockton and Darlington Railway was undertaken, he was appointed engineer, and when the railway was opened in 1825, as a line for the transpor of coal only, Stephenson won his first grea triumph, by putting a locomotive on the lin that was able to draw a train of thirty-eigh carriages, laden with goods and passengers, a a rate of twelve miles an hour. George Stephenson, subsequently, assisted by his son Robert constructed the Liverpool and Manchester line, and after that the railway era commenced.

ephenson, Robert, F.R.S. (1803–59), the only son of George Stephenson, attained great eminence as a civil engineer, constructing numerous important railways and bridges, being designer and contractor for the High Level Bridge at Newcastle, the Menai and Conway Tubular Bridges, the Victoria Bridge across the St. Lawrence at Montreal, and two notable bridges over the Nile.

erne, Laurence (1713–68), British humourist whose *Tristam Shandy* (1759–67) brought him fame. He also wrote *The Sentimental Journey* and published some volumes of sermons.

evenson, Adlai Ewing (1900–65), American lawyer and politician; Ambassador to U.N., 1960–65; Gov. of Illinois, 1949–53; Democratic candidate for Presidency, 1952 and 1956.

evenson, Robert, F.R.S.E. (1772–1850), a native of Glasgow, famed as a builder of lighthouses, including that on Bell Rock. He invented the "flashing" system of throwing light at sea.

evenson, Robert Louis (1850–94), was the Scottish author of a remarkable series of essays, stories, and poems, including *Travels with a Donkey*, *Virginibus Puerisque*, *Treasure Island*, *Kidnapped*, *Dr. Jekyll and Mr. Hyde*, and *A Child's Garden of Verses*. He always suffered from delicate health and travelled extensively, finally settling in Samoa with his Californian wife, formerly Mrs. Osbourne. His literary influence was considerable, particularly on the generation which followed him.

nnes, Hugo (1870–1924), German industrialist who built up a huge coal-mining, iron and steel, and transport business, and also developed a large shipping concern. His group controlled the greater part of Germany's coal, iron and steel supply. In 1920 he entered the Reichstag, and later became a newspaper proprietor.

rling, Elizabeth (1819–95), English organist whose recitals in London exercised much influence and made Bach's music more widely known. She wrote the part-song "All among the barley."

oker Bram (Abraham) (1847–1912), b. in Ireland, author of *Dracula* and *Personal Reminiscences Of Henry Irving*, which records his association with the actor in managing the Lyceum Theatre.

okes, Sir George Gabriel, L.L.D., F.R.S. (1819–1903), Irish mathematician and physicist; Prof. of Mathematics at Cambridge from 1849; served as Sec. (1854–85) and as Pres. (1885–92) Royal Society, and as Pres. British Association (1869). Renowned for his researches in hydrodynamics and the theory of light.

pes, Marie Carmichael, D.Sc., Ph.D., F.L.S., F.R.L.S. (1880–1958), woman scientist who published many works on birth control.

we, Harriet Elizabeth Beecher (1811–96), authoress of *Uncle Tom's Cabin* which exposed the horrors of slavery and did much to advance the cause of abolition.

achey, Rt. Hon. Evelyn John St. Loe (1901–63), English writer and politician; served in Attlee's cabinet, 1945–51. Author of lucid and vigorous books on the principles of democratic socialism. Son of the journalist John St. Loe Strachey and cousin of Giles Lytton Strachey, the bio-rapher.

adivari, Antonio (1644–1730), an Italian maker f violins, b. Cremona, first in his art.

afford, Thomas Wentworth, Earl of (1593–1641), he distinguished statesman, sent by Charles I. o Ireland as Lord Deputy in 1631. Was the ounder of the Irish linen manufacture. He btained the name of "Thorough" by his weeping measures for asserting the King's uthority, but was ultimately impeached on a ariety of charges, found guilty, and executed.

auss, David Friedrich (1808–74), German theo-ogical writer, who made a great stir in the re-igious world by his *Life of Jesus*, published in 835, which attempted to prove that the evan-elical history rested on a series of myths.

auss. Family of Viennese musicians. **Johann trauss** (1804–49), "the elder," was a composer f dance music who with Joseph Lanner estab-shed the Viennese waltz tradition. His son, **ohann Strauss** (1825–99), "the younger," lthough not so good a violinist or conductor s his father, is the more famous as the composer of over 400 waltzes, which include *The Blue Danube* and *Tales from the Vienna Woods*. Two of his brothers **Joseph Strauss** (1827–70) and **Eduard Strauss** (1835–1916) were also composers and conductors.

Strauss, Richard (1864–1949), German composer and conductor, the son of a horn player in the opera orchestra at Munich. He succeeded von Bülow as court musical director at Meiningen. Among his compositions which are widely acclaimed are the operas *Salome*, *Elektra*, and *Der Rosenkavalier*, the symphonic poems *Don Juan*, *Till Eulenspiegel*, and *Don Quixote*, and many songs of great lyrical beauty. *See* Section E.

Stravinsky, Igor (b. 1882), Russian composer and conductor, pupil of Rimsky-Korsakov. His early ballets *The Fire Bird* and *Petrushka* (regarded by some as his greatest work) were commissioned by Diaghilev and are representative of his early romantic style. *Pulcinella*, *Apollon musagète*, *Persephone*, and the opera *Oedipus Rex* are later works in his neo-classical style. Younger composers have been much influenced by his music. He became a French citizen in 1934, and a U.S. citizen in 1945. *See* Section E.

Strindberg, Johan August (1849–1912), Swedish writer of intense creative energy. His work is subjective and reflects his personal conflicts. He married three times but never happily. He produced some fifty-five plays as well as novels, stories, poems, and critical essays. *Lucky Peter*, *Gustav Adolf*, *Till Damascus*, *The Father*, *Miss Julie* are some of his plays.

Strong, Leonard Alfred George (1896–1958), poet, novelist, short story writer, and critic. Author, among other books, of *Dublin Days*, *The Brothers*, and *The Last Enemy*, and with Cecil D. Lewis editor of *A New Anthology of Modern Verse*.

Stuart, Arabella (1575–1615), daughter of the Earl of Lennox and cousin of James I., whose next heir she was both to the English and Scottish thrones. In 1610 she married William Seymour, afterwards Earl of Hertford and Duke of Somerset, and thereby incurring the king's displeasure, she was incarcerated in the Tower of London, where she died insane.

Suckling, Sir John (1609–42), wit, courtier, and poet; served under Gustavus Adolphus and in Charles I's first Scottish war (1639). Being concerned in a plot to rescue the Earl of Strafford from the Tower, he fled to France, where he may have killed himself. He wrote poems, ballads, songs, and prose work and is said to have invented cribbage.

Sudermann, Hermann (1857–1928), German dramatist, poet and novelist. His brilliant novel, *Frau Sorge* (1887), translated into English as *Dame Care* (1892), reached its 125th edition in 1912. From 1890 he produced a succession of realistic plays and novels.

Sullivan, Sir Arthur Seymour, C.V.O. (1842–1900), gifted composer, gained his first musical experiences as choir-boy at the Chapel Royal, and later studied at Leipzig. He composed oratorios but at the same time cultivated a lighter vein with pronounced success. Became famous for the light operas written in collaboration with W. S. Gilbert, which include *Trial by Jury*, *The Sorcerer*, *H.M.S. Pinafore*, *Pirates of Penzance*, *Patience*, *The Mikado*, *The Yeomen of the Guard*, *The Gondoliers*.

Sully, Maximilien de Béthune, Duc de (1560–1641), a French Protestant statesman, a friend and companion of Henry of Navarre. His *Memoirs* made notable reading.

Sun Yat Sen, Dr. (1867–1925), Chinese revolutionary, founder and first President of the Chinese Republic, 1912, resigning almost immediately in favour of Yuan Shih-kai. Was the first graduate of medicine at Hongkong, 1891. Founded in 1905 the China Revolutionary League in Europe and Japan, and played a large part in the revolution of 1911, which overthrew the Manchu Dynasty. *See also* Section **C, Part I.**

Sutherland, Graham Vivien, O.M. (b. 1903), British artist; he painted the 80th birthday portrait of Sir Winston Churchill commissioned by Parliament and designed the vast tapestry for Coventry Cathedral.

Sutro, Alfred (1863–1933), author and dramatist. His most successful plays were *The Walls of*

Jericho (1904) and *John Glayde's Honour* (1907).

Swedenborg, Emanuel (1689–1772), Swedish philosopher, scientist, mystic. In later life he announced that Divine authority had been given him to explain natural and spiritual evidences. He published in quick succession *Arcana Coelestia*, *The Apocalypse Revealed*, *Four Preliminary Doctrines*, and *The True Christian Religion*. He also claimed that his soul had been permitted to travel into hell, purgatory and heaven. His works became the scriptures of the sect named Swedenborgians.

Sweelinck, Jan Pieterszoon (1562–1621), famous Dutch organist and composer of sacred music. In his fugues he was the first to make independent use of the pedals, and thus prepared the way for Bach.

Swift, Jonathan Dean (1667–1745), was born at Dublin, educated at Trinity College at the expense of an uncle, became secretary to Sir William Temple, and looked for political preferment, but it did not come. Entering the Church, he was made Dean of St. Patrick's in 1713. Getting entangled in political controversy, and changing his views from the Whig to the Tory side, he lost favour with the popular party, but consoled himself with a devotion to literature, which he greatly enriched by some powerful satires, poems and discourses. *Gulliver's Travels*, *A Tale of a Tub* and *The Battle of the Books* are among the best-known works. His romantic attachment to "Stella" (Hester Johnson, whom he is believed to have married privately) and "Vanessa" (Esther Vanhomrigh), and their devotion to him, are familiar stories.

Swinburne, Algernon Charles (1837–1909), was educated at Oxford, and in the early 'sixties of last century gave to the world a number of poems of singular poetic beauty and musical charm, which procured him a high rank among English poets. Swinburne's most famous productions include *Atalanta in Calydon*, *Songs before Sunrise*, *Bothwell*, and *Mary Stuart*. Perhaps the best of his writings is his essay on William Blake.

Swithin, St. (*circa* 800–862), Bishop of Winchester in 852, and on the translation of his remains to a shrine in the interior of the cathedral from the graveyard, fixed for July 15th, 971, violent rain intervened, and, it is said, continued for forty days; hence the superstition as to rain upon St. Swithin's Day.

Symonds, John Addington (1840–93), acquired fame as a poet and writer on *The Renaissance Period in Italy*.

Synge, John Millington (1871–1909), Irish poet and playwright. His best known work, *The Playboy of The Western World*, met with a hostile reception when first produced in Dublin in 1907, but English audiences were at once enthusiastic.

Szigeti, Joseph (b. 1892), famous Hungarian violinist, who made his début in 1905, toured through Europe and settled for some years in England. He made an immense reputation on the Continent, and was Prof. at the Geneva Conservatorium, 1917–24.

Szymanowski, Karol (1833–1937), Polish composer and director of the Conservatoire at Warsaw.

T

Tacitus, Caius Cornelius (55–*circa* 120). His chief claim to remembrance is that he was one of the ablest of Roman historians, and left behind him a number of works; among them a life of Agricola and his *Annales*, which have formed the ground-work of much that has since been written on the period he covered.

Tacitus, Marcus Claudius (205–276), the Roman Emperor who succeeded Aurelian in A.D. 275. His short reign was wise and marked by moderation.

Taft, Wm. Howard (1857–1930), Chief Justice United States 1921–30. President of the United States 1908–13.

Tagore, Rabindranath (1861–1941), a Bengal poet who won the Nobel Literature Prize in 1913.

Talbot, William Henry Fox, F.R.S. (1800–1877), English scientist who first discovered the principles of photography in 1833. Inventor of the calotype or Talbot-type process of which modern photography is a development.

Talleyrand-Périgord, Charles Maurice de (1754-1838), French politician and diplomat, led a mission to England in 1792 and was Foreign Minister from 1797 until 1807. He represented France at the Congress of Vienna.

Tallis, Thomas (*c.* 1510–85), a distinguished musician, who was, as organist, attached to the Chapel Royal under Henry VIII., Edward VI. Mary, and Elizabeth, and was the composer o some of the finest of our Church music.

Tamerlane or Timur Lenk (= **Timur the Lame** (1336–1405), Mongol conqueror who turned his energies from deliverance of his people from barbarism to military conquest for its own sake. He made himself ruler of Samarkand in 1369 and in a series of campaigns conquered Iran, Transcaucasia, Iraq, Armenia and Georgia, invaded India and Syria, and defeated the Ottoman Turks at Angora. While preparing for the invasion of China death overtook him. His reputation is that of a ruthless and cruel conqueror who showed no mercy even to his fellow Moslems, but he was also a patron of literature and the arts. The Timurids are the line of rulers descended from him.

Tannhäuser, a mythical German minnesinger of the 13th century, who belonged, according to the legend handled so romantically in Wagner's opera, to the Salzburg family of Tanhusen, and was the beloved of Lisaura.

Tarkington, (Newton) Booth (1869–1946), American novelist whose best-known book is *Monsieur Beaucaire*, a sentimental romance which he successfully dramatised.

Tarquin Superbus (or "**the Proud**"), the last King of Rome. Was banished 510 B.C. After his deposition came the Consuls.

Tarquin the Elder, 5th King of Rome, succeeded Ancius Mastius 615 B.C., reformed the laws embellished the city, and was assassinated.

Tartini, Giuseppe (1692–1770), great violinist and anticipator of romanticism in Italian music. In practising double stops he discovered a differential tone which modified the intonation—becoming known as Tartini's or "the third" tone—a scientific explanation of which was later given by Helmholtz. His best-known sonata is *The Devil's Trill* written after a dream in which the devil played to him.

Tasman, Abel Janszoon (*circa* 1602–59), a famous Dutch navigator; in 1642 he discovered Tasmania and New Zealand shortly thereafter.

Tassigny, Jean de Lattre de, Marshal of France Hon. G.C.B. (1890–1952), outstanding commander of the Free French Movement in Second World War; High Commissioner and C.-in-C. Indo-China, 1950–52. C.-in-C. Land Forces, Western Europe, 1948–50.

Tasso, Torquato (1544–95), one of the great Italian epic poets, author of *Jerusalem Delivered* (Ital *Gerusalemme liberata*) which celebrates the First Crusade.

Tawney, Richard Henry, B.A. (1880–1962), great historian, pioneer of adult education, leader of socialist thought, the first critic of the affluent society; Prof. Emeritus Economic History Univ. of London, 1931–49. Among his standard works are *The Acquisitive Society*, *Equality Religion and the Rise of Capitalism*.

Taylor, Jeremy (1613–67), an English divine of great influence. The most famous of his works was his *Holy Living and Holy Dying*.

Tchaikovsky, Peter Ilich (1840–93), Russian composer. His music is melodious and intensely emotional and he excelled in several branches of composition. Amongst his works are ten operas, including *Eugene Onegin* and *The Queen of Spades* (both from stories by Pushkin), six symphonies, including the *Little Russian* and the magnificent *Pathétique*, his last completed work, ballets, including *Swan Lake*, *The Sleeping Beauty*, and *The Nutcracker*, the fantasies *Romeo and Juliet* and *Francesca da Rimini*, the piano concerto in B flat minor, the violin concerto in D, and numerous songs. *See* Section E.

Tedder, Marshal of the R.A.F., Arthur William 1st Baron, G.C.B., B.A. (b. 1890), was Deputy Supreme Commander under Eisenhower for the invasion of Europe, Chief of the Air Staff 1946–48; Chairman, Western Europe Chiefs o

Staff committee, 1948–50; Vice-Chairman of the Governors of the B.B.C., 1952–54; Chancellor Univ. of Cambridge, 1950.

lemann, Georg Philipp (1681–1767), composer of great facility and output in all fields of music. Founded Collegium Musicum at Leipzig Univ. and held appointments in many other German towns, including Hamburg. His music has vitality and originality of form and is appreciated today after long period of neglect.

lford, Thomas (1757–1834), was a Scottish working stone-mason who became a great engineer and attained special fame as a builder of bridges, the Menai Suspension Bridge being, perhaps, his greatest work. He constructed the Ellesmere Canal, made many hundreds of miles of difficult mountain roads, was chief engineer of the Caledonian Canal, and altogether did an immense amount of public work.

ll, William, a legendary figure in Swiss folk-lore. The story of his having been compelled by order of the imperial governor, Gessler, to shoot an apple from the head of his own son and his dramatic revenge is regarded as a legendary feat which has its origins in Teutonic myth. The Swiss hero of the Uri, however, played a great part in freeing his country from the Austrian yoke in the early part of the 14th century.

mple, Most Rev. Frederick (1821–1902), a famous Anglican Churchman who became Headmaster of Rugby in 1858; in 1860 attained notoriety as the author of the first of the much-controverted *Essays and Reviews*, advocated the disestablishment of the Irish Church in 1868, was appointed Bishop of Exeter in 1869, translated to London in 1885, and in 1896 was raised to the Primacy. He made a strong Archbishop, and dominated the Church with his vigorous personality.

mple, Most Rev. William, P.C., D.Litt., D.D. (1881–1944), one of the outstanding Christian leaders of his time and the son of Frederick Temple, was Archbishop of Canterbury, 1942–44, after being Headmaster of Repton, 1910–14, Bishop of Manchester, 1921–29, and Archbishop of York, 1929–42. His influence was felt among Christians of all denominations, and he strove for the unity of the Churches.

mple, Rt. Hon. Sir William, Bt. (1628–99), English statesman and author; Ambassador to The Hague in Charles II.'s time, and instrumental in bringing about the marriage between William of Orange and the Princess Mary. William III. twice offered him the position of Secretary of State, but he declined the honour, spending the years of his retirement at Moor Park (where Swift served him for a time as private secretary). Married **Dorothy Osborne** (1627–95), the letter-writer.

mplewood, Samuel John Gurney Hoare, 1st Viscount, P.C., G.C.S.I., G.B.E., C.M.G. (1880–1959), Conservative politician; Sec. of State for Air, 1922–29; Sec. of State for India, 1931–35; Foreign Sec., June–Dec. 1935; Home Sec., 1937–39; Special Ambassador to Spain, 1940–44.

niers, David (the younger) (1610–94), was born at Antwerp, and his paintings of the old rustic Flemish life are unsurpassed in their humour and fidelity. He died at Brussels. His father, David Teniers the elder (1582–1649), was also one of the leading landscape painters of the time.

nniel, Sir John (1820–1914), for over fifty years leading artist of *Punch*, illustrated numerous books, including *Alice in Wonderland*.

nnyson, Alfred Lord (1809–92), was Poet Laureate from 1850 to his death. Born at Somersby, in Lincolnshire, he showed poetic gifts while quite young, and in 1827, joined his brother Charles in the publication of *Poems by Two Brothers*. In 1847 he published *The Princess*; in 1850 *In Memoriam*, a poem of great beauty and depth of thought, in which he enshrined his affection for the memory of his dead friend Arthur Hallam; and in 1855 *Maud* appeared. His other works include *The Idylls of the Kings*, *Enoch Arden*, *Queen Mary*, *Harold*, and *Becket*.

rence, Publius Terentius Afer (*c.* 184–159 B.C.), Latin poet and dramatist, an African (Berber), who rose from the position of a slave to that of one of the most honoured men in Rome.

resa, St., or Theresa (1515–82), a Spanish saint and author, born at Avila, entered the Carmelite order in 1534, established a reformed order in 1562, became famous for her ascetic life and mystic visions, and died at Alba de Liste. Her religious writings include *The Way of Perfection* and *The Castle of the Soul*. She was canonised by Pope Gregory XV.

Terry, Dame Ellen, G.B.E. (Mrs. James Carew) (1848–1928), one of the most distinguished of English actresses. Played Shakespeare with Sir Henry Irving at the Lyceum and later appeared in plays of Bernard Shaw.

Tertullian, Quintus (*circa* 150–230), a Father and writer of the Latin Church. His chief work was his *Apologeticus*, a defence of Christianity.

Tetrazzini, Luisa (1871–1940), an Italian prima donna who sprang into prominence in 1907 by her wonderful singing at Covent Garden and hailed as a second Patti.

Tetzel, John (*c.* 1460–1519), the German Dominican monk and Inquisitor, the scandal of whose sale of indulgences roused Luther to publish his ninety-five theses at Wittenberg in 1517.

Thackeray, William Makepeace (1811–63), English novelist, author of *Vanity Fair*, *Pendennis*, *Esmond*, *The Newcomes*, *The Virginians*, *Philip* and *Lovel the Widower*. He edited the *Cornhill Magazine* from the first number, January, 1860, for a few years his most notable contributions being his *Roundabout Papers*. His *Yellowplush Papers* and *The Book of Snobs* (republished from *Punch*) were widely read and admired; and the lectures he delivered in America on *The Four Georges* were pungently powerful.

Thales of Miletus (*c.* 624–565 B.C.), earliest of the Greek scientists, he created a sensation by his prediction of an eclipse of the sun, which was visible at Miletus in 585 B.C. He looked upon water as the basis of all material things and in his mathematical work was the first to enunciate natural laws.

Thant, Sithu U (b. 1909), Secretary-General of the United Nations, 1962– ; Acting Sec.-Gen. after Dr. Hammarskjöld's death in 1961; Burmese Perm. Rep. to U.N. 1957–61.

Themistocles (*c.* 514–449 B.C.), Athenian soldier and statesman. By fortifying the harbour of Piræus as the port of Athens, by the remission of taxes on aliens, and by the creation of the Athenian navy, he established Athenian prosperity and made possible the later Athenian empire. Defeated the Persian fleet at Salamis in 480 B.C.

Theocritus (285–247 B.C.), one of the great Greek poets. Thirty *Idylls* have come down to us and a number of *Epigrams*.

Theodoric the Great (455–526), a celebrated King of the East Goths, born at Pannonia. In mediæval German romance he is known as "Dietrich von Bern," and had a reputation for good government, akin to that ascribed in England to King Alfred. He was the founder of the Gothic Kingdom of Italy.

Theodosius the Great (346–95) was Roman Emperor of the East for nearly twenty years. He gained victories over the Goths, and the year before his death became sole Emperor. Noted in ecclesiastical history for his conversion to Christianity, and for his submission to the penance imposed by St. Ambrose.

Theophrastus (*c.* 372–287 B.C.), succeeded Aristotle as President of the Lyceum at Athens. His *History of Plants* and his *Moral Characters* are the best known of his writings.

Thibaud, Jacques (1880–1953) famous French violinist. Killed in aeroplane crash.

Thierry, Jacques Nicolas Augustin (1795–1856), a distinguished French historian, known by his *History of the Norman Conquest*.

Thiers, Louis Adolphe (1797–1877), a French statesman and man of letters, author of *History of the French Revolution*.

Thomas, Dylan (1914–53), Welsh poet whose *Eighteen Poems* (1934) brought him instant recognition as an original and gifted artist. Other works include *Twenty-five Poems* (1936), *Deaths and Entrances* (1945), *Under Milk Wood*, a play for voices.

Thomson, James (1834–82), a Scottish poet who wrote *The City of Dreadful Night*.

Thomson, Sir (John) Arthur (1861–1933), was a well-known biologist.

Thomson, Sir Joseph (John), O.M., D.Sc., F.R.S.

(1856–1940), physicist and mathematician; Master of Trinity College, Cambridge, 1918–40; Cavendish Prof. of Experimental Physics, Cambridge, 1884–1919. Awarded Nobel Prize in 1906 for his work on conduction of electricity through gases; also discovered the electron. Pres. of the Royal Society, 1913–15. His son, **Sir George Paget Thomson**, (b. 1892) F.R.S., is also a physicist and Nobel Prizeman; former Master of Corpus Christi College, Cambridge.

Thoreau, Henry David (1817–62), American essayist and nature-worshipper. He was the friend of, and for a time lived with, Emerson. Best known for his classic *Walden, or Life in the Woods.*

Thorez Maurice (1900–64), French communist, under whose leadership the Communists became the largest single party in the French elections of 1945 and 1946; Sec.-Gen. of French Communist Party, 1930–64.

Thorndike, Dame Sybil, D.B.E., LL.D. (b. 1885), celebrated British actress who made her début with the Ben Greet players in 1904 and worked with the Old Vic from 1914–18. She won great success in the Greek tragedies, Shakespeare, Shaw, and in Grand Guignol. Both she and her husband, Sir Lewis Casson, received the honorary degree of D. Litt. at Oxford University in 1966 in commemoration of their long and splendid partnership.

Thornycroft, Sir William Hamo, R.A. (1850–1925), English sculptor whose works include the Gladstone Memorial, the statue of General Gordon in Trafalgar Square, of Queen Alexandra in the Royal Exchange, Lord Granville in the Houses of Parliament, Cromwell at Westminster, and John Bright in Rochdale.

Thorpe, Sir (Thomas) Edward, C.B., Ph.D., D.Sc., F.R.S. (1845–1925), a noted English chemist. His chief research work was done on paraffin hydrocarbons, and the derivatives of fluorine and phosphorus. Author of a standard *Dictionary of Applied Chemistry* and a *History of Chemistry.*

Thorwaldsen, Bertel (1770–1844), a famous Danish sculptor.

Thucydides (*c.* 460–399 B.C.), the first scientific historian, was an Athenian and took part in the Peloponnesian War, about which he wrote his *History.* Attempted an impartial account, weighing the testimony of eye-witnesses and keeping to carefully verified facts. The *History* is a graphic narrative, but Thucydides was not merely a chronicler; he saw the general significance of particular events and wished to pass on the political lessons of the past to the future. The speeches which he put into the mouths of the various actors reveal the political ideas and climate of opinion of contemporary Greece, and include the famous Funeral Oration of Pericles.

Tiberius, Claudius (42 B.C.–A.D. 37), the second Emperor of Rome, had an evil reputation but was an able ruler and successful soldier. Spent his later years in Capri.

Tillett, Benjamin (1860–1943), M.P. for North Salford 1917–24 and again 1929–31, came into prominence in the great dock strike of 1889. He was the organiser and secretary of the Dockers' Union; for several years alderman of the L.C.C.; and an active labour leader. Chairman of the General Council T.U.C. 1928–29.

Tillotson, John (1630–94), a celebrated preacher at Lincoln's Inn, "Popery" and "Atheism" being the main objects of his attacks: in 1691 became Archbishop of Canterbury.

Tindal, Matthew (*c.*1653–1733), noted English Deist.

Tintoretto (1518–94), Venetian painter whose aim it was to unite the colouring of Titian with the drawing of Michelangelo. He is among the most original and decorative of artists whose numerous paintings, mostly of religious subjects, were executed with great speed, some of them on enormous canvasses. His real name was Jacopo Robusti, and he was called Il Tintoretto (little dyer) after his father's trade. Three of his six children were painters.

Tippett, Sir, Michael Kemp, Kt., (b. 1905), English composer whose works include Concerto for Orchestra, *Midsummer Marriage, King Priam,* the cantata *Boyhood's End,* and the song-cycle *The Heart's Assurance. See* Section E.

Titian, or Tiziano Vecelli (1477–1576), one of the greatest of painters. He studied under the Bellinis, and made his first essays in painting for the public in conjunction with Giorgione, whom he soon surpassed. In 1511 he was at Padua, where he painted some notable frescoes; in 1512 he was back in Venice, with a studio on the Grand Canal, employed on important commissions. From this time forward he was in great demand, and exercised his marvellous powers almost to the end of his life, dying of the plague at ninety-nine.

Titiens (or Tietjens), Teresa (1831–77), a famous German operatic prima donna and concert-room singer.

Tito, Marshal (Josif Broz) (b. 1892), Prime Minister of the Federal People's Republic of Yugoslavia since 1945. Leader of the partisan forces which successfully fought against German occupation. President National Liberation Committee, 1943.

Titus (40–81), the Roman Emperor, and son of Vespasian. Attained great renown by his successful part in the Jewish war which terminated in the capture and destruction of Jerusalem: he was deemed a profligate and a tyrant, but no sooner was he in sole power than he exerted himself to the utmost to please the people, completed the Colosseum, built splendid baths, and otherwise made himself popular.

Tizard, Sir Henry Thomas, G.C.B., F.R.S. (1885–1959), scientist and administrator; Pres. British Association, 1948. Played important part in the higher scientific direction of the second world war and as Chair. Advisory Council on Scientific Policy, 1947–52.

Tocqueville, Alexis, Comte de (1805–59), author of *De La Démocratie en Amérique* and *De L'Ancien Régime,* which set out nineteenth-century liberal ideas.

Todd, Alexander Robertus, 1st Baron, D.Sc., F.R.S. (b. 1907), British biochemist; Prof. of Organic Chemistry at Cambridge, 1944– . For his work on the structures of nucleic acids he received the 1957 Nobel Prize for Chemistry.

Tolstoy, Count Leo Nikolayevitch (1828–1910), was the most distinguished personality in modern Russian literature. Born of a good family, he was for a time in the army, but was so greatly moved by the trials and sufferings of the people that, out of pure sympathy of heart, he was impelled "to take up his pen and write." At twenty-four he published his *Childhood*, and in 1854, while in camp in the Crimea, wrote his *Tales from Sebastopol*, which procured him considerable literary fame. Later on he was a persistent advocate of progressive ideas, and, before the Emancipation Act for freeing all Russian serfs was enforced, he himself had given the serfs on his own estate their freedom. In 1862 he married, and settled down to a quiet country life, shortly afterwards publishing his *War and Peace* and *Anna Karenina.* In his latter years Tolstoy developed a sort of religious mysticism. Among his later works are *The Power of Darkness. The Kreutzer Sonata, The Cossacks, Resurrection*, and *The End of the Age.*

Tooke, John Horne (1736–1812), English politician and pamphleteer, was a supporter of Wilkes and later Pitt. His tracts advocated reform. After the French Revolution was tried for high treason, but was acquitted.

Toole, John Lawrence (1832–1906), for half a century a popular English comedian.

Torquemada, Tomás de (1420–98), the chief officer of the Spanish Inquisition.

Torricelli, Evangelista (1608–47), Galileo's pupil He invented the barometer and improved both the microscope and the telescope.

Toscanini, Arturo (1867–1957), famous Italian conductor, La Scala Theatre, Milan, 1898–1908 and 1920–29; at the Metropolitan Opera House New York, 1908–15; and of the Philharmonic Symphony Society of New York, 1926–36. Returned to Milan in 1946 after a ten-year exile.

Toulouse-Lautrec, Henri de (1864–1901), French painter, whose pictures portray with stark realism certain aspects of Parisian life in the nineties.

Tovey, Sir Donald Francis (1875–1940), pianist and composer who for 25 years held the chair o music at the University of Edinburgh. Outstanding among his many writings is *Essays i Musical Analysis*, and his compositions include chamber music, a piano concerto, and an opera *The Bride of Dionysus.*

mbee, Arnold (1852–83), after graduating at
)xford, devoted himself to practical philan-
hropy and social reform. From his self-deny-
ng efforts sprang the settlement in East London
—Toynbee Hall.

mbee, Arnold Joseph, C.H., Hon.D.Litt. (Ox-
ord, Cambridge, and Birmingham) (b. 1889),
minent scholar and historian, nephew of above.
)ir. of Studies Royal Inst. of Int. Affairs, 1925–
5. Major work *A Study of History.*

jan (*circa* 52–117) was Roman Emperor from
8 to his death. His rule was enlightened, and
e was esteemed by his people.

e, Sir Herbert Beerbohm (1852–1917), the
ondon actor-manager who scored successes
t the Haymarket and His Majesty's Theatre.

nchard, Marshal of the R.A.F., Viscount,
.C.B., O.M., G.C.V.O., D.S.O. (1873–1956),
hief of Air Staff, 1918–29; Commissioner of
olice of the Metropolis, 1931–35; often known
s the father of the Air Force and largely
esponsible for the establishment of the R.A.F.
ollege at Cranwell and the Hendon Police
ollege.

nt, 1st Baron, of Nottingham (Jesse Boot) (1850–
931), founder of Boots Cash Chemists, Ltd.;
great benefactor of Nottingham, especially
f the University of Nottingham.

velyan, George Macaulay, O.M., C.B.E. (1876–
962). English historian, son of Sir George Otto
revelyan and great nephew of Thomas
abbington Macaulay. Regius Professor of
lodern History at Cambridge 1927–40; Master
f Trinity College, 1940. Chancellor of Dur-
am University, 1949. His chief works are:
listory of England; a trilogy of books on *Gari-
aldi*; *England under the Stuarts*; *England under
ueen Anne*; *Grey of Fallodon*; *English Social
listory*; *An Autobiography and other Essays.*

velyan, Rt. Hon. Sir George Otto, 1st Bt.,
.M. (1838–1928). Liberal statesman and
istorian. Became Chief Secretary for Ireland
1882, and was later Secretary of State for
cotland. Wrote a biography of his uncle,
ord Macaulay, which was highly praised.
ather of Professor G. M. Trevelyan.

vithick, Richard (1771–1833), a Cornish mine-
anager's son, who invented the road-loco-
otive, putting upon the highway on Christmas
ve, 1801, the first steam-propelled vehicle for
assengers.

llope, Anthony (1815–82), author of many
ovels. His Barchester series depicts a number
f scenes of higher clerical life with great fidelity
nd success.

sky, Leon, name assumed by Lev Davidovich
ronstein (1879–1940), one of the leaders of the
olshevist revolution. War Minister of the Bol-
hevist Government and its leading representa-
ve at the Brest-Litovsk conference of 1917–18.
e differed from the Communist Party on policy
nd was dismissed from office in 1925. In 1929
ook up exile in Mexico where he was assassin-
ted.

man, Harry S. (b. 1884), President of the
nited States, 1945–53. Inherited the Presi-
ency on the death of Roosevelt in 1945 and won
e Pres. election in 1948. He took the historic
ecision to enter Korea in 1950, dismissed Gen.
acArthur in 1951, and will perhaps best be
membered for his "Point Four" programme
raising levels of living in backward, and under-
eveloped countries.

i Das (1532–1623), mediæval poet of India
hose great masterpiece *Rām-Charit-Mánas*
opularly known as the *Rāmayana* and based
the Sanskrit epic of Vālmiki) is venerated by
Hindus just as the Bible is in the West.

nne, Henri de la Tour d'Auvergne, Vicomte de
611–75), a famous French commander and
arshal of France, who was highly successful in
e Thirty Years' War.

enev, Ivan Serveyvich (1818–83), was a friend
Gogol and Tolstoy, and a famous Russian
ovelist and short-story writer. His works
ere frequently satirical and directed against
e oppression of the peasants by the nobles.
as the inventor of the term "nihilist" to
scribe the Russian anarchist movement.

er, Joseph Mallord William, R.A. (1775–1851).
as the son of a London barber, but while quite
child showed the possession of artistic genius.
1789, after some miscellaneous schooling, he
entered the Royal Academy classes, and soon began to make headway. Of his larger pictures may be mentioned *The Sun Rising through Vapour, Crossing the Brook, Dido Building Carthage, The Fighting Téméraire,* and *Calais Pier.* Ruskin, in his *Modern Painters,* wrote with great eloquence and critical insight regarding Turner's work, and brought about a fuller appreciation of his genius. Turner never married, and took little interest in anything outside his art. He left the oil paintings and drawings he had preserved to the National Gallery.

Tussaud, Madame Marie (1760–1850), a Swiss who while practising the art of modelling wax in Paris at the time of the French Revolution, made her escape to England and set up a small exhibition of wax figures in the Strand, later carried on by her son, grandson and great-grandson at Baker Street and in 1884 transferred to Marylebone Road.

Tut-ankh-amen (*circa* 1350 B.C.), an Egyptian Pharaoh of the 18th dynasty, whose tomb was discovered by Howard Carter in 1922, with the mummy and gold sarcophagus intact. The magnificence of the objects found aroused world-wide interest.

Twain Mark. (*See* **Clemens, Samuel L.**)

Tweedsmuir, John Buchan, 1st Baron, C.H. (1875–1940), Gov.-Gen. of Canada 1935–40, journalist, politician, and author, wrote numerous biographies, historical novels, and adventure stories, including *Montrose, The Path of the King, Greenmantle,* and *Sick-Heart River,* and an autobiography *Memory Hold the Door.* Under the pen name "O. Douglas" his sister, Anna (d. 1948), published some charming tales of domestic life.

Tyler, Wat (d. 1381), the leader of the peasants' revolt of Richard II.'s time against the iniquitous poll-tax. Over 100,000 peasants followed Tyler into London in June 1381, and the king met them in Smithfield and made promises of redress that were never fulfilled. It was at this meeting that Sir William Walworth, Lord Mayor of London, stabbed Tyler with a dagger, and afterwards handed him over to his followers to kill outright.

Tyndale, William (*c.* 1492–1536), was educated at Oxford, and conceived a strong desire to be the medium of presenting the Bible to his countrymen in their own language. He completed the translation of the New Testament at Wittenburg, where he was associated with Luther. This version was first published at Antwerp, and then found its way to England, where it was publicly burnt at St. Paul's Cross. Tyndale afterwards was associated with Miles Coverdale in a translation of the Old Testament, but only completed the Pentateuch and the book of Jonah. Antwerp was Tyndale's retreat during this later period, and in 1535 he was arrested for heresy and put to death by strangling and burning.

Tyndall, Prof. John, F.R.S. (1820–93), was an eminent scientist. His books on light, sound, and heat are well-known text-books.

U

Ulanova, Galina (b. 1910), Russian ballet dancer, made her début in 1928 and is the world's greatest living exponent of the art. She danced in Florence in 1951 and in London in 1956.

Undset, Sigrid (1882–1949), Norwegian novelist, daughter of a distinguished Norwegian antiquary, from whom she derived her knowledge of life in ancient and mediaeval Norway. Her first success came with *Jenny* (1911), and the great works based on mediaeval history, *Kristin Lavransdatter* (1920–22) and *Olav Audunsson* (1925–27), won for her the 1928 Nobel Prize for Literature.

Unwin, Sir Raymond (1863–1940), English architect and expert on Town Planning, who became known as the architect of the first garden city at Letchworth, and of the Hampstead Garden Suburb.

Ursula, St., is said to have been an English princess, who with 11,000 virgins set out on a pilgrimage, but compelled by a fierce storm to take refuge in Cologne, was there put to death with her following by an army of Huns.

Usher or Ussher, James (1581–1656), Irish prelate and scholar, one of the most distinguished theologians of his day. He worked out a system of dates setting the creation at 4004 B.C.

V

Valentine, St., was a Christian martyr of the reign of the Emperor Claudius II (d. 270 A.D.). His festival was commemorated on February 14 before Gregory the Great's time. The custom of sending valentines had its origin in a heathen practice associated with the worship of Juno about this date in the calendar, and had no connection with the saint.

Vanbrugh, Sir John (1664–1726), was a prominent architect as well as a successful dramatist.

Vancouver, George (1758–98), a British navigator who served under Captain Cook and later explored the Gulf of Georgia and the Straits of San Juan de Fuca, as also the shores of Vancouver Island.

Vanderbilt, Cornelius (1794–1877), a noted American merchant and railway speculator who accumulated a fortune of twenty millions sterling. His son William Henry Vanderbilt (1821–85) inherited and added to it.

Van Dyck (or Vandyke), Sir Anthony (1599–1641), was born at Antwerp, and after studying under Rubens went to Italy and there made a name as a portrait painter. In 1629 he came to England on the invitation of Charles I., but remained only a short time; in 1631 Charles prevailed upon him to return, made him a knight, granted him an annuity, and he became the Society painter of the day.

Vane, Sir Henry (1613–62), was a prominent statesman and diplomatist. At the Restoration he was arrested as an enemy of the State and ultimately beheaded on Tower Hill.

Van Gogh, Vincent (1853–1890), Dutch painter of some of the most colourful pictures ever created. With passionate intensity of feeling he painted without pause whatever he found around him—landscapes, still-lifes, portraits; his was a truly personal art. His life was one of pain, sorrow and often despair and in the end he committed suicide.

Van Loon, Hendrik Willem (1882–1944), Dutch-American historian, born in Rotterdam, who became famous in 1922 with the publication of *The Story of Mankind*, a picture history-book originally intended for children.

Vauban, Marshal Sebastien le Prestre de (1633–1707), a renowned French military engineer who introduced great improvements in methods of fortification, conducted fifty-three sieges, and took part in 140 battles.

Vaughan Williams, Ralph, O.M., M.A., D. Mus. (1872–1958), English composer. After Charterhouse and Cambridge he studied music in Berlin under Max Bruch and, later in Paris, under Ravel. He wrote nine symphonies besides a number of choral and orchestral works including *Sancta Civitas* and *Benedicite*, *Magnificat*, *Four Tudor Portraits*, *Dona Nobis Pacem*, operas including *Hugh the Drover*, *Riders to the Sea*, ballets, chamber music and songs. He showed great interest in folk tunes. *See* Section E.

Velasquez, Diego (1465–1523), a Spanish soldier and companion of Columbus, sent to conquer Cuba. Velasquez founded Santiago and Havana.

Velazquez, Diego Rodriguez de Silvay (1599–1660), a famous Spanish painter, whose pictures rank among the finest in Spanish art.

Venizelos, Eleutherios (1864–1936), the Greek patriot and statesman, suffered many vicissitudes of fortune during his career. A Cretan by birth, he became Prime Minister of Greece for the first time in 1910, and again on several subsequent occasions, but died in exile. Best known probably for his activity during the Balkan wars, his finally successful attempts to bring his country into the first world war on the side of the Entente Powers, and his ambitions in Asia Minor. At the post-war conferences in 1919 he exercised more influence than anyone else outside the "Big Four."

Verdi, Giuseppe (1813–1901), Italian composer, foremost figure in 19th-century opera. Early works include *Nabucco*, *Ernani*, *I Due Foscani*, and *Macbeth*. A middle period is represented by *Rigoletto*, *Il Trovatore*, *La Traviata*, *Un Ballo in Maschera*, and *Don Carlo*. To the last and
greatest period of his life belong *Aïda*, *Otell*
and his last opera *Falstaff*, produced when h
was 80. *See* Section E.

Verlaine, Paul (1844–1896), French poet, also we
known for his memoirs and confessions; die
in great poverty and degradation in Paris.

Vermeer, Jan (1632–75), Dutch painter and th
greatest of all the "Little Masters." Ja
Vermeer of Delft, as he was frequently referre
to, was born in Delft, and obtained considerab
recognition in his lifetime, but strangely hi
existence was entirely overlooked after hi
death, and until 1860 his paintings were attri
buted to other Dutch painters. *Lady at th*
Virginals is in the National Gallery.

Verne, Jules (1828–1905), was one of the mos
popular authors of wonder-stories in Europ
The best-known of his numerous works are *Fiv*
Weeks in a Balloon, *Twenty Thousand League*
Under the Sea, *Round the World in Eighty Day*

Vernier, Pierre (1580–1637), inventor of the sma
sliding scale which enables readings on a gradu
ated scale to be taken to a fraction of a divisio

Veronese, Paul, or Paolo Cagliari (1528–88),
celebrated Italian painter of religious subject
His *Marriage Feast at Cana in Galilee*, *The Feas*
in the House of Simon, and *The Presentation*
the Family of Darius to Alexander, are paintings
world-wide celebrity, while his *Adoration of th*
Magi, in our National Gallery is a grand work.

Veronica, St., a legendary woman of Jerusalem
who was said to have handed to Christ her ker
chief on His way to Calvary. The old belief wa
that the Redeemer wiped His brow therewith
leaving on the handkerchief a miraculous im
pression of His face, the so-called "Veronicon.
The Saint is commemorated on February 4th.

Verwoerd, Dr. Hendrik Frensch (1901–66), suc
ceeded J. G. Strydom as Prime Minister
South Africa in 1958. Prof. of Psychology a
Stellenbosch Univ., 1928–50. Assassinated
Parliament, Cape Town, 6 Sept. 1966. *Se*
also Section C.

Vespasian (Titus Flavius Vespasinus) (9–79 A.D.
was Roman Emperor during the last nine yea
of his life. At one time he commanded th
Roman army of occupation in Britain.

Vespucci, Amerigo (1451–1512), Florentine me
chant and navigator, who settled in Spain a
commercial agent of the house of Medici. H
made several voyages across the Atlantic an
according to his own accounts, which are di
puted by many authorities, reached the Ame
can continent on June 16, 1497. A Germa
geographer paid him the tribute of giving th
name America to what is now known as Sout
America in a map he published in 1507.

Victor Emmanuel II. (1820–78) was King of Sa
dinia from 1849 to 1861, became King of Ital
according the the Proclamation of the Sardinia
Senate; but it was not until 1870, when th
unification of Italy was fully secured, that th
title came to have its true significance.

Victoria (1819–1901), Queen of Great Britain an
Ireland and Empress of India, was daughter
the Duke of Kent, and came to the throne
1837 on the death of her uncle, William I
In 1840 she married Prince Albert of Sax
Coburg-Gotha, who died in 1861. Lord Me
bourne was Prime Minister at the date of th
Queen's accession, and for a number of years th
country lived through troublesome times, th
Corn Law and Chartist agitations being at tim
very threatening, but a more settled condition
things supervened, and for the remainder of th
long and illustrious Victorian reign there wa
no serious home unrest. The Jubilee of Quee
Victoria's accession was celebrated in 188
and the Diamond Jubilee 10 years later.

Villeneuvre, Pierre Charles Baptiste Silvest
(1763–1806), the French naval commander wh
was opposed to Nelson at Trafalgar an
captured along with his ship, the *Bucentaure*.

Villon, François (1431–*c.* 1485), French poet wh
lived at a turbulent time in French history at th
close of the Hundred Years War. His exta
works consist of *Le Lais* (or *Petit Testamen*
and *Grand Testament*, masterpieces of Fren
mediæval verse.

Virgil (Publius Vergilius Maro) (70–19 B.C.), th
great Roman epic poet, was born near Mantu
and cultivated a farm in the adjacent village
Andes. He proceeded to Rome in his thirtie

year to obtain redress for the occupation of his ands by the military. Became known to Octavian and Mæcenas, and, having had his demand satisfied, began the writing of his *Eclogues*. *The Georgics* followed: his most famous work, the *Æneid*, comprised twelve books dealing with the story of the wanderings of Æneas after the destruction of Troy.

us, St., Roman Catholic saint and martyr, who ived in the 4th century. It used to be the custom to dance before his shrine on this festival day, June 15th, in the belief that good health was thereby ensured for the next twelvemonth. The nervous ailment, St. Vitus' dance, derives its name from this practice.

valdi, Antonio (*c.* 1675–1743), Venetian composer. For many years violin master at the Ospedal della Pieta there. His output of orchestral works was prolific, and their reassessment in recent years has immensely added to his reputation, long disparaged by English writers. Bach indeed arranged some of his violin pieces for the harpsichord. *See* Section E.

lta, Alessandro (1745–1827), Italian physicist, professor at Como and Pavia. Working on the results of Galvani, he found that the essential thing in producing an electric current was contact of dissimilar metals. He invented the voltaic pile, the first instrument for producing an electric current, and thereby laid the foundation of electrochemistry.

ltaire, François-Marie Arouet de (1694–1778), one of the greatest of French philosophers and writers. His first essays offended the authorities, and he lived in London for a couple of years (1726–28), and there wrote some of his dramas. Returning to France he published his *Philosophical Letters*, which aroused the enmity of the priesthood. At this juncture, the Marquise du Châtelet offered him the asylum of her castle of Cirey, and for the next fifteen years he made this his home, writing there his *Discourses on Man*, *Essay on the Morals and Spirit of Nations*, *Age of Louis XIV*., &c. From 1750–53 he lived in Berlin, on the invitation of Frederick the Great.

ndel, Joost van den (1587–1679), the greatest of the Dutch poets. Most of his dramas are on biblical subjects, and the two most famous are *Jephtha* and *Lucifer*.

roshilov, Marshal of the Soviet Union, Klimentiy Efremovich (b. 1881), President of the Supreme Soviet of the U.S.S.R., 1953–60; commander of the Leningrad defences in 1941.

shinsky, Andrei Yanuarievich (1883–1954), Russian jurist and diplomat; conducted the prosecution of the Moscow treason trials, 1936–38; represented Russian interests at U.N.

W

ade, George (1668–1748), military engineer who after the Jacobite rebellion of 1715 commanded the royal forces in Scotland and constructed the great military roads through the Highlands, some of which have continued to be the main ines of communication. Promoted to Field-Marshal in 1743 and in 1744 George II made him Commander-in-Chief in England. In the ast Jacobite rising of 1745 his army was the irst to be evaded by the Young Pretender, Charles Edward, on his famous march south.

gner, Richard (1813–83), German composer, born at Leipzig. He achieved a new type of musical expression in his operas by the complete union of music and drama, and his influence on ater composers was immense. He made use of the *leitmotif* principle and was his own librettist. His originality and modernism aroused a good deal of opposition, and he was exiled for some years. But he was supported by many loyal riends, including Liszt, the young King Ludwig of Bavaria, and the philosopher Nietzsche. He began the music of the *Ring des Nibelungen* n 1853, finishing it a quarter of a century later. t was not until 1876 that the whole of this reat drama (Rheingold, Valkyrie, Siegfried, Götterdämmerung) was performed at Bayreuth nder the conductor Hans Richter. Other operas include *The Flying Dutchman*, *Rienzi*, *Tannhäuser*, *Lohengrin*, *Tristan und Isolde*, *Die Meistersinger von Nürnberg*, *Parsifal*, a religious drama. He married Liszt's daughter Cosima, formerly wife of his friend Hans von Bülow *See* Section E.

Waley, Arthur, C.H., C.B.E., M.A. (1889–1966), orientalist, well known for his translations of Chinese and Japanese poetry and prose, being the first to bring the literature of those countries to the western world.

Walker, George (1618–90), the hero of the siege of Londonderry, in 1688, who kept the besiegers at bay for 105 days.

Wallace, Alfred Russel, O.M., F.R.S., LL.D. (1823–1913), celebrated naturalist, a native of Usk, attracted much notice as far back as 1853 by his book *Travels on the Amazon*, detailing experiences in that region. In 1858, while down with illness in the Moluccas, the idea of the evolution theory occurred to him, and curious to say, he drafted his first notes upon it and sent them to Darwin in England while the latter was on the eve of publishing his own exposition of the theory, the result being the reading of a joint paper on the subject to the Linnean Society. The coincidence was fully acknowledged by Darwin. There are differences, however, between the points of view of the two thinkers.

Wallace, Edgar (1875–1932), English novelist and playwright, famous for his detective thrillers.

Wallace, Sir Richard, Bt. (1818–90), son of the Marquis of Hertford, and inheritor from him of a famous collection of pictures and other works of art to which he himself added largely. This was bequeathed to the nation by his widow along with Hertford House and now forms one of the most important exhibitions in London.

Wallace, Sir William (*circa* 1270–1305), the great Scottish patriot and chieftain who led the Scottish armies against Edward I., and for a time the English were kept completely in check. Later, Edward defeated him at Falkirk, and finally in 1304 he was captured, taken to London, condemned for treason, executed at Smithfield.

Wallenstein, Albrecht von (1583–1634), German soldier and statesman during the Thirty Years' War. An able administrator of his own estates, he sought the unity of Germany, but was distrusted and eventually assassinated.

Waller, Edmund (1606–87), was one of the most graceful of English poets, who tuned his lyre to suit both the Cromwellians when they were a power, and Charles II, when his turn came.

Walpole Horace, 4th Earl of Orford (1717–97), younger son of Sir Robert Walpole. He was a member of Parliament from 1741 to 1768, when he retired to his favourite house at Strawberry Hill (" a little Gothic castle ") and devoted himself to the writing of books and the accumulation of works of art. His letters give a graphic picture of Georgian England.

Walpole, Sir Hugh Seymour C.B.E., (1884—1941), a well-known British novelist, whose novels include *Fortitude*, *The Dark Forest*, *Jeremy*, and *Mr. Traill*.

Walpole, Sir Robert, K.G.(1st Earl of Orford) (1676-1745), great 18th-century Whig statesman. He sat in the House of Commons for over forty years, and was Prime Minister for the record period of twenty-one years. Although he enriched himself at the public expense, he was a great financial statesman, and his management of the national debt, encouragement of trade and industry, and his mercantilist colonial policy made England materially very prosperous.

Walter, Bruno (1876–1962), a noted conductor of German birth and American citizenship, associated especially with the opera in many different cities.

Walter, John (1776–1847), son of the founder of *The Times* and known as the second John Walter. Was the leading spirit of *The Times* from 1803 to 1847, and it was his efforts that made the journal the greatest newspaper in the world.

Walton, Izaak (1593–1683), one of the most lovable of English writers, the famous author of *The Compleat Angler, or the Contemplative Man's Recreation*. Also published lives of Donne, Hooker and George Herbert.

Walton, Sir William Turner (b. 1902), English composer, whose works include concertos for string instruments, a symphony, and coronation march, *Crown Imperial*, and an oratorio, *Belshazzar's Feast*.

Warbeck, Perkin (1474–99), a Pretender to the English Crown. The son of a Tournai Jew, he claimed to be Richard, Duke of York, supposed to have been murdered in the Tower, and therefore entitled to the throne of England in preference to its then occupant, Henry VII. The Duchess of Burgundy and Charles VIII. of France and James IV. of Scotland gave him their countenance. Warbeck was enabled in 1497 to appear in England at the head of a force of 7,000 men, but was easily defeated, tried for treason and hanged at Tyburn.

Warwick, Richard Neville, Earl of (*circa* 1428–71). "The King Maker," was the leader of the York party in the Wars of the Roses. At the battle of Northampton he made Henry VI. captive, and afterwards proclaimed Edward, Earl of March, king under the title of Edward IV. Then, when Edward showed a disposition to resent Warwick's protection, the latter drove Edward from the country and once more placed Henry VI. on the throne. He lost his life at the battle of Barnet.

Washington, Booker Taliaferro (1856–1915), a famous negro educationist who was Principal of Tuskegee Institute, Alabama, the first and greatest Institute for negro education, from 1881 until his death. He was a tireless worker for a better understanding between negroes and whites. Wrote several books, including his autobiography, *Up from Slavery.*

Washington, George (1732–99), was of English descent, and was living on his American estate at Mount Vernon when the dispute between the British home government and the colonists broke out. He became one of the leaders of the local opposition, and later was elected to the first Congress at Philadelphia. The following year, 1775, saw him Commander-in-Chief of the American army, and from that time to the end of the struggle in 1783 he was trusted and adored by the people, and on the founding of the Republic became its first President in 1789. He served a second term of office from 1793 onwards, and refused election for a third time.

Watson, John Broadus (1878–1958), American psychologist of international fame who formulated the theory known as Behavourism, in which behaviour is described in terms of physiological response to stimuli. It substantiates the work of Pavlov. *See* **J6.**

Watson-Watt, Sir Robert, F.R.S. (b. 1892), British physicist and engineer, chief of team of scientists engaged in radio location research which resulted in every aircraft and ship being equipped with radar aids enabling them to detect, locate, and shadow enemy craft with great accuracy during the Second World War.

Watt, James, F.R.S., F.R.S.E. (1736–1819). Born at Greenock, this genius was originally a mathematical instrument maker, and being brought into touch with mechanical problems, conceived the idea of the modern, that is, high-pressure steam-engine. Watt took out his first patent in 1769; the engine, however, was used only for mining operations until 1785, when it was applied to a cotton factory, Watt being greatly aided in his developments of the engine by the business ability of his partner, Matthew Boulton.

Watteau, Jean Antoine (1684–1721), a French landscape painter of transcendent ability, and especially great in *genre.* His shepherds and shepherdesses, rustic dance and fête scenes were wonderful for their harmonious brilliancy of coloration. His *chef-d'œuvre* is the *Embarkation for the Isle of Cytherus*, in the Louvre.

Watts, George Frederick, O.M., R.A. (1817–1904), occupied a unique place in English art. His works are numerous; among them may be mentioned *Love and Death*, *Hope* and *The Angel of Death.* He bequeathed to the nation a large number of his finest pictures. His portraits of Swinburne, Carlyle, Cardinal Manning, Browning, and Tennyson are especially fine.

Watts, Isaac (1674–1748), a great English hymn-writer; author of *O God, our help in ages past.*

Watts-Dunton, Walter Theordore (1836–1914), a prominent critic and close friend of Swinburne, author of *The Coming of Love* and *Aylwin.*

Waugh, Evelyn Arthur St. John (1903–66), English satirical writer, one of the foremost of his generation; author of *Vile Bodies*, *The Loved One*, *Brideshead Revisited*, *Life of Edmun Champion*, *The Ordeal of Gilbert Pinfold*, an an autobiography, *A Little Learning.* Hi brother, **Alec Waugh** (b. 1898), also a successfu writer, is the author of *The Loom of Youth.*

Wavell, Field Marshal Earl, P.C., G.C.B G.C.S.I., G.C.I.E., C.M.G., M.C. (1883–1950) Viceroy of India 1943–47; Com.-in-Chie India 1941–43; Com.-in-Chief British Forces i Middle East 1939–41; previously Souther Command 1938–39 and of troops in Palestin 1937–39. Described as one of the cleveres generals in the British Army; his strateg against the Italians in the winter campaign o 1940–41 was brilliantly successful.

Webb, Sir Aston, G.C.V.O., C.B., R.A. (1849–1930), President of the Royal Academy, 1919–24, one of our foremost architects, and the designer of the general scheme of the Victori Memorial in front of Buckingham Palace, the new Birmingham University, the Britannia Nava College at Dartmouth and other fine structures

Webb, Matthew (1848–83), in 1875 swam the English Channel in twenty-two hours, and was drowned eight years later in an attempt t swim through the Niagara rapids.

Webb, Rt. Hon. Sidney James, O.M. (1859–1947) eminent Socialist, one of the founders o the Fabian Society in 1884. Sec. of State fo the Colonies 1929–31, and for the Dominions 1929–30. Pres. of Board of Trade in first Labou Government, 1924. His wife Beatrice, equally with himself, was a great investigator an writer on political and economic affairs. Among their books were *History of Trade Unionism English Local Government* and *Soviet Communism.* He founded (1913) and edited (til 1922) the *New Statesman.* Raised to the Peerage, 1929, as **Lord Passfield.**

Weber, Carl Maria Friedrich Ernst von (1786–1826), German composer, who is usually looke upon as the founder of the German nationa opera and of the German romantic movement which found its complete musical expression i Wagner. His fame rests principally on hi three great operas *Der Freischütz*, *Euryanthe* and *Oberon*, the last being written for Coven Garden. He was an able pianist, conductor and musical director as well as composer. H died in London after the performance of *Oberon* and his body was taken back to Dresden in 1844

Webster, Daniel (1782–1852), an American, who as statesman, lawyer, and orator, exerte enormous influence on American constitutiona ideas and practice. Served twice as Secretar of State and in 1842 negotiated the Ashburto Treaty which settled the Maine–Canad boundary.

Webster, Noah (1758–1843), the American lexicographer and grammarian. Author of th *Dictionary of the English Language*, and work on literary and political themes.

Wedgwood, Josiah, F.R.S. (1730–95), was the mos famous of English potters. He was born a Burslem, served an apprenticeship that carrie him through all the branches of the trade, and i 1759 was able to set up in business for himsel with money he had saved. He persevere through failure after failure, and in a few year produced such an improved form of ware tha it came into great demand. He engaged Flaxman to make classical designs for him, and hi pottery became the fashion, and led to a grea extension of the Staffordshire earthenware industry.

Weill, Kurt (1900–50), German composer o satirical, surrealist operas, including *Di Dreigroschenoper* (librettist Bert Brecht), an musical comedies, including *Lady in the Dar* and *One Touch of Venus.* He left Germany i 1933 for France and went to the United State in 1935.

Weingartner, Paul Felix von (1863–1942), Austria conductor and composer, studied at Leipzig an with Liszt. Established himself as a brillian conductor, held several appointments i Germany, succeeded Mahler at the Vienn State Opera, and became head of the Conservatory of Music at Basle. His compositio include six symphonies, several operas, an some chamber music.

Weismann, August (1834–1914), a distinguishe German biologist who was Prof. of Zoology a

eiburg, 1866–1912. He is remembered for his
eory that heredity is a question of the continu-
of the germ-plasm and that acquired charac-
ristics cannot be transmitted to descendants.
zmann, Chaim, D.Sc., LL.D., Ph.D. (1874–
52), Zionist leader, became provisional Presi-
ent of Israel in May 1948, and was elected first
resident in 1949. Distinguished micro-
ologist and organic chemist.
esley, Richard Colley Wellesley, Marquess,
G., P.C., K.P. (1760–1842) was Pitt's famous
vernor general of India, the son of the Earl of
ornington, the first professor of music at
inity College, Dublin, and elder brother of the
ke of Wellington.
ington, Arthur Wellesley, 1st Duke of, K.G.,
C., G.C.B. (1769–1852), was the most famous
itish general of the 19th century. He dis-
guished himself in India and conducted
ccessfully the Peninsular War. In 1814
was British Ambassador at Paris. Then
me Napoleon's escape from Elba, the short
d sharp campaign which terminated at
aterloo, and the final overthrow of Napoleon.
ellington became the most prominent man in
e Empire. From 1828 to 1830 he was Prime
inister. From 1842 to his death he was
ommander-in-Chief. His funeral at St. Paul's
s one of the great pageants of last century.
s, Herbert George (1866–1946), English nove-
t, sociologist and reformer, one of the most
eative and influential writers of his time, a
n with a passionate faith in progress through
ence. His long series of books included
mances of the Jules Verne variety (*The Time
achine*, *The Island of Dr. Moreau*, *The In-
ible Man*), sociological autobiography (*Love
d Mr. Lewisham*, *Kipps*, *Tono-Bungay*, *The
story of Mr. Polly*, *Mr. Britling Sees it
rough*), and popular education (*Outline of
story*, *The Science of Life*, *The Work, Wealth,
d Happiness of Mankind*, *The Shape of
ings to Come*, *The Fate of Homo Sapiens*).
s great attempt at educating the common
n proved so successful that his imitators
ve been legion. He was a founder member of
e Fabian Society.
ey, Charles (1708–88), brother of John Wes-
, and the poet of Methodism. Wrote a large
mber of hymns of enduring merit.
ey, John (1703–91), the founder of the great
igious communion of the people called
Methodists," and the son of a clergyman of
e Anglican church. Taking orders himself, in
35, he went to Georgia as a missioner and
ied himself with the Moravians, but later he
andoned all ecclesiastical traditions, and
ablished, on a wonderfully well-devised basis,
e connexion called by his name. His own
en-air preaching was powerful in the extreme,
energy and depth of purpose inspiring, and
organising ability exceptional. He accom-
shed a great work of religions revivification,
ing the world as his parish; and profound as
s his conviction of his high calling as an
angelist, John Wesley " builded better than
knew " in rearing the denominational edifice
ich is the monument of his faith and vigour.
e *also* **Methodism, Section J.**
, Rebecca, D.B.E. (Mrs. Cicily I. Andrews)
1892) novelist, critic and journalist. Among
books are *Black Lamb and Grey Falcon* (a
vel book and commentary on Yugoslavia,
2), *The Fountain Overflows*, 1957, and *The
rds Fall Down*, 1967.
ermarck, Edward Alexander, Ph.D. (1862–
9), a distinguished Finnish scientist who was
ofessor of Sociology at the University of Lon-
, 1907–30. Born at Helsingfors, he made an
ernational reputation with the monumental
story of Human Marriage, written in English
d published in 1891. His many other works
lude *Origin and Development of the Moral
as*, 1906–8, *A Short History of Marriage*,
6, and *The Oedipus Complex*.
inghouse, George (1846–1914), American en-
eer who built the dynamos for Niagara Falls,
d in 1865 invented the compressed air brake
own by his name and developed a compressed
system of railway signalling.
macott, Sir Richard, R.A. (1775–1856), a
at English sculptor who studied under Canova
Rome, and succeeded Flaxman as Professor
at the Royal Academy. He executed many fine monuments in Westminster Abbey, at St. Paul's Cathedral, and elsewhere, including the statue of Achilles in Hyde Park and the pediment of the British Museum.

Wharton, Edith (Jones) (1862–1937), American novelist whose *House of Mirth* (1905) brought her fame as a social satirist. Her work was greatly influenced by her friend Henry James, and most of her fifty-four volumes were written after she was thirty-five.

Whately, Archbishop Richard (1787–1863), was for over thirty years Archbishop of Dublin, and achieved a high reputation as a writer on theology and philosophy. His treatises on *Rhetoric* and *Logic* are among the most notable books of their class.

Wheatstone, Sir Charles, F.R.S. (1802–75), was an eminent English electrician and scientist, whose experiments in association with Mr. W. F. Cooke resulted in the first application in this country of the principle of the electric telegraph. The stereoscope was also one of his inventions. He was Professor of Natural Philosophy to King's College, London, for many years.

Wheeler, Sir Charles, K.C.V.O., C.B.E., P.R.A., F.R.B.S. (b. 1892), British sculptor; P.R.A., 1956–66.

Whistler, James Abbott McNeill (1834–1903), was an original artist, writer, and wit, who first came to Europe from America in 1857, and made a name as an etcher both in Paris and in London. His studies of Thames scenery are especially fine. When he began to exhibit pictures in oils he greatly puzzled the critics, some of whom discovered in his " nocturnes " and other studies an impressionist of surpassing genius, while others, including Mr. Ruskin, who described one of the " nocturnes " at the Grosvenor Gallery as a " pot of paint flung in the public face," looked upon them as mere audacious eccentricities. The finest of his oil paintings are the portrait of his mother, and that of Carlyle. He brought an action against Ruskin for the criticism referred to, but only obtained a verdict of one farthing damages without costs.

White, Field-Marshal Sir George Stuart, V.C., G.C.B., O.M., G.C.M.G., G.C.I.E., G.C.V.O. (1835–1912), the heroic defender of Ladysmith in the South African War and a soldier who achieved renown at many points of a long military career.

Whitefield, George (1714–70), was for a time associated with John Wesley at Oxford in the propagation of Methodism and attracted great attention by his gifts as a preacher. He was Wesley's most powerful champion; but in 1741, differing from Wesley on a point of doctrine he left the Methodists, and thenceforward simply preached as an evangelist, allying himself with no sect, but expounding Calvinistic doctrines with fervour and eloquence.

Whitgift, John (1530–1604), a gifted Anglican prelate. Persecuted the Puritans, and was one of the authors of the famous *Lambeth Articles*. Was Archbishop of Canterbury 1583–1604.

Whitman, Walt (1819–92) was an original figure in the world of American authorship, and produced many works of striking poetic merit. He served in the Civil War, and his vigorous humanity, as expressed in his writings, made him a distinguished personality. His works include *Leaves of Grass*, *Drum Taps*, and *Democratic Views*.

Whittier, John Greenleaf (1807–92), America's Quaker poet, was the son of a New England farmer, and for a time followed the trade of a shoemaker. After some experience in journalism, he published his first book of poems, *Legends of New England* (1831). His best-known volumes are: *Lays of My Home* (1843), *Voices of Freedom* (1846), *Songs of Labour* (1850), and *National Lyrics* (1865).

Whittington, Richard (*c.* 1358–1423), the son of a Gloucestershire knight, Richard became a wealthy London mercer and was three times mayor of London, 1397–98, 1406–7, 1419–20. His wealth enabled him to supply large loans to Henry IV and Henry V. He was well styled " the model merchant of the Middle Ages ". His fortune he bequeathed to charitable institutions. The famous legend about him lacks historical evidence, the " cat " story being a familiar theme in the folklore of almost all the nations of Europe.

Whittle, Air Commodore Sir Frank, K.B.E., C.B. (b. 1907), pioneer in the field of jet propulsion. The first flights of Gloster jet-propelled aeroplanes with Whittle engine took place in May 1941.

Whymper, Edward, F.R.S.E. (1840–1911), a wood-engraver and artist; also one of the best-known Alpine climbers, and the first to reach the summit of the Matterhorn. Author of books on mountaineering in various countries.

Wiggin, Kate Douglas (Mrs. George C. Riggs) (1856–1923), an American novelist of quaint charm and humour. Author of *Rebecca of Sunnybrook Farm.*

Wilberforce, William (1759–1833), was the son of a Hull merchant. He was educated at Cambridge, and entered Parliament in 1780. In 1789 made the first of his many proposals in the House of Commons for the abolition of the slave trade, but it was not until 1807 that the Act embodying these proposals was carried.

Wilcox, Mrs. Ella Wheeler, a popular American poetess (1855–1919). Writer of sentimental verse.

Wilde, Oscar Fingall O'Flahertie Wills (1854–1900), Irish author and dramatist, son of Sir William Wilde, a Dublin surgeon; leader of the cult art for art's sake. His works include poems, fairy-tales, short stories, and brilliantly witty comedies, *Lady Windermere's Fan, A Woman of No Importance, The Ideal Husband* and *The Importance of Being Earnest.* In 1895 he brought an action for libel against the Marquess of Queensberry, the father of his friend, Lord Alfred Douglas, but he himself was convicted of homosexual practices and sentenced to prison for two years where he wrote his famous poem, *The Ballad of Reading Gaol.*

Wilder, Thornton Niven (b. 1897), American author and playwright. Among his books are *The Bridge of San Luis Rey* and the *Ides of March.*

Wilkes, John (1727–97), a forceful and daring Whig politician who championed the cause of the people with great vigour. For a violent attack on George III's Government in his paper *The North Briton,* he was committed to the Tower, but obtained release on the ground that he was a member of Parliament. He was later expelled from the House and fled to France. He returned in 1768 and was repeatedly elected M.P. for Middlesex and as often denied his seat. A great agitation ensued, and so high was he in favour among the people, that he was made alderman, then sheriff, then Lord Mayor of London. In the end his opponents gave way, the orders against him were withdrawn, and from 1779 he was Chamberlain of the City of London.

Willcocks, Sir William, K.C.M.G. (1852–1932), a British engineer, born in India, who in 1898 planned the great Aswan Dam, which he completed in 1902. In 1911 he undertook for Turkey a vast scheme for irrigating some 31 million acres in Mesopotamia.

Willett, William (1856–1915), an English builder, noted for his long and tireless advocacy of the Daylight Saving scheme, which, however, he did not live to see put into effect. It was adopted as a war-time measure in the year following his death. (*See* Summer Time, Section L).

William I. (1027–87), the "Conqueror," Duke of Normandy, claimed the English throne as legally appointed successor to Edward the Confessor and, at the Battle of Hastings in 1066, defeated Harold II. who was killed. The new king crushed Saxon resistance in the North and West, transferred most of the land to his Norman followers, and drew England into closer relations with the Continent. Maintaining many old institutions such as the shire-court and the fyrd (a non-feudal army), William governed firmly, and was supported by the Church, especially by Lanfranc, Abp. of Canterbury. In 1085 he ordered the Domesday Survey (*q.v.*).

William I. of Prussia (1797–1888), the maker of modern Germany, succeeded to the throne of Prussia in 1861. It fell to him to have the control of his country during a period of mighty transition and development, with Bismarck as his chief minister. The war wi
Austria rendered him highly popular, ar
when in 1870 the war with France was entere
upon the whole German people rallied rou
him, and after a series of brilliant achievemen
by his army he was proclaimed German Er
peror on the 18th of January, 1871.

William II. (1056–1100), the Conqueror's so
surnamed "Rufus," King of England from 10
to his death. Was in constant conflict with h
barons, lived a life of wanton pleasure, was o
pressive to his subjects, and was shot (by ac
dent or design) while hunting in the New Fore

William II., the Kaiser (1859–1941), King
Prussia and German Emperor 1888 until
abdicated Nov. 9, 1918, and fled to Hollan
where he was subsequently interned in the cast
of Doorn, living there in complete retireme
until his death in June, 1941. Educated
Cassel and Bonn, afterwards entered the arn
and took a keen interest in military affai
Succeeded his father, the Emperor Frederick,
1888. His reign was marked by a strong mi
tarism and an intense ambition to secure t
dominance of Germany in the Councils of Euro
—an ambition which contributed to the ou
break of the first great war in 1914.

William III (1650–1702), King of England, Sco
land, and Ireland (1689–1702), son of William
of Orange (1626–50) and Mary (1631–6
daughter of Charles I. He married Mary, elde
daughter of the Duke of York (later James I
while Stadtholder of Holland. As captai
general of the Dutch forces he was successf
against the French, and in 1688, when Jam
had abdicated and fled the country, William w
invited to succeed him and he and Mary afte
wards became joint King and Queen. Later
was at war with France, and suffered defeat
but ultimately effected an honourable peace
the Treaty of Ryswick in 1697.

William IV of England (1765–1837) was the thi
son of George III., and ascended the throne
1830 in succession to his brother, George I
He had seen some sea service, and was flatte
ingly styled the "Sailor King." He show
little of kingly capacity, he was genial a
pleasure-loving, and placed no obstacles in t
way of government, so was, after a so
popular. In the early part of his reign (183
the first great Reform Bill was passed.

William the Silent (1533–84), Prince of Orang
made many attempts to secure a peace
settlement of Netherlands' disputes wi
Philip II, but became the leader of the ensui
Revolt and was assassinated. He establish
the independence and Protestant character
the Northern Netherlands, where litera
artistic, colonising, and commercial activi
flourished in the following century.

Williams, Sir George (1821–1905), the founder
The Young Men's Christian Association.

Williams, (George) Emlyn (b. 1905), Welsh act
playwright, and producer, who has had gre
success in numerous plays and films, a
latterly in his readings from Dickens and Dyl
Thomas. Author of *Night Must Fall, The Co
is Green,* and *The Light of Heart.*

Wilson, Rt. Hon. (James) Harold, O.B.E., M.
(b. 1916), British statesman and economi
Prime Minister 1964–; elected Leader of t
Labour Party after the death of Gaitskell
1963; Labour M.P. for Ormskirk, 1945–50; f
Huyton, 1950–; Pres. of the Board of Tra
1947–51; Chair. Public Accounts Committ
1959–63. *See also* Section C, Part II.

Wilson, Richard, R.A. (1714–82), a landscape a
portrait painter.

Wilson, (Thomas) Woodrow (1856–1924), Preside
of the United States 1913–21. Was Governor
New Jersey, 1912–13. In 1916 secured from t
Kaiser a promise to abandon the more inhum
forms of submarine warfare, and, on th
resumption in 1917, broke off official relatio
with Germany and proclaimed a state of w
Entered into the conflict with the utmost vigo
bringing the full military and financial resour
of the Republic into play against Germa
Was a great factor in the winning of vict
and in the concluding of a just peace. Larg
responsible for the setting up of the League
Nations, which was foreshadowed in
famous Fourteen Points.

gate, Major-Gen. Orde Charles, D.S.O. (1903–
), the leader of the Chindit forces engaged
hind the Japanese lines in Burma during the
cond world war. Killed in an air crash.

fred, St., patron saint of virgins, a Welsh
aiden, who was beheaded by Prince Caradoc
treating him with scorn.

eman, Nicholas Patrick Stephen, Cardinal
302–65), the first R.C. Archbishop of West-
inster, created Cardinal. Much of his life was
ent in the reorganisation and development of
e Roman Catholic Church in Great Britain.
e was one of the three great R.C. prelates of
e nineteenth century, the other two being
anning and Newman.

ehouse, Pelham Grenville (b. 1881), English
morist, creator of the inimitable Jeeves in the
ertie Wooster stories.

, Friedrich August (1759–1824), a great
erman scholar, regarded by some as the
under of scientific classical philology.

, Hugo (1860–1903), Austrian song-writer.
his settings of over 300 German lyrics, includ-
g many of Mörike and Goethe, he achieved
mplete union of poetry and music.

e, General James (1727–59), commanded the
ritish forces in Canada at the siege of Quebec,
here he won a brilliant victory, which cost
m his own life.

sey, Cardinal Thomas (*c.* 1473–1530), was the
n of an Ipswich butcher. Showing ability,
was sent to Oxford to be educated, later
entering the Church, where he gradually
se to a position of eminence, and was entrusted
th several diplomatic missions. He was espe-
lly favoured by the King, Henry VIII., and
cured rapid preferment under that monarch,
ing in turn Bishop of Lincoln, and Archbishop
York. He was subsequently made Cardinal
d became Henry's Chancellor. For a number
years he was supreme, and by his diplomacy
d much to strengthen the kingly power. But
hen Wolsey was unable, though willing
ough, to obtain the papal sanction for Henry's
vorce of Catherine, he fell into disfavour,
d his decline was rapid indeed. From being
great personage, with a princely entourage,
was humbled, persecuted, and harried, and
ed at Leicester Abbey a broken, dejected man.

d, Sir Henry Joseph, C.H. (1869–1944), was
e most popular English musical conductor of
s day. He introduced many works and com-
sers previously unknown to the British public
d greatly stimulated and encouraged interest
classical music. His long association with
e Promenade Concerts began in 1895 at the
ueen's Hall, and after it was destroyed in an
r raid in 1941 the concerts continued at the
bert Hall and are now named after him. He
mposed songs and cantatas, and his arrange-
ent of sea shanties ends every series of
omenade Concerts.

dcock, George (b. 1904), succeeded Sir Vincent
ewson as secretary of the T.U.C. in 1960.
on scholarships to Ruskin College, Oxford,
d Oxford Univ. and gained first-class honours
philosophy, politics, and economics. Ap-
inted research officer of T.U.C. in 1936 and
sistant general secretary in 1947.

dville, Elizabeth (1437–91), wife of Sir John
rey. After her first husband's death she
ade a secret marriage with Edward IV., and
came the mother of Edward V., and his
other Prince, both of whom were put to death
the Tower by order of Richard III. She was
o mother to Elizabeth, Queen of Henry VII.

lf, Mrs. (Adeline) Virginia (1882–1941),
nglish novelist and essayist, daughter of Sir
slie Stephen and wife of Leonard Woolf,
iter and publisher. Together they formed
e Hogarth Press. Among her best known
orks are *To the Lighthouse*, *Mrs. Dalloway*, *The
aves*, *The Years*, *A Room of One's Own*, *Orlando*.

lley, Richard van der Riet, Sc.D., F.R.S. (b.
06), succeeded Sir Harold Spencer Jones as
tronomer Royal at the Royal Greenwich
oservatory in 1956; formerly Commonwealth
tronomer at the Observatory at Canberra.

tton, Barbara Frances, Baroness, M.A.,
H.D., J.P. (b. 1897), Prof. of Social Studies,
niv. of London, 1948–52. Chair. Metropolitan
venile Courts. Her book *Social Science and
cial Pathology* (1959) examines the state of our knowledge about social pathology, with particular emphasis on criminology and social work. Her *Autobiography* was published in 1967. Created a life peeress in 1958.

Wordsworth, William (1770–1850), the chief of the "Lake Poets," and one of the most inspired of all British bards, was a native of Cockermouth, and was educated at Hawkshead and St. John's College, Cambridge. In association with Coleridge he issued a volume of *Lyrical Ballads* in 1798. The following year saw him settled at Grasmere, and there and at Rydal Mount he passed the rest of his days. In 1802 he married Mary Hutchinson, his cousin, and the two, with the poet's sister Dorothy, formed an ideally poetic household. Here he carried out his creed of "plain living and high thinking," and produced at intervals some of the purest and noblest poetry in the language. As an interpreter of Nature in her many moods he stands unrivalled. Succeeded to the Poet Laureateship on the death of Southey in 1843.

Wren, Sir Christopher, F.R.S. (1632–1723), the most famous English architect of his time. He did not quite have all his own way with the tremendous thirty-five years' task he accepted in undertaking the reconstruction of St. Paul's after the Fire, but he produced a masterpiece of which Britain may well be proud. Chelsea and Greenwich Hospitals, and a number of London's finest churches were also his work.

Wright, Sir Almroth (Edward), K.C.B., C.B., M.D., F.R.S. (1861–1947), discovered the system of anti-typhoid inoculation, the method of therapeutic inoculation for bacterial infections (vaccinotherapy), and methods of measuring the protective substances in human blood.

Wright, Frank Lloyd (1869–1959), American architect who, with others, brought into fashion the present-day horizontal strip and all-glass design. His imaginative ideas, both as to structure and look, have influenced architecture all over the world. Early buildings were the Larkin office building, Buffalo, N.Y., and the Imperial Hotel, Tokio, which withstood the 1923 earthquake. His last building was the Guggenheim Museum in New York, based on a spiral.

Wright, Orville (1871–1948), American airman who, with his brother **Wilbur** (1867–1912), began gliding experiments on the sand dunes at Kitty Hawk, North Carolina. To the glider they built they added a petrol engine, and on 17th Dec., 1903, they made four flights, the longest being 852 ft. These flights were the first in which a man had been carried from the ground in sustained, controlled flight in a powered heavier-than-air machine.

Wyatt, James, R.A. (1746–1813), a celebrated architect in his day. He built Fonthill Abbey for Beckford and the Royal Military Academy at Woolwich. Pres. of R.A. 1805–6.

Wyatt, Sir Thomas (1503–42), was the first writer of English sonnets, and a poet who did much to develop the earlier forms of verse.

Wyatt, Sir Thomas ("The Younger") (*c.* 1520–54); joined with the Duke of Suffolk in favour of Lady Jane Grey and against Queen Mary, son of the last-mentioned. Led the men of Kent in rebellion on London in 1554, but was captured and executed.

Wycherley, William (1640–1715), English Restoration dramatist, a master of satiric comedy. His plays include *Love in a Wood*, which won him the favour of the Duchess of Cleveland, mistress of Charles II, *The Plain Dealer*, and his masterpiece *The Country Wife*. His marriage to the Countess of Drogheda lost him court favour.

Wyclif, John (*c.* 1324–84), born in Yorkshire, educated at Oxford, and one of the most eminent ecclesiastics of his time. He adopted principles many of which became general at the Reformation, and brought down upon himself the bitter enmity of the Roman Catholic leaders, and would probably have been put to death but for the protection of John of Gaunt. While in comparative retirement as Rector of Lutterworth, in Leicestershire, he finished his translation of the Bible.

Wykeham, William of (1324–1404), was Bishop of Winchester from 1366 to his death, and from 1367 to 1371 Lord Chancellor. He was a man of great learning and an excellent preacher, and wielded great influence. He founded New

College, Oxford, in 1379 and Winchester College in 1382.

Wyllie, William Lionel, R.A. (1851–1931), English marine painter whose *The Thames Below London Bridge* was bought by the Chantrey Bequest.

Wyspianski, Stanislav (1869–1907), great Polish poet, dramatist and painter.

X

Xavier, St. Francis (1506–1552), the apostle of the Indies, was the follower of Ignatius de Loyola, and devoted his life to missionary work in the East. He was canonised in 1622.

Xenophon (444–359 B.C.), the Athenian general and follower of Socrates. His chief works are *Anabasis Hellenica*, and *Cyropædia*.

Xerxes (*circa* 519–465 B.C.), King of Persia, was the son of the first Darius and a great commander. In 481 B.C. he started on his famous expedition against Greece when, according to Herodotus, he had a combined army and navy of over two and a half million men. He defeated the Spartans at Thermopylae, but his fleet was overcome at Salamis. He reigned from 485 to 465 B.C. and met his death by assassination.

Ximenes de Cismeros, Francisco (1436–1517), Spanish statesman and Cardinal who reformed the Franciscan Order to a great extent, and in 1502 began to direct the preparation of a polyglot bible, the *Complutensian*, which greatly influenced subsequent versions. In 1506 was made Regent for Queen Juana, and raised to the cardinalate in 1507. Personally conducted a military campaign in Africa in 1509, and afterwards became Inquisitor-General, and in 1516, Regent of Castile, but in the following year was dismissed by the Emperor Charles V.

Y

Yeats, William Butler (1865–1939), Irish lyric poet and dramatist and major figure in the Irish literary revival of the 20th century. With Lady Gregory and others founded the Abbey Theatre in Dublin, for which he wrote many plays. Interested in mysticism and the occult. Member of the Irish Senate, 1922–28; awarded Nobel Prize in Literature in 1923. Some of his best work was written in his later years in *The Tower* (1928) and *Last Poems* (1940). Plays include *Cathleen Ni Houlihan* (1902), *The Hour Glass* (1904), *Deidre* (1907).

Yonge, Charlotte Mary (1823–1901), author of over 120 novels, school books, and other works, including *The Heir of Redclyffe*, *The Daisy Chain*, *The Dove in the Eagle's Nest*, and *The History of Christian Names*.

Young, Brigham (1801–77), Mormon leader, and head of the Latter Day Saints of Salt Lake City. At his death he had seventeen wives.

Young, Francis Brett (1884–1954), British novelist. His books include *My Brother Jonathan* and *Doctor Bradley Remembers*.

Young, James, F.R.S. (1811–83), a Glasgow chemist who discovered the method of distilling oil from shale, and founded the mineral oil industry of Scotland, which led to the development of petroleum concerns.

Young, Thomas (1773–1829), one of the most versatile geniuses in history, descended from a Quaker family of Somerset. Studied languages, medicine, and held the Professorship of Physics at the Royal Institution. In 1804 elected Foreign Secretary of the Royal Society. He was very successful in deciphering Egyptian hieroglyphics and was the first to translate the inscription on the Rosetta Stone. Famous for his share in establishing the undulatory theory of light and for his work on physiological optics.

Younghusband, Lt.-Col. Sir Francis Edward, K.C.S.I., K.C.I.E. (1863–1942), soldier, explorer and writer. Wrote many works on the East. Headed the British Mission to Tibet, 1903–04. Was *Times* correspondent with the Chitral expedition. Pres. of Royal Geographical Soc., 1919–22.

Ypres, 1st Earl of, P.C., K.P., G.C.B., O.M., G.C.V.O., K.C.M.G. (1852–1925), entered Navy in 1866, afterwards passing into Army in 1874, making his mark as a Cavalry officer in the
Egyptian campaign of 1884; served in Sou
African War with brilliant success. C.-in-
British Forces in France, 1914–15; C.-in-
Home Forces, 1915–18; Lord Lieut. of Irelan
1918–21.

Ysayë, Eugène (1858–1929), Belgian violinist ar
conductor, noted chiefly for his playing of t
works of Bach and César Franck.

Yukawa, Hideki (b. 1907), Japanese physicist, wh
received the 1949 Nobel Prize for predicting t
existence of the meson.

Z

Zadkiel (the angel of Jupiter in Jewish rabbini
lore) was the name assumed by Lilly (1602–8
the astrologer, and also by Richard Jam
Morrison (1794–1874), Hebrew scholar ar
amateur astronomer, in the almanack known
Zadkiel's Almanack and first issued in 1831.

Zadkine, Ossip (b. 1890), French sculptor, one
the greatest of our time, whose works inclu
Orpheus, The Return of the Prodigal Son, T
Birth of Forms, Poet, Harlequin. Exhibition
Tate Gallery, 1961.

Zaharoff, Sir Basil, G.C.B., G.B.E. (1849–193
was an influential Greek banker and financi
who became an armaments magnate, supplyi
the Allies in the first world war.

Zamenhof, Ludwig Lazarus (1859–1917), Poli
linguist who was by profession an oculist, b
gained fame as the inventor of Esperanto.

Zeno of Citium (*c.* 340–264 B.C.) was a Gre
philosopher who founded the Stoic system.

Zeppelin, Ferdinand, Count von (1838–1917),
ventor of the huge dirigible airship bearing
name. His first ascent was in 1900. He orga
ised a Zeppelin service for the German army
the war of 1914–18, but their extreme vulner
bility militated severely against their usefulne

Zeromski, Stefan (1864–1925), great Polish nov
list, poet and playwright.

**Zhukov, Marshal of the Soviet Union Grigo
Konstantinovich** (b. 1895), led the defence
Moscow and Leningrad during second wor
war; served on Allied Control Commission
Germany; C.-in-C. Land Forces and Depu
Minister of Armed Forces of Soviet Uni
1946–55; succeeded Marshal Bulganin
Defence Minister, 1955–57.

Zhukovsky, Vasily Andreyevich (1783–18
Russian poet whose original work had ve
important influence on Russian literature.

Zola, Emile Edouard Charles Antoine (1840–19
was the son of an Italian engineer, and ca
before the public as a novelist in 1867 wi
Thérèse Raquin. He then conceived the idea
a series of novels which should depict the histo
of a Second Empire family in various realis
phases, and began the series with *La Fort*
des Rougons, in 1871. In 1877 he made a hig
success by *L'Assommoir.* From that time eve
novel he published had an immense sale.

Zorn, Anders Leonhard (1860–1920), was a not
Swedish painter, etcher and sculptor.

Zoroaster, the Greek form of the name of
Persian prophet, Zarathustra, who lived ab
the seventh century B.C. He was a monothe
believing in a good and holy God whom
called Ahura Mazda. Many of his teachi
were absorbed by the ancient Persian relig
which survives today among the Parsees in Ind

Zoshchenko, Mikhail (1895–1958), Russian wri
whose humorous short stories, satirising
Soviet way of life, were wildly popular throu
out Russia in the 1920s. Several have be
translated and published in England.

Zosimus (fl. c. A.D. 300), the first known alchemi
He lived in Alexandria.

Zuccarelli, Francesco (1702–88), a very celebra
Italian artist, who came to England, succeed
made a handsome fortune, and was one of
first membersof the Royal Academy.

Zuckerman, Sir Solly, C.B., M.A., M.D., D.
F.R.S. (b. 1904), British biologist; Prof.
Anatomy, Birmingham Univ., 1939–; c
scientific adviser to the Government and h
of the Government's scientific service.

Zwingli, Ulrich (1484–1531), was one of the ab
of the Swiss Reformation leaders.

Zwirner, Ernst Friedrich (1802–61), an emin
Silesian architect. Restored Cologne Cathed

BACKGROUND TO PUBLIC AFFAIRS

section is in two parts. The first describes some major events since the war and carries the story 967. The second part describes our own political institutions, the Commonwealth, the United ons and Western International Organisations.

I. STORY OF POST-WAR EVENTS

BRITAIN: POLITICAL BACKGROUND.

e End of Another War.—The way the British le greeted the end of the Second World War markedly different from their feelings in 1918. First World War had ended almost as sud- y as it had begun; and there was then an ex- on of relief and rejoicing of a kind which has been seen since. After all, that was a " war nd war." It could never happen again. and was to be a land " fit for heroes to live in." outbreak of the war in 1914 had been a sudden k to a world confident of peaceful evolution. British people, having seen it through, were confident that nothing like it could recur. instant reaction when the end came was efore one of delirious relief. The mood at the of the last war, however, was very different. war came gradually but relentlessly all ugh the 'thirties and it ended gradually too. vere in a sense at war long before it formally ed; and at the end there was no clear gence into a cloudless era of assured peace progress. To maintain peace a continuous t was seen to be necessary. Ideas had played ch greater part in sustaining men and women e second great war than in the first; their of responsibility had grown so that the mood the end came on 8 May 1945 was more tioning and cautious than in November 1918. her, the second great war had touched every- more directly—the bombing of cities, the nence of invasion, the food shortages, the uation of school children, all this had spread mpact; and, when it was over, the mood was f sober resolve.

e Age of Bewilderment.—Before we continue narrative let us take a backward glance at ears between the wars, not to describe the s, which included the emergence of authori- n tyrannies and a world-wide economic crisis, o mark some of the moral characteristics. s said to be a period of disillusionment, of l and intellectual decay. There was the loss th in democracy; a sense of aimlessness re- d in the arts, a good deal of confusion and tainty about values, and, above all, in- ity. That there was this political apathy bewilderment is true; but much to the con- is true also. This was, after all, the nation had won the war and, by resolution and was to win the next. The nation faces lties again. We shall see later that these lties seem hard to diagnose but we shall try entangle in this story the elements in what een called our social malaise.

First Atomic Explosion.—Momentous events to come. The war with Japan was not yet Although the secret was kept at the time, rst full-scale atomic bomb explosion was in the Mexican desert in July 1945 through ncerted efforts of a team of scientists work- America. The bomb was detonated at the a pylon 100 feet high and a space of ten cleared. Devastation inside a one-mile was absolute. It offered a means to a end of the war with Japan. It has proved the first of a series of tests of increasingly ful bombs which pose the greatest threat has ever faced mankind and may yet civilisation. A few days later the United States and Great Britain called for unconditional surrender by Japan and upon its rejection a bomb was dropped on August 6 on Hiroshima and a second on Nagasaki on August 9. The surrender terms were then accepted. Churchill in his account of the war describes his own view that there should have been no rigid insistence on "unconditional surrender." "It would be a mistake", he writes, "to suppose that the fate of Japan was settled by the atomic bomb. Her defeat was certain before the first bomb fell."

The Face of the Post-war World.—Far-reaching changes mark the decade which ended with the Suez affair of 1956. Asian countries, driving towards independence, reached their objectives, and a similar drive in African countries was gathering momentum. The war had impoverished Britain and France, which could no longer be powers great enough to follow an independent course; and they both played rôles, although different ones, in launching Western Europe towards unity. The victors of the war quarrelled and this vitiated the working of the United Nations, which had been founded on the hope that the victors would not quarrel—not, at any rate, so profoundly that we should no longer have a state of peace but a condition given the frank but dispiriting title of "the cold war." The direct confrontation of the two great Power blocs—the United States and the Soviet Union—was therefore a cardinal feature of the decade, with the development of atomic weapons. The competition in armaments was matched by another competition in economic power. Both sides made a bid for the support of the new Afro-Asian countries; and it was seen that what attracted those countries was naturally the technical means to satisfy hunger and to secure clothing, shelter, and the materials with which to live. Russia, therefore, turned increasingly to the training of scientists and technologists in the drive towards industrialisation and economic growth, likely to comfort the peasantries of the new continents.

Estrangement between West and East.—The war had engendered friendship between Western Powers and Russia. Why did they so quickly fall apart with the defeat of the enemy—a fact which was to transform the history of the world? The fact was that relations were reverting to their pre-war state of hostility. Nazi Germany had divided the West from Russia; Russia had been suspicious of our appeasement of Germany which might liberate her for attack eastwards. And when, eventually, Russia and Germany signed a non-aggression pact in 1939, which freed Germany to turn west instead of east and to attack us, our hostility towards Russia naturally deepened. Popular feeling changed when Hitler invaded Russia in 1941 but co-operation between Western and Soviet leaders was not so close as to prevent ill-feeling—one cause of mistrust being the Russian belief that our invasion of Europe was being unjustifiably delayed. When the war ended there was still an abundance of goodwill towards Russia. But a number of political facts worked the other way. The Russians had taken a hold over a number of countries in the eastern half of Europe; and this led to the establishment in those countries of communist régimes. Were the ideas of

Russia necessarily antagonistic to the West? They were certainly incompatible. In Stalin's view, especially after his experience of Germany's invasion, there could not but be hostility from the West. This sense of suspicious defensiveness made Soviet foreign policy complex and enigmatic. Whatever the reason might be, Russia's policy followed a course which could not be easily understood; and the goodwill towards her was allowed to evaporate.

The Bomb.—In the first years of the decade the Red Army was supreme on the ground in Europe and Asia and the U.S. Air Force supreme in the air. It was the Red Army versus the atomic bomb. But in September 1949 the Soviets exploded an atomic bomb and the four years of American monopoly was over. The race for bigger bombs intensified. The United States exploded a hydrogen bomb in November 1952 and Russia followed in August 1953. The new weapon was different not only in degree but in kind. The killing effects were incalculable; and the after-effects on future generations unpredictable. Eisenhower said there was no alternative to peace; but no solution was reached on practical issues—on the two Germanys, on the status of the satellite countries in Eastern Europe, on the future of the Middle East. The post-war world disintegrated. Neutralism was seen as the only hope of survival by those countries where pent-up forces of nationalism were being released.

The Technological Race.—The race between Russia and the West was not a new one; Professor Toynbee has pointed out that it began in 1700 when Peter the Great created a strong country against invaders who had deprived her earlier of so much. Russia, defeated in the first great war, made a new start in 1917 when she threw communism (a creed borrowed from the West) into the scale. She drew ahead and after a long and bitter struggle beat the Germans in 1945 as Peter the Great had driven Russia ahead, eventually beating the French in 1812. With the American success with the atomic bomb Russia fell behind again; but she resumed the race with the West and was first with an earth satellite (1957) and a manned satellite (1961). In their technological breakthrough in 1957 the Russians developed the first inter-continental ballistic missile. The see-saw continued and, in 1961, the Americans perfected the cheap, quickfiring ICBM, the Minuteman.

The Creation of the "Satellite" States.—The satellite states, as they are known, were set up by Russia in the countries of Eastern Europe which had been occupied by Russia in the final stages of the war. This occupation had been made militarily easier when the Americans, in August 1944, had withdrawn 100,000 men from the Italian campaign for a seemingly needless invasion of the south of France. The states were Czechoslovakia, Poland, Roumania, Albania, Hungary, Bulgaria, and Yugoslavia—all, except Hungary, inhabited by peoples mainly of Slav race. Yugoslavia, however, eventually broke away under its national leader, Marshal Tito, though the country remained communist. At the Yalta conference of February 1945 attended by Roosevelt, Churchill, and Stalin, Russia had agreed that democratic governments should be set up in Eastern Europe. But the transformation of the countries to Communist régimes began very shortly afterwards and by 1948 was complete.

The Cold War and the West.—The failure of the nations to make treaties of peace or arrangements for general disarmament, and the continuing loss of confidence between Russia and the West led to an increase of armaments and defensive pacts by both sides. In the West rearmament was carried out by the U.S.A. and Western Europe on the lines of an agreement made in 1949 and known as the North Atlantic Pact. They formed the North Atlantic Treaty Organisation (NATO), the first supreme commander being Eisenhower, who afterwards became, for two terms, President of the United States (being su ceeded by Kennedy in 1961). The Russians, their side, organised the Communist countries a "Warsaw Pact." It is refreshing to note th Austria, by agreement in 1956, established democratic republic, to be permanently neut like Switzerland. In Asia a number of countr which met at Bandung in Indonesia in 1955 w some African countries decided to keep neutr Four Asian countries, however (Turkey, Iraq, In and Pakistan), neighbours of Russia, formed defensive pact with Britain—the Baghdad Pa (later to become the Central Treaty Organisati or CENTO). Some countries bordering the Ea and South Pacific, including Australia and N Zealand, formed the South East Asia Trea Organisation or SEATO for mutual defer against the Communists.

The General Election of 1945.—This electi was quiet, conducted on an out-of-date regis but with a postal vote for the Forces. A live issue had been introduced by Churchill, who clared that if the Labour Party won the electi Attlee, as Prime Minister, would be under control of Harold Laski who was then chairman the national executive of the Labour Party. T declaration stemmed from a statement which h been made by Laski that the Labour Party wou not be bound by any commitments entered i by Attlee when, as leader of the Labour Party, accompanied Churchill to the Potsdam conferen with Stalin and Truman in June. A correspo dence of increasing bitterness followed betwe Churchill and Attlee who asserted "The Chairm has not the power to give me instructions." Att seemed on surer ground in the interpretation the constitution of his own party. The popu impression was that the matter was an electi scare devised by Churchill's campaign advise The Labour Party had a dramatic victory, 3 Labour M.P.s being returned, with a clear major over all other parties. They did not have a cle majority among the voters, the Liberals holdi a balance. But the bias present in the cons tuency system worked in favour of the Labo Party.

The Resignation of Churchill.—Ordinar Churchill might have been expected to take a f days to wind up the affairs of the Governme This would have enabled him to present the u conditional surrender of Japan to the natio But two factors led him to resign at once a advise the King to send for Mr. Attlee. The factors were the need for Britain to be represent with proper authority at the Potsdam conferen where great issues were coming to a head; and t overwhelming nature of the verdict of the electo He thanked the nation that day for the "unflinc ing, unswerving support" which they had giv him in his task in the war and "for the many pressions of kindness which they have shown wards their servant."

Churchill's Premonition.—There is a movi story in the last volume of Churchill's work *Second World War* of his sudden premonition electoral defeat. On 25 July 1945 he flew ho from Potsdam and went to bed, accepting view of the Conservative Party managers that British people would wish him to continue work and that it would be possible to reconstitu the National Coalition Government in the p portions of the new House of Commons. On th belief he slumbered. "However, just bef dawn," he writes, "I woke suddenly with sharp stab of almost physical pain. A hithe subconscious conviction that we were beat broke forth and dominated my mind. . . . power to shape the future would be den me. . . . I was discontented at the prospe and turned over at once to sleep again." Wh he awoke the first results had begun to come and they were, as he now expected, unfavourab By noon it was clear that the Socialists would ha a majority. His wife said to him, "It may be a blessing in disguise," to which he repli "At the moment it seems quite effectively guised."

he Causes of the Conservative Defeat, 1945.—oking back over twenty years later it must n puzzling that the country could have been ungrateful to the man who had pulled the ion through tragedy to triumph. But the ple were not ungrateful. Their verdict was stered, rightly or wrongly, against the Party ch had excluded Churchill from office during pre-war years. The verdict was directed inst the Conservatives despite the admiration Churchill. It was they, not he, who were con- ned for the Munich Agreement and for the -war unemployment. There was also an ercurrent of concern that events might follow pattern of the First World War when the war ler, Lloyd George, was re-elected on generous mises which were not fulfilled.

abour Faces a Financial Crisis.—On coming to e in 1945 the Labour Government was faced the end of the financial assistance given to ain during the war by the United States under system known as Lend-Lease (L69). The ernment accepted a dollar loan but the money out by 1947. Stafford Cripps was appointed ister of Economic Affairs to deal with the s and, in the autumn, when Dr. Hugh Dalton gned as Chancellor of the Exchequer after an screet Budget disclosure to a journalist, he bined both posts. Cripps had been a brilliant yer before entering politics. He was now ter of the economic affairs of the nation. He oduced a programme of austerity in order to ice the demand for foreign currency; and the e unions co-operated by accepting a policy of age restraint." This co-operation was will- y accorded because Cripps controlled prices, ntained an equitable taxation system and use of the social services which the Govern- t had introduced.

he Marshall Plan.—Assistance to Britain e in a new way. In 1947 George Marshall, Secretary of State, proposed a scheme where- is country would assist in a programme for ing Europe on a sounder economic basis. programme would need to be a joint one, ed to by a number, if not all European nations; the initiative must come from Europe, the ed States giving friendly aid and support. est Bevin, Foreign Secretary, jumped at the and with fifteen other nations drew up what me known as the European Recovery Pro- me. The Organisation for European Eco- ic Co-operation which, of course, is still in g, came into existence to administer the pro- me.

vin and America.—Bevin worked increasingly effective collaboration with America and he a prime mover in creating the North Atlantic ty Organisation (1949). This was the first y in which the U.S.A. had ever undertaken opean commitments in peace time. It grew of fear of Russian power. Bevin's policy was cised by some members in his own party. cisms varied. One was that Bevin had doned a specifically socialist foreign policy that he should have attempted to retain inde- ence between the two worlds—the capitalist communist worlds—and tried to build a ge between them. This view was crystallised e advocacy of a "third force" of powers ding between America and Russia and led by in. The group expressing this view were n as the "Keep Left" group, and it was t this group that Bevin made the often quoted rk that he had been "stabbed in the back." members of this group of "Labour Inde- ents" were defeated in the 1950 election.

e Work of the Labour Government, 1945–50.— first measure was the nationalisation of the of England which Churchill said did not any question of principle and there was little sition. The National Coal Board, established ublic but semi-independent body, took over a inefficient industry. The British Transport mission was created in 1947 and took over railways, canals, and road haulage. Cable and wireless companies were nationalised and public corporations created to run airlines; in these measures the new Government were following the lines of policy accepted by earlier governments. The creation of the British Electricity Authority (1948) and the Gas Council (1949) enabled management to be taken of industries which were already under some public control. Beyond all this the Government built a "welfare state" in which the social services were no longer regarded as a form of poor relief but as a co-operative system of mutual aid and self-help provided by the whole nation and designed to ward off distress and strain wherever they may fall. At the centre of the system were the social insurance scheme and the national health service.

The Controversy over Iron and Steel.—The question of the nationalisation of this industry proved controversial and difficult. It was left to the last by the Government. The industry, which was profitable and fairly efficient, was also very complex, ownership penetrating into industries other than engineering. The nationalisation of iron and steel took effect in February 1951 (by the administration formed after the general election of 1950 when the overall Commons majority of the Labour Party was reduced to only six); but the Conservatives, returned to power in 1951, denationalised the industry.

The National Health Service.—This welfare service was created by the Labour Government's National Health Service Act of 1946 and became operative in 1948. It provided all those who take advantage of it with free medical and hospital treatment. The cost is met partly by contributions from general taxation and partly by compulsory contributions from all citizens (except certain exempted persons) and these contributions are payable whether or not advantage is taken of the service. In 1949 90 per cent of the cost was borne by taxes but by 1961 this had dropped to only 70 per cent. Aneurin Bevan who as Minister of Health had piloted this great scheme through all its stages, resigned when the Labour Government imposed charges on spectacles and teeth in 1951 although this was intended only as a temporary measure. Since then, however, governments have continued to increase general charges—on prescriptions, on contributions, on spectacles, dentures, welfare foods, and amenity beds.

The Continuing Needs of a Welfare Society.—Writing nearly two decades later we can see that social services can never be finished articles. A school of writers led by Professor Richard Titmuss have recently shown that some groups have benefited far less than others from the recent increase in production and that behind the façade of affluence there are "submerged groups." Serious social problems remain like the adequate care of the aged, housing and unemployment caused by economic and technical changes. The subject of the care of the aged becomes more urgent every year since the number of people above working age in the United Kingdom is steadily increasing.

Labour and Asia.—The granting of independence by the Attlee Government to India, Pakistan, Ceylon and Burma was of the greatest importance. Seen at the time as a historic achievement, the passage of time has confirmed its momentous nature. It is difficult to contemplate into what tragic paths we might have fallen had independence for India been further delayed. Independence to countries is very rarely given too soon. How easy it is to see now that Britain would have benefited enormously—and the wider world too—had a settlement between her and Ireland not been tragically delayed. The clock of progress was put back fatally. We were spared further conflict with our Asian dependencies by the decisive action of Attlee in sending Lord Mountbatten to India as the last Viceroy in order to transfer power to the Indians. Of the four new states in Asia only Burma elected to sever its links with the Commonwealth.

The Changing Commonwealth.—At this point we may glance ahead at the further evolution of the Commonwealth which followed the grant of independence to the Asian countries—a step criticised vehemently at the time but now seen to have been wise. As other countries in the Commonwealth reached sovereign status most of them sought full membership, so that there were welcomed to membership Ghana and Malaya in 1957, the Federation of Nigeria in 1960, Cyprus, Sierra Leone and Tanganyika in 1961, Jamaica, Trinidad and Tobago, and Uganda in 1962. Kenya and Zanzibar in 1963, Malta, Malawi, and Zambia in 1964, Gambia and Singapore in 1965, Botswana, Guyana, Barbados and Lesotho in 1966. Thus we have a system which bears no resemblance to the empires of the past, a partnership based upon friendship between nations with a diversity of race, religion, and language. This evolution we are now beginning to take for granted; but it must not be forgotten for it is one of the most heartening features of our time. *See also* **Part II.**

Labour Faces the Country, 1950.—During the whole of its term of office, 1945–50, the Labour Government had not lost a single by-election. But the general election of 1950 gave the Labour Party only a very slight majority. They secured only 315 seats, against 298 Conservatives, 9 Liberals, and 2 Irish Nationalists. A considerable defection of middle-class voters resulted in suburban seats in London and the Home Counties returning to Conservative allegiance. Dissatisfaction with continued shortages and with rationing no doubt played a part. The redistribution of seats due to population movement had resulted, in 1950, in an electoral system with a slight bias against the Labour Party since support in working-class areas was so strong as to bank up enormous Labour majorities there, whereas the Conservative vote was more diffused and thus more effective in electoral figures. The result ended Labour's effective control of Commons. Government was scarcely possible with a majority of six and the parties renewed their fight at another election which Attlee called in October 1951.

The Conservatives Regain Power, 1951.—The Labour Party secured the highest total poll that it or any other party had received in a general election—fourteen million votes. The Conservatives received a quarter of a million less; but they secured a majority of seats. This anomaly was due to the character of the electoral system described above. The composition of the new House was 321 Conservatives, 295 Labour, 6 Liberals and 3 Irish Independents. In the atmosphere of relaxed responsibility the controversy which had begun within the Labour Party while they were in power was renewed.

Churchill at Eighty.—No Prime Minister had been so honoured as when members of both Houses assembled in 1954 in Westminster Hall to present to him a book signed by them and a portrait of him by Graham Sutherland. A memorable description of the scene is reprinted from *The Guardian* in " The Glory of Parliament " by Harry Boardman—the throng of several thousand, the drums of the Guards' band beating the opening bar of the Fifth Symphony, which Churchill had so memorably converted into a victory sign ten years earlier. He disclaimed having inspired the nation in the war. He had had only to appeal, he said, to the remorseless, unconquerable will of the people. " It was the British race that had the lion's heart. I had the luck to give the roar."

Eden Succeeds Churchill.—The new Prime Minister, Anthony Eden, who succeeded Churchill in April 1955 decided upon a general election, thus taking advantage of two factors, the controversy within the Labour Party and the economic recovery at that time. There were als at the time, a number of strikes or threats o strikes which affected a wide public and thes disputes were unfortunately due in part to inter union rivalries. The Conservatives increase their majority from 17 in 1951 to 58.

The Election of 1955.—The Conservatives ha a total of 345 M.P.s, Labour 277, Liberal 6 an Sinn Fein 2. Both the Conservative and Labou votes fell—the first by some 400,000 and th latter by over 1·5 million. When Parliamen assembled four older members, including Dalton resigned because of their age from the Labou Shadow Cabinet: and when at the end of th year Attlee resigned the leadership, Hug Gaitskell was elected leader of the party by substantial majority. The Labour Party wa more solidified as a result of the Government' Suez adventure and Bevan was brought back a " Shadow Foreign Secretary."

Attlee's Achievement.—Attlee, who thus re tired from the leadership of the Labour Party went to the House of Lords as Earl Attlee. I Churchill stood for the " finest hour " in ou history, Attlee stood for the social revolutio which followed it. He was the most modest ma ever to engage in politics. As a young man h had gone to the East End of London to take u social work and had become Mayor of Stepney Nobody then could possibly have imagined tha he would one day become Prime Minister an Churchill's Deputy Prime Minister for five year of war. " The difference between the two, wrote Harry Boardman (who described the Parlia mentary scene so brilliantly for many years fo *The Guardian*), " is between genius and extra ordinary ordinariness." " True there is no colour no magnetism, but there is great concentration o purpose, a mind with a razor edge and somethin of harsh resolution." This simple man of fe words transformed the social and economic fabri of the country and changed the face of the Com monwealth into the beneficent world-wide system it has become.

Conservatives' Third Consecutive Victory 1959.—During the 'fifties the Labour Party ha to endure the loss of three consecutive election and a loss of increasing margins. In 1959 afte eight years in office the Conservative Part secured the return of 365 Conservative members with 258 Labour and 6 Liberal members and on Independent. It was at this election that th Liberals doubled their share of the vote partly b running more candidates and partly by the in crease of votes in many of the contests in whic they took a part.

Hugh Gaitskell.—In the three years precedin the death of Hugh Gaitskell Labour had lost it best orator in Aneurin Bevan and its best organise in Morgan Phillips. It was to lose Hugh Gaitskel when, after ten years, it seemed he had wo public confidence as the head of a possible alter native government. Educated at Wincheste College and New College, Oxford he achieved th highest academic distinction as an economist. I was under the inspiration of Professor G. D. H Cole at Oxford that he chose to work for the under dog; and on graduation when he became a univer sity lecturer in economics he gave all his spare tim in the service of the Workers' Educational Associa tion, teaching economics to Nottingham miners During the war, serving in the Civil Service, h came under the notice of Hugh Dalton. At th end of the war he chose politics as a career an won the confidence of Stafford Cripps. Upo Cripps' death, Gaitskell succeeded him as Chancel lor of the Exchequer, making the spectacular ris from member to Chancellor in six years. Thi rapid rise was due to his intellectual powers, hi gift of exposition, his industry and his characte the whole of these qualities being informed by hi humanity and hatred of injustice. Disappointe by Labour's third defeat in 1959 he initiated dis cussion as to how the Labour Party could b modernised. In the words of a colleague, he wa

e to show that the Party's " socialist idealism,
ch is essential to it, is not static, not something
t on tablets but a constantly developing atti-
e of heart and mind capable of embracing and
ng a new meaning to twentieth century
ety." At Brighton in 1962 he clearly had a
ted Conference behind him when he delivered a
rching speech on the Common Market, setting
the criteria which needed to be satisfied before
ry could be regarded as a benefit to country
Commonwealth. When struck by illness at
end of that year, Gaitskell had been acclaimed
a potential prime minister; but the greatest
ortunities were lost to him. He was succeeded
leader of the Party by Harold Wilson who
ame Prime Minister in 1964 and for the second
e in 1966.

he Macmillan Years.—Harold Macmillan suc-
led Eden in January 1957 at the age of 62, in
aftermath of Suez, and he devoted himself to
stablishing the friendly relations with the
ted States which had been strained by the Suez
ir. Early in 1959 he went to Russia for pre-
nary soundings for a Summit Conference,
ch, through no fault of his, was to collapse
nediately it opened in Paris in May of the
owing year. In February 1960 he had shown
t courage in a speech before both Houses of
Union Parliament in South Africa when he
rred to " the wind of change " in the relations
ween Black and White in the continent of
ica. It was in July 1961 that Macmillan
ounced that Britain would apply for full membership of the Common Market, negotiations
tinuing till their breakdown in January 1963.
ong other important events of his premiership
e: the explosion of the first British hydrogen
nb; the settlement of the Cyprus dispute; the
ning of the General Election of October 1959
n an increased majority of 100 seats; the can-
ation of the *Blue Streak* missile programme,
the agreement for U.S. *Polaris* submarines to
Holy Loch; the failure in 1958 to secure free
le with the Common Market and the conse-
nt setting up in 1960 of a European Free Trade
a with countries outside the Market; the set-
up of the National Economic Development
ncil; the legalisation of betting shops; the
ding up of the Central African Federation;
nuclear test ban treaty; and the establish-
t of a Federation of Malaysia.

he Resignation of Macmillan.—From the
dle of 1962 the Government seemed dogged by
fortune which, it was doubtless hoped, would
changed by Britain's entry into the Common
ket. Quickly following Britain's exclusion
e the hardships of a severe winter and of a
den increase in unemployment. When the
ng came the Government were caught in
ther misfortune, the Profumo affair, involving
resignation of its War Minister. This did
ning to still the feeling in the Conservative
ty that the Prime Minister should make way
a younger man, although there was a natural
ctance to press the Profumo affair as a suitable
sion for his departure. Mr. Macmillan indi-
d that he hoped to lead the Party at the next
tion. This discordant position was suddenly
by Mr. Macmillan's illness, which compelled
to resign. By a coincidence his announce-
t came (10 October 1963) the day after the
ual Party Conference had opened. The resig-
on would in any event have caused a great
te in the Party; but dropped suddenly into
excited atmosphere of a conference it caused a
ult. Many analyses have been made of the
ory of those days.

rd Home Becomes Prime Minister.—Mr.
millan's sick-bed became the centre of the
ex in the following week. The Cabinet ap-
ed a memorandum by him as to how sound-
should be taken in the Cabinet, the two
ses, and the Party Organisations. Soundings
taken and two days later they were said to
a continuing deadlock between Hailsham and
er but a small lead for a third; and this third
was not Maudling but Lord Home, then Foreign Secretary, who had been widely regarded as a non-starter. Mr. Macmillan recommended Home to the Queen. How confused the situation was is illustrated by the fact that on the very morning when the Queen sent for Lord Home the first headline in *The Times* was "The Queen may send for Mr. Butler today."

There was an acute debate within the Party as to the way in which the leadership had been decided; and this debate resulted in a method (described below) of electing the leader of the party.

Election Year 1964.—Parliament's legal term expired in the autumn of 1964 but there remained the question whether Sir Alec Douglas-Home would go to the country in the spring or in the autumn. Concealing his hand till the last moment Sir Alec decided to wait till the autumn. For many months, therefore, the country discussed the issues involved and thus went through much of the emotions of an election, which, when it came, seemed belated, the people being a little weary of worked up turmoil by politicians, press, and pollsters. Some of the fire of an election had thus been drawn prematurely from it, but no General Election can lack drama. The Government's majority dissolved and Mr. Wilson kept the lead to a photo-finish. The resultant position is examined in **Part II** with an outline of some of the far-reaching consequences. Before, however, leaving this point in our story we must note the coincidence by which, within the very two days on which the results came in, there occurred two events of world-wide importance—the fall of Khrushchev and the explosion by China of an atomic bomb. If the latter was expected, the former was certainly not. These events, which are discussed later, were more than could be assimilated and their significance will take a long time to digest.

Problems Facing the New Government at Home.—Let us take a glance at the sea of troubles which immediately advanced upon the Wilson administration. The general nature of these troubles had, of course, been foreseen; but they were none the less formidable for that and their exact nature when revealed (like the Treasury's forecast of the payments deficiency) showed they were even more severe than supposed. Production needed to be raised and steadily expanded. For this a number of fundamental steps were necessary. To expand without inflation, an incomes policy (coupling incomes and wages with production) needed to be introduced; and this called for fresh attitudes by both sides of industry. Industry needed to be reinvigorated by science and technology and fresh educational foundations required to be laid. Planning, detailed in character and comprehensive in scope, required both regional, as well as national, planning. " They've given me a bed of nails," said the new Minister of Labour. The metaphor could have been aptly used by the whole of the new team.

Problems Abroad.—The problem of our security posed the question of what kind of co-operation with our allies was desirable and what, then, was possible, an enigmatic France being antagonistic to a Western alliance. How could the long deadlock on disarmament be broken? What rescue could be raced to an overstrained and threatened United Nations? The most ominous troubles seethed in Africa, in the Congo, in Rhodesia, in South Africa. In Asia, the sub-continent of India was developing all too slowly. China, estranged (through no fault of Britain) remained unpredictable as estranged people are apt to be. There was an ugly confrontation between Malaysia and Indonesia. And beyond all these questions and many more remained perhaps the gravest of the lot—half the world underfed, ill-housed, underdeveloped, with insufficient hope. One of the mysteries which will baffle future historians is why so little popular concern was expended on a plight fraught with so much danger for all of us.

The Passing of Winston Churchill.—When Churchill died, not long after his ninetieth birthday, on 24 January 1965 his countrymen and the whole world paid their tributes to the greatest Englishman of his time and recalled the facts of a truly astonishing career. In his *Study of History*, Arnold Toynbee traces a common pattern in the lives of certain great creative figures like Moses, Saint Benedict, Peter the Great, and Lenin. They had all left the scenes of their youth, spent an interval in solitude or in entirely strange surroundings, and then returned to rise to some occasion of social crisis, to meet the challenge confronting the society to which they belonged. Churchill falls into that pattern, being for so many years, in the prime of his life, ostracised by his own Party and politically frustrated; and never more so than during the appeasement years prior to the Second World War which he so clearly foresaw and during which he returned from neglect to dominate the field at home and abroad. He is thus the most recent example in history of Toynbee's " Withdrawal-and-Return " theory.

Election Results 1900 to 1966.

Election of Conservative Party Leader.—A new procedure for choosing the leader of the Conservative Party was announced in February 1965 and it was first used in July of that year when Sir Alec Douglas-Home resigned. The following are the chief features of the new procedure. Ballots will be held among members of the House of Commons who receive the Conservative and National Liberal Whips; and the successful candidate will be presented to a meeting of the party for election a
leader. This meeting of the party consists of:

(*a*) members of both Houses who take th
Conservative Whip;
(*b*) approved prospective candidates; and
(*c*) the executive of the National Union o
Conservative and Unionist Associations.

This body totalled in 1965 about one thousan
That the Conservatives in the Commons shoul
have first say in the choice of leader is based on th
fact that the leader depends on their suppor
In theory the meeting of the party might rejec
the M.P.s' choice; and in that event the M.P.
would have to ballot again.

**The Effect of the New Procedure on the System o
Government.**—Mr. Edward Heath was electe
leader of the party in July 1965. The new metho
of selecting Conservative leaders was a grea
change in our system of government. It marke
the end of a secret ritual whereby a leader wa
lifted up above his colleagues by a Royal summon
in which they themselves played no open part
There is thus a crucial constitutional change—
power being conferred by the Parliamentary part
instead of by Royal prerogative. The chang
from Mr. Macmillan and Sir Alec Douglas-Hom
to Mr. Heath marked a change from the amateu
to the professional. It would be wrong to regar
Mr. Macmillan as other than a professional; but h
generated the Victorian view that it was best t
have a well-educated gentleman at the head o
affairs; and this view was realised in the imag
and promotion of Sir Alec. This pattern wa
broken in 1965. The Party seemed to be facin
the view that to regain power they must narro
the social and financial gap between those wh
lead the Party and those who support it in th
country. The traditional method of choice b
" the customary processes " which had lasted fo
so many decades has been finally abandoned.

The General Election, 1966.—Against all th
odds and expectations, Labour had governed fo
seventeen months with a majority over Conservatives and Liberals fluctuating between five an
only one. Not only that, but when Parliamen
was dissolved it was entirely at the Prime Minister
own choosing. Such is the unexpected course
political events. It might reasonably have bee
held, and was indeed maintained by very many
that no government, short of a coalition coul
exist with a majority of less, say, than a doze
But Mr. Wilson governed with the air of on
commanding a secure majority, for he neith
trimmed his controversial programme nor mad
the slightest gesture towards a coalition wit
Liberals. And he maintained this course again
the particularly severe economic circumstanc
we have described; and against adverse chang
in his Party's popularity. In January 1965 M
Gordon-Walker had lost the famous Leyton by
election; and in the summer of that year th
Conservatives gained ground in local governmen
elections and in two by-elections. The Conse
vatives, during that summer, rapidly overtoo
Labour at the opinion polls. By the autum
however, Labour forged ahead again in esteem—
and this despite the increasingly cruel nature
the problems before them—like the credit squee
at home and Rhodesia's U.D.I. abroad. At th

ening of 1966 there was a real possibility that bour would lose a by-election at Hull and be ced into a general election. A swing of only a le over 1 per cent was needed to return to the nservatives the seat which Labour had gained, recently as 1964, with a majority of 1,181. The vspapers, right up to the eve of the poll, re- rted that Labour was likely to lose the seat. In event, Labour increased its majority to 5,351 a swing of 4·5 per cent—the largest swing to governing party in any by-election in a rginal seat since May 1924. The death, within ew days, of another Labour M.P. emphasised continuing precariousness of the Government's jority. Amid general expectation, Mr. Wilson ose to appeal to the country on 31 March 1966 l Labour's recovery was complete (*see* C 8). e return to full power was all the more remark- e when one recalls two facts: first, that between 9 and 1961 it seemed as if the Labour Party ght disintegrate or slip into a long decline; and ond, the fact that Labour had received so tiny ajority in 1964 when all the situation was in its our.

he Nuffield Study of the 1966 Election.—The nplete story and analysis of the election will be nd in the volume *The British General Election 966* by D. E. Butler and Anthony King (Mac- lan). Since 1945 the Nuffield College Studies British general elections have become an ablished feature of the political scene. In the 6 volume a full examination is made of how Labour Party managed to escape from the ards of its hairsbreadth majority and to win itself its clear-cut electoral victory. It cribes the strategic thinking and preparations each of the parties. The campaign itself is cribed in detail with special attention to press, vision, and opinion polls and the volume lyses the results very thoroughly. The 1966 ume is a fascinating study of the struggle for ver.

he July '66 Crisis: some political implications.— explained in the Economics section the Govern- nt, to save a further run on the £, declared in y 1966 drastic measures to deflate the economy; mployment rose; and confidence in future ansion declined, causing business to cut back estment plans. Were there inherent reasons the crisis or was it caused by external causes? crisis seemed a recurrence of similar previous es—the last being that before October 1964 n the Conservatives were in power. As this is was one of a series it did not seem con- cing that it was due to Socialist measures and cies, as some Tories said; nor, on the other d, was the Labour claim convincing that the ernment had been " blown off course " by an ucky chain of events outside their control like seamen's strike or the rise in copper prices. had not seemed able to steer a sensitive middle rse between a runaway expansion and a crude wasteful recession. The Government in 1966 lated a number of steps to be better able to t a smoother course. These were to secure er information on which to base decisions; to ngthen planning machinery to carry them out; stimulate modernisation; and to promote bility and retraining of labour. But three or political questions remained to be solved to deficits into gold. Can we afford to con- e to be the world's banker; and a world plier of capital; and a world military power?

2. SOME CURRENT DOMESTIC TOPICS

University of the Air (The Open University).— the first time, it has become possible to think erms of a University of the Air. Television radio, programmed learning and a wide range udio-visual aids have already brought con- rable changes. Our best teachers can now be e available to vastly wider audiences. Mr. old Wilson outlined the Labour Party's pro- l for a University of the Air at Glasgow in ember 1963; and on attaining office Miss ie Lee was appointed as Minister responsible arrying the project into effect. Mr. Wilson reaffirmed his intention that the new University should be a serious, degree-giving, academically irreproachable enterprise; and that its purpose would be to contribute to the improvement of educational, cultural, and professional standards by making scholarship of a high order available to all who care to take advantage of it. In the homely language of Miss Jennie Lee the project is not going to be a " Paddy-the-next-best-thing, a dawn patrol or a midnight parade or a patch on the working man's trousers "! It is not going to be a hobby or a pastime but a social dynamic. It will have a correspondence course second to none in the English language and a *corps d'élite* of lecturers drawn from the most distinguished academic circles. It will set challenging high standards.

White Paper on the University of the Air.—Miss Jennie Lee appointed an Advisory Committee to consider Mr. Wilson's proposals and their views were published in the Government's White Paper (Cmnd 2922) in February 1966. Discussion had centred on the type of courses that should be offered; the nature of the supporting services; and the framework of the organisation required. The broad agreement which was reached included the following recommendations among others:

> (1) That the University will require its own administrative centre but should make full use of existing agencies, such as the Extra Mural Departments of Universities, the W.E.A., etc. The centre will need to have its own studios.
>
> (2) The University should offer primarily courses leading to degrees, but professional, technical, refresher, and conversion courses should be included.
>
> (3) The degree course should be of a general type. It should cover a group of subjects that could be taken at two levels, " minor " (ordinary) and " major " (special). The course will generally take four years but it could be spread over a longer period.
>
> Intermediate qualifications should also be awarded as a stage of a course is completed successfully. A "credit " system should also operate so that different parts of a course could be taken separately and still add up to a recognised qualification.
>
> (4) The degree courses would include subjects of contemporary social, industrial, and commercial importance; basic subjects like English, mathematics, and foundations of science; and a range of cultural subjects.
>
> (5) The presentation of courses will variously involve a combination of television, radio (if local stations are established these would be particularly helpful), correspondence courses, programmed instruction, tutorials and practicals, short residential courses, and study and discussions at a community viewing or study centre.
>
> (6) Enrolment should be open to everyone and there should be an advisory or information service for intending students.

The Demand for Education.—The need for higher and further education is tremendous and this demand cannot be resolved by expanding places in universities and colleges. Even with that expansion many of those with university or college entrance qualifications have found difficulty in obtaining a place. Approximately 11,000 school leavers were turned away from universities in 1964, although their qualifications would have obtained places for them in 1954. This crisis of the 'sixties was entirely predictable. Many of the children born during the post-war birthrate bulge would obviously be needing six-form places in the early 1960s. And the proportion of young people staying on till the sixth form was also increasing steadily throughout the 1950s. Nevertheless 70 per cent of children leave school before they are 16 and the percentage of children of unskilled workers is much higher. Despite the present programme of expansion for higher education only 14·6 per cent of school leavers will go on to full-time higher education, including further education, by the early 1970s. A great demand, explicit and potential, for education exists. Because a system rejected many at eleven or eighteen it does not follow that they are unable to reach much higher levels of learning and professional or technical achievement. This, then, is the hour for the Open University; by the imaginative use of television, radio, new teaching techniques, and personal supervision, an exciting advance can be made in adult education and the enrichment of people's lives. Over half of all graduates in Russia have obtained their qualifications by means of correspondence courses. In the U.S. the use of television as an essential educational medium has been recognised for many years.

The Spread of Education.—A dip into the Statistics of Education published by the Department of Education and Science yields some interesting facts. It is forecast that the population in schools could be 8 million by 1970 and 11 million by 1980. This compares with 7·8 million in January 1965. These increases are due to bigger age groups, to the growing tendency to remain voluntarily beyond the minimum leaving age, and to the raising of the school leaving age in 1971. The number of students training to become teachers in England and Wales rose by more than 50 per cent in the three years to 1965; recruitment is much greater among women than men. The greater demand for education among those who have already left school is reflected by the fact that a million more people are attending further education classes than 10 years ago—2·9 million from 1·9 million, although this rise is in part due to increase in population.

Primary Schools: the Plowden Plans.—The fourth report in the stream of Reports on the future of education was published in 1967. It was the Plowden Report on primary education, the fourth in the series consisting of the Crowther, Robbins, and Newsom Reports. It recommended for top priority a crash programme of aid for primary schools in depressed areas, the recruitment of teachers' aides, and the improvement of bad buildings. It also proposed the extension of nursery education, closer relations between schools and parents, the abolition of corporal punishment, and a new organisational structure for primary education. This structural change would involve a single date of entry (the September term following a child's fifth birthday) a three-year course in the first (at present the infant) school from five-plus to eight-plus, and a four-year course in the middle (at present the junior) school from eight-plus to twelve-plus. The report pointed to the belief that for most children the junior school course now ends at too early an age, to the increasing school populations in the 15–18 group and to the trend towards bigger secondary schools, making it difficult to cater for children as young as 11. The arguments in favour of 12 and 13 as the age of transfer were said to be "fairly evenly balanced" but 12 was selected rather than 13, as the best age, educationally, for the children. Because Mr. Crosland, the Minister, had to get comprehensive education moving fast he had already approved a large assortment of comprehensive schemes with several transfer ages.

The Threat to the Countryside.—A decade or so ago we may have felt that, by vigilance and action, what remained of the beauty of the countryside could be saved. After a hundred years of advocacy the preservation movement had seen the setting up of local planning and the creation of national parks and nature reserves. The duty of holding back the forces spoiling the countryside had at last been vested in statutory bodies and not left entirely to the endeavours of voluntary bodies. National Parks were created by official action. The optimist was tempted to feel that the danger had been diagnosed, however late in the day; and that the officially appointed watchdogs could confidently be left to stop further depredations. But events soon broke down any such assumption. Power and atomic energy stations, open cast mining, aerial masts for a variety of purposes, overhead electricity cables and pylons to carry them, coastal refineries, hydro-electric schemes, roads houses all made their demands. He would be an exceptionally insensitive and complacent observe who could be satisfied that a fair balance had been struck between the material needs of the com munity and their aesthetic needs, both of which ar vital.

The National Parks Commission.—A list of the National Parks and the Areas of Outstanding Natural Beauty which have been designated s far in England and Wales will be found on L81 and of the Long Distance Walking Routes and Bridlepaths which have been approved on L72 As we have explained, it took close on a hundred years for concern for the countryside to become a statutory obligation of a government body; and when at long last we had in 1949 a National Park Act it was soon seen to need strengthening Minister after Minister promised to give the National Parks Commission power to tackle the problem effectually. Minister after Minister made the excuse that he could find no time to fulfil his promise. Finally the long suffering and patien Commission protested. There were thus grea expectations upon the advent of a Labour Government. By that time the subject had become more complex partly because of the need fo areas for intensive recreation. The new Ministe affirmed the basic principles of the Commission' views on strengthening their powers and promised to make his proposals known.

Leisure in the Countryside: England and Wales —The promised White Paper appeared in February 1966 (Cmnd 2928). Whatever change may come in leisure habits, and however much ou towns may be made more fit for living, a very large number of people will probably continu to spend a large part of their free time in thei motor cars, visiting the countryside and the coast And the number of cars, already 9 million, i expected to reach 26 million by 1980. The Government proposed the creation of "Country Parks" which would serve three purposes: (1 they would make it easier for town dwellers to enjoy their leisure in the open, without travelling too far and adding to congestion on the roads (2) they would ease the pressure on the more remore and solitary places; and (3) they would reduce the risk of damage to the countryside The main instrument for the creation of Country Parks would, it was proposed, be the County Councils which would be given powers of acquisition. There will also be picnic places in the countryside and on the coast. A survey would be made of reservoirs to overhaul rules governing public access to reservoirs and gathering grounds The possibility of access to open country is to be widened in two ways: (1) expenditure for access agreement or orders will be eligible for gran throughout the countryside and not, as at presen in the National Parks and Areas of Outstanding Natural Beauty only; and (2) it would be possibl to make access agreement over any land necessary to give access to open country and such agreements would not be limited, as hitherto, to land defined as such under the National Parks Act 1949. A regards the survey of footpaths and bridleways required of County Councils under the 1949 Ac the White Paper reported that only half the councils had published definitive maps; and proposed that County Councils and National Par planning authorities should be given powers t act as footpath creation authorities.

The Countryside Commission.—The Governmen in the White Paper outlined above, proposed the reconstitution of the National Parks Commission to be renamed the Countryside Commission. The grants of 75 per cent payable in respect of Nationa Parks and Areas of Outstanding Natural Beauty would be extended to the further projects and steps outlined in the White Paper.

Comments on the Government Proposals.—While the proposal for country parks is to b welcomed, a clear distinction is called for betwee the two kinds of parks—national parks an

ntry parks. In the country parks there may
provision for simple forms of recreation, but if
park is truly in the country there should be no
vision for those organised sports which attract
wds of spectators and necessitate stadia, very
ge car parks and intrusive buildings. Such
times should be catered for in or near towns.
regards access to open country little has been
ne to provide access agreements, apart from the
k District National Park. Indeed restrictions
access are arising where, in the past, there has
n traditional freedom. Vigorous use needs to
made of existing powers without waiting for
legislation. One of the biggest disappoint-
nts of the 1949 Act has been the paucity of new
hs created and the details of Government pro-
als were awaited for a simplified procedure for
creation of new paths. The scope of the pro-
als for grants for National Parks remained far
rt of what the National Parks Commission had
long recommended, namely that the grant of
per cent should be payable towards the totality
dditional administrative expenses involved in
ional Parks and not only in respect of such
t of the additional administrative expenses as
nvolved in the creation of new facilities or the
provement of the landscape. As regards the
of grants, experience suggests that full
ctiveness is, in most cases, unlikely to be
ised unless a 100 per cent grant is available.
ove these particular considerations there re-
ned serious doubts of a general kind. It
ned doubtful whether National Parks still
ined their rightful place in the Government's
king; whether the provisions suggested for
countryside generally are adequate; and
haps most of all) as to the adequacy of the
vers suggested for the Countryside Commission.
these factors, expressed for a large part by the
ional Parks Commission itself, as well as by
fficial bodies like the Ramblers Association,
t indefatigable watchdog, caused grave concern
the vigilance over our disappearing country-
will not be nearly so strong as it should be.
se who wish to keep themselves acquainted
n the discussions should join the Ramblers
ociation, 124 Finchley Road, London, N.W.3.
urther disappointment was the announcement
ompanying the White Paper of February 1966
no Parliamentary action was possible in the
rent session. It is not necessarily suggested
that this delay was avoidable. But coming
r the string of broken promises by Ministers in
vious Governments under circumstances
cribed above the further delay seemed particu-
hard to bear. Time is running out for the
servation of the countryside.

he Natural Environment Research Council
over the responsibilities of the Nature Con-
ancy in June 1965. The new Council sup-
s and undertakes research in the earth sciences
in ecology and, in addition, the Nature Con-
ancy took over the Geological Survey and
eum, the Hydrology Research Unit and the
ional Institute of Oceanography. It under-
s fisheries research, research hitherto carried
by the Meteorological Office, and long term
stry research in consultation with the Forestry
mission. The new Council thus brings to-
er the natural life and earth scientists.

he Future of Common Lands.—In our over-
ded country nobody can afford to disregard
illion acres which make up no less than 4 per
of the total land area of England and Wales.
oyal Commission on Common Land described
lands in 1965 as the "last reservoir of un-
mitted land" which provide, as far as the pub-
concerned, by far the largest part of the ac-
ble open spaces of the country. While the
ort recommended substantial changes in the
relating to common land, designed to secure
the fullest practicable use of these common
may be made in the interests of the owners,
commoners, and the public, it also recom-
ded that common land should continue to be
lable and safeguarded from permanent in-
re and thus continue to provide places to
h the public might resort for air and exer-
The public, it said, should have a legal right of access to all commons, subject to the same conditions as apply to areas of open country which are under an "access agreement." (An access agreement under the National Parks Act, 1949 gives the public access to land, subject to conditions of behaviour.)

Registration of Commons.—The Royal Commission recommended that there be a Commons Register in which claims that land is common should be registered. They also proposed to remedy the existing state of affairs whereby there was considerable neglect of commons, and the making of individual, new, and more flexible schemes of management for each common. Under the Commons Registration Act, 1965, which resulted it will be the duty of County Councils and County Borough Councils to make a register of all common land and all town and village greens in their areas. The registers opened on 2 January 1967 and there will probably be a period of three years within which applications may be made for land and rights to be registered. What are common rights and who exercises them is a complex subject, and for more detailed information the reader is referred to a publication issued by the Common, Open Spaces and Footpaths Preservation Society, Suite 4, 166–170 Shaftesbury Avenue, London, W.C.2. entitled *Commons Their Nature, Functions and Preservation* (1s.). If a common or green lies in your district or parish and you wish to know how interested persons and bodies can take preliminary action you should apply to the Society for their off-print entitled *Commons Registration Act* which is an authoritative and explanatory set of notes (price 3*d.* and stamped addressed envelope).

The Council of Nature is a voluntary body which represents the naturalists and country lovers of the British Isles. It has some 350 member bodies and thus can represent the views of some 90,000 active naturalists to government departments, ocal authorities, and other bodies. It works for the greater appreciation of the importance of nature conservation. It is concerned with poisonous seed dressings which have killed thousands of birds; with the spoiling of the coastline; and with the enforcement of the Bird Protection Act. Its Intelligence Unit on British natural history answers questions on a wide range. The Council of Nature has Brantwood, formerly the home of John Ruskin, as a residential holiday centre on the shores of Lake Coniston, where there are courses on natural history and on ciné and still photography of wild life. It also organises the Conservation Corps which enables young people to help preserve wild life and the countryside while they enjoy a "hard work" holiday as well. *See also* **U 19.**

The Over-population of Britain.—This country is already over-populated; and whatever we decided to do about it would inevitably be more so in the future. This was the view taken in his presidential address to the British Association by Sir Joseph Hutchinson in 1966. There are 570 of us to the square mile. He suggested a target stable figure of 40 million. But it will take all the knowledge and skill we can command to prevent irreparable damage to our environment before we achieve a stable population. We already carry a population as great as the environment can support without degeneration. "Surely we can learn the fact," he said, "that large families are detrimental to the interests of our children later in their lives." The fall in the birth rate to less than the replacement rate during the slump of the 1930s and the Second World War showed, said the President, that our community was sensitive to constraints upon multiplication such as economic depression and the hazards of war. It might be then, that if we really appreciated the threat to our children's wellbeing posed by unrestricted numbers, we would take advantage of the techniques of control available to us. To help to maintain a correct balance between man and nature a new society—the Conservation Society—was formed in 1966 to unite those working for population control and those fighting for beauty of environment.

Our Own Poor.—In discussing world hunger (below) we have said that what the poor world lacks is the hope of improvement. The poor in the rich countries are not so bereft of the expectation of improvement. But the problem of the poor in our midst is an acute one, all the same. Let us take the position even before the Callaghan squeeze of July 1966. The average wage-earner, according to national statistics, was then in the £1,000-a-year bracket. But there were then between 200,000 and 300,000 families in which the breadwinner earned less money than the minimum scale laid down for National Assistance. There were thus something like 1,250,000 men, women, and children living below the standard tolerable under the State's own system of aid which can scarcely be deemed excessively generous. There were probably another 2 million living only just above this standard. These figures count only those families whose head is working. Add the old, the sick, and the crippled. The problem took on a new dimension as the Callaghan measures cut deeper.

3. WORLD PROBLEMS AND EVENTS.

World Hunger.—It is important to know whether the gap between the rich world and the poor is getting wider or narrower. The evidence is that it is getting wider. The rich world comprises North America, Europe, the Soviet Union, and Australasia; and broadly the poor world is Asia, Africa, and Latin America. (It will be seen that this is rather a different division from that between the so-called free world and the communist world; and it is likely to prove a more important division). Overall wealth (the gross national product) has since 1960 been increasing at 4·7 per cent each year in the rich world and 4·4 per cent in the poor world. But this statement does not contain the vital factor of what the growth was *per head*. The poor world is vaster than the rich—it contains 2,500 millions of people; and this factor is crucial. We are told that in the poor world gross domestic production *per head* is rising by only 1·4 per cent a year. If population continues unchecked the poor world may cease to have any growth *per head* at all by 1975 and steady impoverishment will set in. The evil is not population growth as such but growth in the midst of poverty. The population of the United States is rising, but so is its prosperity. What the poor countries cannot do is to supply sufficient houses, clothes, domestic and medical apparatus to its people, except by buying from abroad, and this cannot be done on anything like a sufficient scale. Sheer starvation remains a threat to many countries, with a drift of unskilled and unemployed to the slums of cities. Further, the ratio of unproductive people in the poor countries is very large: one Indian in every three is under the age of 10; many women are engaged in producing a child a year; and illness—especially blindness—prevents much of a contribution to a country's effort. A crucial difference between the rich and poor countries is that in so many of the latter the conditions for progress do not exist and are unlikely to be created without a social revolution which the assisting countries are unlikely to foster. Chiefs, landowners, and moneylenders do not encourage change. Interest on loans have to be paid. Prices of the primary products exported by poor nations often swing against them. We come back to the fundamental point that the difference between the two worlds is not only a difference in material terms; the lack in the poor world is the expectation of improvement. Few nations in this other world have reached the point where the circle of continuous poverty has been broken—the take-off point, as it is called. The exceptional countries which have done so are Mexico, Japan, and Israel—all with the help of considerable aid. We may reasonably suppose, too, that China has now reached that point, unassisted by aid; by a dramatic effort she has found the necessary investment from her own resources.

The State of Food and Agriculture.—The gravity of the outlook was emphasised by the report published in 1966 by the United Nations Food and Agriculture Organisation. It reveale that food production failed to rise in 1965–66 bu the population increased by about 70 millior The world average was maintained only by goc harvests in North America. Food production pe person in developing regions dropped back to th inadequate level of 1957–58.

Except in the Near East, food production estimated to have fallen by 2 per cent in total an 4 to 5 per cent per head. When many millions ar undernourished, there is little margin against ba seasons. The world food situation is more pr carious than at any time since the period of acut shortage immediately after the war.

World Aid.—The rich world is now helping th poor by just over £1 per year for every mar woman, and child on the other side of the barrie Aid in 1965 was 7,600 million dollars, a poor con parison with what is spent on space trave luxuries, armaments, or advertising. It was nc far short of the 1 per cent of the rich world income which was specified as desirable. But th grants are in jeopardy. Britain had to cut £2 million in overseas development fund. In Franc President de Gaulle's personal determinatio keeps France the most generous giver in propor tion to her wealth. In the U.S. the cost of th Vietnam war is a rival to the campaign agains world poverty. And in Russia her own relativ low standards militate against foreign aid.

The Population Expansion.—The Unite Nations reported in October 1966 in its Demc graphic Year Book that world population wa increasing by 180,000 a day. It exceeded 3,28 million in October 1965 and at the present rat will double within 40 years. Between 1964 an 1965 the increase was 65 million—equalling th combined population of France, Portugal, an Greece. The world's highest life expectancy rat was in Europe regarded as a continent. Britain rate was 67·9 years for males and 73·9 for female Eastern Europe as a group had the world's lowes fertility rate; there was an extremely high fertilit belt in Africa. Marriage rates were on the i crease in the United States, Britain, Ireland, th Netherlands, Norway, Portugal, and Sweden.

Population and the Supply of Food and Natura Resources.

The future relation between population an food and resources is an obviously vital aspect c the world's currently high rate of populatio growth. Broadly speaking, there are two oppose schools of thought, the one contends that wit scientifically directed exploitation the earth resources are large enough to solve the food an population problem, the other that there is a rea and early danger of the demand from increase population outstripping the supply from resource If a much greater degree of political compatibilit and fluidity of trade between nations could b achieved, the world could probably support th existing growth rate of population of 2 per cer per annum for a century or so without making to many speculative assumptions about scientif and technical developments. National bour daries and international rivalries cannot howeve be ignored, and serious analyses indicate that th population of some of the more crowded countrie of Asia, such as India, already face the gri possibility of being condemned to a lasting stat of undernourishment and malnutrition, unle successful and simultaneous action is taken bot to reduce the rate of population increase and t improve agricultural and industrial productivity

Nasser and the New Egypt.—A new factor in th Middle East was introduced when the Egyptia Army revolted in 1952, overthrowing the mor archy, leading two years later to the emergen of Nasser as Prime Minister. In that year Nass secured the agreement whereby all British forc were to leave the Suez Canal Zone by 195 Egypt did not become a democracy in ar Western sense but the government runs all th

ɔ enterprises of the country. In 1956
ser internationalised the Suez Canal Company

s offer to finance the High Dam at Aswan.
attack by the British and French on Egypt
wed, causing serious disagreement with the
ed States, which inspired international action
escue Egypt. (It was while we were bombing
pt that Russia suppressed a revolt in the satel-
of Hungary.) The nationalisation of the Suez
al and the building, with Russian help and
ce, of the High Dam are the two most import-
of Nasser's actions.

ypt and Russia.—A new chapter had opened
955 when the Russians made an arms deal
Egypt. By that action Russia became a
lle Eastern Power. She upset the Anglo-
rican policy of balancing arms deliveries to
l on the one hand and the Arab states on the
r. (It was all the more creditable to the
ed States that she was shocked by and
sed a war upon Egypt when it came next
) Russia's influence in Egypt penetrated a
ern preserve; and she leap-frogged the
rthern tier" of Turkey and Iran (which, with
stan, had been grouped by the United
dom into a defensive barrier known as
TO, the Central Treaty Organisation). Russia
nued to pour in money, equipment, and
icians in the building of the High Dam which
begun in 1960 and should be completed by
.

ael.—This is an appropriate point to re-
ulate the salient points about Israel. Pales-
formerly part of the Turkish empire, had
ruled by Britain from 1918 to 1949 under a
ue of Nations mandate upon the basis of the
sh declaration that Palestine should be "a
nal home" without injury to the Arab
lation. The Nazi persecution of Jews
rally quickened Jewish migration to Palestine
this caused strain between Arabs and Jews.
the massacre of Jews by Germany during
var itself, there was naturally a stronger flow
nigrants of Jews to Palestine; and when
in restricted this flow and tried to curb
l immigration, tension increased between
and Arabs. In 1947 Britain said she
l surrender her mandate and asked the
ed Nations to find a solution, which they did.
heir plan to divide Palestine into Jewish and
states was rejected by the Arabs. When
in withdrew in May 1948 the Jews pro-
ed the new state of Israel, which was at once
nised by the United States and Russia; but
ountry was attacked by neighbouring Arab
. The Israelis successfully defended them-
, although greatly outnumbered, and in
the United Nations secured an armistice.

Arab World.—At the opening of 1967 the
pal elements in the Arab world were the
down of the unstable truce established by
summit conferences in 1965; the struggle for
ry of the Middle East between the progres-
epublicans and the conservative pro-Western
rchies; the defence agreement between
and Syria (an unstable country); the re-
s of both those countries with Iraq (another
tainty); the opposition of Nasser to King
of Saudi Arabia; the keeping of a large
of Egyptian troops on the Yemen border of
Arabia (criticised by Jordan on the ground
t diverts forces from common Arab defence
t Israel). Half the Arabs live in Africa and
her half in Asia: but the idea of Afro-Asian
rity has not been strong enough to assist in
y of the Arab world. Put the other way
, the centrifugal forces in the Arab world
the uncertainties in the "third world" as a

urning Point in Soviet History.—In 1961
hchev publicly and dramatically completed
ocess which he had begun in 1956, of drawing
a line under the Stalin régime and finally rejecting the cult of Stalin. This change was symbolised by the removal of Stalin's body from the mausoleum at the Kremlin. At the same time Khrushchev was confronted by an external challenge to his leadership of the Communist world—by China who believed that Russia was moving steadily away from classical communist doctrine.

Stalin had made the Soviet Union a modern industrial society and a great armed power. But the arbitrary bureaucracy through which this had been achieved had, in Khrushchev's view, overrun itself. Radical changes became essential and Khrushchev attempted various steps—the scaling down of the secret police; the rebuilding of the administrative apparatus; the opening up of virgin lands; and a new theory that war was not inevitable. The legacy of the Stalinist era had been the concept of the "monolithic" party, that is to say, a party which, however torn by internal conflict, must never allow any open division of opinion and free debate, much less the formation of any groups expounding distinctive views. This concept was challenged at the 1961 Congress.

Khrushchev Leaves the Political Scene.—The career of Nikita Khrushchev as Soviet Prime Minister and Leader of the Communist Party came to an end—to the surprise of the world—in October 1964. Stalin had died in 1953 and the struggle for succession then continued for five years, when Khrushchev emerged with supreme authority. Upon Stalin's death a triumvirate of successors, Malenkov, Molotov, and Beria had decided to give the post of party chief—First Secretary—to Khrushchev, then a relatively harmless outsider, or so he was deemed by them. Beria, the all powerful police chief, was executed as a spy in 1953, Malenkov was forced to give up the premiership in 1954 and three years later both he and Molotov were expelled from the Central Committee. Khrushchev thereupon emerged with supreme powers, and became the talkative and jocular leader whom the world knew.

The Pattern of Change in Leadership.—The student of affairs may be puzzled by the strains and dislocations which occur upon a change of leadership in Russia. But this is less surprising when it is remembered that there is no constitutional manner of embodying a change of opinion or policy in an alternative party or group of men. It will be seen from the diagram of events that after Lenin's death control was divided between the Secretary of the Party and the Premier for seventeen years, until Stalin combined both posts. After Stalin's death in 1953 control was again split (except for ten days) for another five years until, in 1953, Khrushchev who had been Secretary for five years combined the two posts again until 1964. The pattern repeated itself in 1964 Kosygin becoming Premier and Brezhnev Secretary. A meeting of the Supreme Soviet in 1965 confirmed the principle of collective leadership. At the 23rd Soviet

Secretary: Brezhnev 1964

Party Congress held in April 1966 it was decided that the Praesidium of the Central Committee should go back to being the Politburo and the First Secretary should revert to General Secretary. The new 11-man Politburo has an inner cabinet of four members: Brezhnev, General Secretary, Kosygin, Prime Minister, Suslov, the Party's theoretician, and Podgorny, the President of the Soviet Union.

A New System of Social Planning.—At the Supreme Soviet in 1965 Mr. Kosygin, the Prime Minister, announced a new system of Soviet planning. There have been only two movements of comparable importance since the Revolution:

(1) the beginning of Lenin's new economic policy in 1921; and
(2) the forced industrialisation through five-year plans in 1928.

Under the five-year plans the "command system" of production involving centralised planning in minute detail has held the field. It was the first object of every factory manager to reach or overreach his target and this might be regardless of profits or quality. Under the new scheme central planning is reduced. Managers are to be given broad targets and then left to produce as best they can to sell the goods and to make a profit. Sales volume and profits become the criteria of plan fulfilment. Thus the needs and desires of consumers acquire a new and effective importance. The new system seems a genuine attempt to reconcile three things:

(1) central planning;
(2) personal enterprise; and
(3) the wishes of consumers.

The State will receive interest on long-term credits for capital equipment as well as a share of the profits. The rest of the profits will be at the disposal of management for ploughing back and for incentive payments in the form of higher wages and special bonuses. This reform in the Soviet Union is clearly a compromise and like all compromises runs a risk of some instability. The student of affairs will therefore watch whether the system will issue into a greater liberalisation or to a re-imposition of the tight planning system. Another aspect of the compromise is the tension between the more flexible and empirical approach by the technocrats running the production ministries under Kosygin and the more dogmatic and traditional outlook in the Communist Party under Brezhnev.

Russia and China.—By the end of 1966 Russia was rallying support for a world Communist Congress to censure China and a turning point was reached in Sino-Soviet relations. Russia through *Pravda* accused China of duplicity in international relations—aggravating the situation, yet standing aside from the struggle against imperialism. Russia complained that her share in China's foreign trade had dropped from 50 per cent in 1959 to 15 per cent in 1965 whereas China's trade with capitalist countries was growing. The Kremlin complained of disunity over Vietnam.

Yugoslavia: The release of Djilas.—As a part of the new wave of liberalisation sweeping Yugoslavia, Milovan Djilas, her most illustrious prisoner of conscience who had been in and out of prison since 1956 was released at the beginning of 1967. Djilas had been one of Tito's closest associates and with him led the fight against Stalin when the break came in 1948 over reluctance to accept dictation from Moscow. Djilas, however, went on from criticism of Stalin to criticism of Stalinism and examined the new bureaucracy of Yugoslavia's own Communists. He continued to publish abroad his judgments, notably in his book *The New Class*. The aim of Djilas is to free communism from monopolism and totalitarianism: and this is what is happening in Yugoslavia today. Thus Djilas on release found that many of his countrymen had accepted the views for which he was punished.

The Changing Face of Asia.—The independen
and unity of India on the one hand and t
emergence in China of the Central People's R
public on the other form the two most importa
political features of Asia. The two countries ha
lived, historically speaking, in different world
their experiences at the hands of the West ha
been different; their recent developments a
their present political systems are entirely dis
milar—the one a democracy and the oth
authoritarian.

Indian Changes under British Rule.—T
pattern of her development after independen
had been set during British rule. The ma
features were: the concept of law and the rule
law; a civil service superior to any known befo
in Asia; a system of education introduced as f
back as 1835; English as a common languag
and the growth of an intelligentsia (to use a wo
with a Russian origin) with a humanistic outlo
and responsive to Western ideals and tradition
Important consequences followed from the
changes. They enabled Hindu society to refor
itself on the basis of modern ideas; to create
educated leadership; to modernise Indian la
guages; and to introduce modern science to Indi

The Leadership of Mahatma Gandhi.—That t
dissolution of British rule was made so peacefull
a miracle of modern times, was due principally
Gandhi who associated nationalism with ethic
concepts, summed up in the term "Gandhism
and denoting pacifism, the value of the individu
soul and humane ideas. He made India consci
of the social reforms which needed to be made a
created the discipline to make a democracy ab
to carry them through. Gandhi's ideal of re
gious unity, though disrupted by the partition in
the two states, Pakistan and India, made it po
sible for the new India to be a secular state,
which all religions and minorities had equal righ

Nehru, India's first prime minister, symbolis
India's highest aspirations. As a disciple
Gandhi he revered him; but his political outlo
had been different. He was an enlightened libe
working towards a modernised, rational, dem
cratic, secular state enjoying both the benefits
large-scale scientific organisation and the spiritu
good of individual liberty. Under great strai
this way and that he maintained neutrality in t
face of world power blocs and embodied in h
politics characteristics from differing régimes.

garded as a good, kind, and tolerant man.
faced problems as complex as any statesman,
the world's biggest, hungriest, and restless dem
cracy. One of his biggest decisions was not
follow China in the nuclear weapons race.

Mrs. Indira Gandhi became Prime Minister
India in January 1966 upon Mr. Shastri's death
the Tashkent conference. Her father was Neh
and she must be regarded as the only daught
in history to have succeeded her father. She
not a relation of Mahatma Gandhi. In Indi
families women have always been very high
regarded and India is one of the very few countr
where nothing stands in the way of a wom
going to the very top. Mahatma Gandhi
far back as 1929 had been uncompromising
women's rights and after Indian independen
Hindu law was changed to satisfy his requireme
on the status of women. Thus it was Gandhi w
took women into politics and paved the way f
the election in 1966 of Mrs. Gandhi, the worl

powerful woman. (Mrs. Bandaranaike of
on holds the distinction of being the first
an Prime Minister in history.) Mrs. Gandhi
ore radical than both her father Nehru and Mr.
tri but clings to no "ism" and will confront
problem individually. Among those round
tri who helped to guide India, she was by far
most cosmopolitan. Educated in Switzer-
and at Oxford, she travelled widely with her
r and as his hostess met many world leaders.
family is Hindu and there is no doubt that
hares her father's devotion to the ideal of a
ar state. She faced, on election, many
ulties; she promised to honour the agreement

ced her willingness to negotiate with China
vourable conditions are created.

dia and Pakistan.—The strained relations
een these two countries have formed a sor-
ul chapter. The concrete problems which
recently arisen between the two countries
ot, in themselves, the cause of the strain but
he result of earlier deterioration of feeling.
deterioration was most severe in the year
e actual partition, when tension between
us and Muslims exploded into communal
are in Calcutta and in certain provinces
ding the Punjab. This strife had roots
h struck deep into history for the Muslims
between the eleventh and sixteenth centuries,
uered by stages almost the whole of India.
Muslims had forestalled the British Westerners
ringing almost the whole of India under a
e government. Therefore in the territories
in the Indian Union, the Hindus are masters
eir own house for the first time since the be-
ng of the Muslim conquest of India so long
The partition of the sub-continent inevi-
left large pockets of minorities of Muslims
dia and of Hindus in Pakistan. The long
ry of conquest, of difference of religion and
re and the bitterness of partition itself—all
background accentuated problems which
l not in themselves have been so difficult to
. We must recall that Gandhi, Nehru and
Indian leaders did their best to heal com-
l strife.

dia and China: The Frontier Dispute, 1962.—
unfortunate clash between these two countries
their border came to a head in the autumn
62. The Indian Government had taken the
that the 2,500-mile northern frontier drawn
hen the British ruled India remained valid,
eas that alignment is not recognised by China.
he issue did not become a live one until 1959
China had occupied Tibet. Repeated
pts to negotiate an agreed frontier failed.
disputed areas are (1) the northern region of
mir called Ladakh; the Ladakhis are
hists with intimate ties with Tibet and (2)
e north-east where the border is the so-called
hon Line. This line was drawn on the map
British official of that name at the time when
was weak and it has never been agreed to
hina. Here too the inhabitants are more
in religion, habits, and appearance to the
ans than the Indians. The area of Ladakh
the Chinese claim links Sinkiang with
ern Tibet (both in China). The Chinese
rnment announced a cease-fire and the situa-
has remained quiet since. Both China and
appear to have an arguable case on histori-
eographical, and judicial grounds.

ia: twenty years on.—Since independence
has gone through critical times. She has
ed several bad years of harvest, including
rought years and, more recently, not only
at of famine but an actual attack of it. She
een involved in two wars. She has lost two
Prime Ministers—Nehru and Shastri. Her
cy has been devalued. Let us look first at
despite all this, she has achieved. Her
rial output in the last fifteen years has been
sed by one and a half times. Agricultural
t has increased by two thirds in fifteen years.
can take pride in her hydroelectric dams and
irrigation schemes, her oil refineries, steel plants, airlines, nuclear power projects, and so on. Schools have been trebled and the literary rate of 15% at independence is now 30%. But observers note first a feeling of disappointment in the country and a lack of faith in planning; and second, a feeling of hurt national pride. Taking these two streams of feeling in turn: the first, it is said, springs from a lack of will and resources in making effective new farming methods and methods of family planning, health and hygiene and this becomes increasingly critical as the population climbs to 500 million. The second element in national feeling is equally tragic, the feeling of hurt national pride, the loss of confidence in some countries which India had relied upon for friendship. The shock of the conflict with China in 1962 brought understandably a sense of disillusion and this was intensified when she became convinced—in her difficulties with Pakistan—of partisanship with that country of certain countries from whom she had expected sympathy. This general disillusion has forced her back upon the domestic problems which need attention; and this explains, it is said, India's apparent apathy to external problems like Vietnam. There is thus no strong interest in Afro-Asian co-operation or even in the Commonwealth. She is dependent upon the United States for food and aid, and her main concern is the threat from China and Pakistan and this concern fosters a demand for an Indian bomb.

The Indian Elections, 1967.—The monopoly of power enjoyed by the Congress Party of Gandhi and Nehru over India for twenty years was dramatically broken in March 1967. Between 60 and 70 per cent of the Indian electorate of 240 million used their vote. Half Mrs. Indira Gandhi's Congress Cabinet lost their seats, as well as three of the most powerful Congress Party leaders. Several State Governments were overturned. The result represented therefore an emphatic protest vote against continued Congress rule rather than a positive choice of a clear alternative vote. The protest vote went to whichever party seemed locally most capable of turning Congress out. The Congress Party was left with a very thin majority; but it remains the largest single party in the country and the only one, apart from the Communists, operating on a national scale. Mrs. Indira Gandhi was unanimously re-elected Prime Minister of India for a five-year term.

China.—It is only in the last fifty years that the people of China have emerged from centuries of exploitation. It is very difficult for a Western observer to appreciate the dramatic changes which followed the overthrow of the repressive dynasty in 1911 and the advent of the Republic next year. The new leader, Sun Yat Sen, a great idealist and humanitarian, pitted himself against the age-long combination of landlords, military men, and reactionary scholars. For all his achievements Sun failed; or rather Sun's party, the Kuomintang, failed him. Power passed to the military remnants of the old Imperial army and Sun did not succeed in giving his party teeth for militant action for reform. Unfortunately, two years after Sun's death in 1925 his successor General Chiang Kai-shek opened an anti-Communist drive.

Sun's exhortations had been taken to heart by a poet and a scholar, Mao Tse-tung, son of a yeoman farmer from Hunan in the heart of China. Mao's success in raising peasant armies established his pre-eminence as a leader. The countryside helped the Communists to develop honest government. The peasants were ready to work in field and forge. They created a people's army superior to all other armies in Chinese history. Mao takes his place as the great leader of the Chinese Revolution.

Mao-Tse-tung and Other Leaders.—Mao's reputation is based upon his ability first as a military theorist (of guerilla warfare); second as a political philosopher (adapting Marxism to Chinese needs); and, third, as a more ardent champion of world revolution than the Russian leaders. Chou En-lai, the premier of the State Council, is the best known of Chinese leaders in the outside world and also knows the outside world better than his colleagues. It was reported that Lin Piao had been appointed to succeed Mao in due course. Lin Piao is 57 and is an extremely able Minister of Defence but suffers from poor health. The Red Guards are said to have demanded the impeachment of Liu Shao-chi, hitherto Mao's right-hand man, and Teng Hsiao Ping, secretary-general of the Party.

China's Cultural Revolution.—What were the features of China's cultural revolution, as it was called, of which so much was heard in 1966 and 1967? We first briefly indicate the main elements: (1) it was an organised demonstration of the young; (2) it was in favour of Mao-Tse-tung; (3) it disseminated Mao's essential teaching; (4) it was intended to keep alive revolutionary fervour; (5) it thus engendered a sense of China's special path of development; and (6) it emphasised opposition to "revisionism" leading to "bourgeois decay" as, it was said, had occurred in Russia. When Mao himself in December 1965 gave the first hint of a coming purge he styled it a "cultural revolution" against bourgeois and revisionist elements. Let us amplify the main elements in the movement.

Youth Emergent.—The organisation was directed to the under-25s who joined in mammoth demonstrations. Slogans and portraits of Mao appeared everywhere. Huge crowds of young people with red armbands thronged the streets in general excitement. Red Guards took a prominent part. This tremendous emotional support for Papa Mao gave that leader (then 73) the assurance that his choice of successor would be accepted with confidence. Mao's essential teaching was disseminated by millions of copies of a little 300-page book of his selected writings, in a red plastic cover, carried by almost everyone and universally quoted, discussed, and preached. An objective of the movement was to stimulate the young who might otherwise take for granted the achievements of their elders made possible only by their suffering and hunger. The revolution must be uninterrupted; the class struggle continues. This revolution was set upon a special path, being opposed to the super-Japan western-type technological society. At the same time the cultural revolution emphasised opposition to bourgeois attitudes and encouragement of revolutionary fervour. Beyond all this the young were urged to show initiative, to make suggestions for improvements, not to be afraid to criticise. The upheaval was described as a militant and not a militarist movement; the weapons being the tongue, the pen, and the brush justified, it was argued, the description of the revolution as a cultural one.

A Return to Moderation.—In the winter 1966–7 it was impossible to discern clear outlines in the confused reports of upheavals in China. By March 1967 it was held by Mr. Victor Zorza of *The Guardian* that a gradual return to moderation was already evident in Chinese internal policies and that this gradual return was unlikely to be checked. It was being increasingly believed that the left-wing "cultural revolution" had been defeated. It was believed, also, that an important section of the leadership had favoured the revival of an alliance with Russia. (Relationship with Russia had become increasingly embittered since 1958 when Russia had refused to support China in a possible Communist takeover of Formosa. Since then Formosa has not been used as a springboard for invasion of the mainland, despite the opportunity afforded by three years of famine or the half year of confusion ending in the spring of 1967.) If, as seems possible, the dispute ends between left and right wings, the newspaper reader will ask himself, as events unfold, whether the Sino-Soviet dispute shows signs of being softened and, possibly, dissolved.

China Tests a Nuclear Missile.—In October 1966, without giving details of the weapon, China announced she had tested a guided missile with a nuclear warhead, thus conforming roughly to t timetable for the development of her missil nuclear capability anticipated by U.S. Intelligen studies. The Chinese announcement reiterat the assurance that China would never be the fir to use nuclear weapons. China made her fif nuclear test in December 1966, involving therm nuclear material.

China and the UN. *See* **Part II.**

The Background to Border Disputes.—All t central Asian peoples—Mongols, Tibetans, a Moslem Turki peoples—were conquered by Russ and China in the eighteenth and nineteen centuries and they drew an arbitrary line throu their lands, partitioning, in effect, Central Asi Both countries are now settling millions of peop into the provinces of those people. Russia settlers in Kazak number some 40 million peop outnumbering the Kazakhs themselves. China settling millions of Chinese in Mongol areas a Turkistan. When differences arose betwe Russia and China in 1960, the Chinese recalled th the Sino-Soviet frontier had been shaped by i perial Russia's pressure on a much weaker o China; and in the following years border frictio became more frequent. In 1964 a joint co mission did not arrive at any agreement and ha not met again by 1967.

Some salient facts should be noted. The Sovi Union has 220 million people increasing at t rate of 3 million a year, striving to fill and devel the empty spaces of Siberia; China has over 7 million, increasing at the rate of 20 million a ye and with much less space. The Communi régime of Russia has had an innings of fifty yea in which to grow; China has had a mere spell eighteen years, since she won, in 1949, the Chine civil war, exhausted and ravaged after decades domination, invasion, and finally the civil w itself.

Vietnam.—In 1941 the Vichy Government France gave Japan, who was our fighting ene in the Second World War, permission to u French Indo-China as a base against us. Resi tance groups were formed to win back indepe dence and to overthrow both French and Japane fascists. Japan collapsed in 1945, when the on organised troops were controlled by Ho Chi-min a Communist, who set up a Democratic Republ in the northern part of Vietnam. France w bent upon restoring her colonial empire in t south and next year war broke out between t French and Ho Chi-minh. Readers will rememb the dramatic seige and capture by Ho's forces the fort of Dien Bien Phu in 1954. As a result a 14-nation conference on Indo-China at Gene in the same year Vietnam was partitioned after cease-fire, the country to be united after fr elections. Laos and Cambodia became ind pendent.

A declaration taking note of the agreement w signed by the following nations who took par U.K., France, China, Russia, Cambodia, Laos, a North Vietnam. Unfortunately the Unit States refused to sign the agreement and Sou Vietnam refused to hold elections, but bo affirmed that they would not use force to ups the agreement. There was thus a crystallisati into two Vietnams—Ho Chi-minh's Han régime in the North and that of the Catho nationalist Ngo Dinh Diem at Saigon in t South. The Diem régime was corrupt but Jo Foster Dulles sent in men and materials to pr it up. By 1960 the Communist guerrillas in t South, known as the Vietcong, had set up National Liberation Front. For eight or ni years a civil war was waged in South Vietna against a very unpopular dictatorship. All th time it has received United States military supp and phrases like "the defence of freedom" Vietnam are to be construed in the light of th fact. It is true, of course, that the North has be helping the rebels in the South. The positi became increasingly untenable, and in 1963 t Buddhists rioted against the ruling Rom tholic minority. The Diem régime which had vagely persecuted the Buddhists was over- rown by the military, the first of a number of litary coups. In August 1964 a vessel of the S. fleet was attacked in the Gulf of Tonkin f the North Vietnam coast) and American anes bombed North Vietnam installations as aliation. This was the first of a series of bomb- raids. At first the U.S. Government said that ese were tit-for-tat raids but this specific basis s superseded by unrelated attacks. In March 65 the American Ambassador in South Vietnam d that pressure against Hanoi would continue ntil the enemy gives in." In June 1965 the ate Department gave authority to the American litary commander to use troops in offensive erations against the Vietcong.

U Thant at the United Nations, General de ulle in France, and important circles in the ited States publicly demanded the reconvening a conference, possibly by Russia and Britain o were co-chairmen of the Geneva conference 1954.

The Vietnam crisis illustrated how the political ntre of gravity in the world has changed. The st crucial division is no longer the East–West d war. A new pattern is being traced by the rit of Afro-Asia, comprising some seventy ntries of 2,000 million people.

ndonesia.—In August 1966 an agreement was ned between Malaysia and Indonesia ending three year " confrontation " between the two ntries. The whole direction of President karno's policy was reversed during 1966 by neral Suharto, chairman of the praesidium of nisters and Army C-in C., even though Sukarno s allowed to retain his powers as Head of State. spite the President, Sukarto brought Indonesia ck to the United Nations; ended the confron- ion with Malaysia; restored some semblance of nocratic government; and began to halt in- ion. Sukarto had taken control when the ny defeated a Communist coup in September 5. At the end of 1966 the political battle had ended between Suharto and Sukarno, who was l admired as the architect of Indonesia's ependence.

frica's Faltering Steps to Unity.—Only 18 out 8 Heads of State attended the Summit meeting he Organisation of African Unity in November 6 and of these six left before the end, more or on a discordant note. The meeting foundered the dispute following Ghana's detention of nea's delegation while in transit at Accra. Summit was unable to agree on recognising overnment in exile of the Rhodesian national- because of their split into Zanu and Zapu. sident Nyerere confessed sadly that " Africa is mess ". The disunity extends beyond Africa the whole of the non-aligned world which eared to have so much cohesion at the Bandung ference of 1955. What is the cause? Is it the ppearance of forceful leaders like Sukarno, rumah, and Nehru, and the fact that men like and Nasser are not in the mainstream of and Africa? Does the disunity support rumah's contention that without his form of tancy Africans can only be pawns of the neo- nialists? Has the leap to statehood been too ck? We must hope that the potentially rich ntries of Nigeria, Zambia, Ghana, Guinea, the ry Coast, and the Congo will plan development poorer neighbours. But a little perspective be salutary for European observers. After y centuries Europe has not yet completed by ry long way the evolution of nationalism, in- rialisation, and supranationalism; the process frica has been at work only for about a couple decades. We have insufficient reason to be satisfied; and future wellbeing both of our- es and other peoples calls for understanding.

ar in the Congo.—Rebellion and chaos con- ed in the Congo throughout 1964. Un- nately the African States had not insisted retaining a UN presence in the Congo or themselves supplied the help needed to keep the country functioning properly. Matters were brought to a climax by killings in Stanleyville, in Orientale province, from which a Belgian–American air mission rescued a number of white people in November 1964. Tshombe's employment of white mercenaries from South Africa had added to the bitterness in the country. It was recalled that Tshombe had previously called in Belgian paratroops—in 1960; and the arrival of these troops had enabled him to declare the independence of Katanga and, with European support, to maintain the secession for two and a half years.

Tshombe.—It is difficult to deal adequately with Moise Tshombe in restricted space. His change in 1964 from rebel and outcast to Prime Minister of the Congo came as a shock and surprise. He had failed, as a rebel, to secure the independence of Katanga, the richest province in the Congo. It was in that province that Patrice Lumumba, the first Prime Minister of the Congo, was killed in 1962 while in detention near Elizabethville, the Katangese capital; and according to a United Nations Commission, Tshombe's Government directly or indirectly contributed to his death. At the beginning of 1963, after two outbreaks of fierce fighting with the UN, Katanga had been forcibly brought back into the Central Government and in June of that year Tshombe went into exile. Throughout Africa his name carried the same significance as Quisling's in Occupied Europe in the second world war. Gradually, however, without once visiting the Congo he was able to attract allies to make him a strong rival to the Prime Minister, Adoula; and with the support of President Kasavubu and partly on the support of General Mobutu's Army he supplanted Adoula in 1964 and stood where Lumumba had stood just four years earlier. However, Kasavubu forced Tshombe to resign as Prime Minister in October 1965. President Kasavubu was himself replaced by General Mobutu soon after (November 1965). Neither man could be regarded as very competent; but Kasavubu had at any rate remained in power for five years.

Mobutu Takes Over Copper Operations.—At the beginning of 1967 President Mobutu took over the entire Congolese operations of the Belgian Union Minière Company which for 60 years had mined copper and cobalt in Katanga. This " congolisation " was described by the company as " the largest grab in history ". During 1966 there were two interesting declarations from the capital, Kinshasa (the new name for Leopoldville—Kisangani being the new name for Stanleyville): (1) in June 1966, the 6th anniversary of Congolese independence, Patrice Lumumba, assassinated in 1961 was declared a national hero and (2) that presidential elections would be held in 1970 by universal adult suffrage, including women. Tshombe (who now lives in Madrid) was said to be organising a return to power in 1967, making Katanga his goal rather than the Congo as a whole. He was said to feel certain that neither the United Nations nor the United States would make a fresh attempt to block Katanga's secession. Meanwhile, at the time of writing (March 1967) Tshombe was being tried in his absence on charges of high treason.

The Assassination of Verwoerd.—Dr. Verwoerd, who was murdered in September 1966, while the members of the Commonwealth were assembled in Conference in London, was the man who gave form and substance to the idea of apartheid, led South Africa into a republic and took her out of the Commonwealth. He studied applied psychology in Germany and on return took an interest in politics, organising in 1936 a protest against the admission to South Africa of a shipload of Jews fleeing from Germany. He became a power behind the scenes in the Nationalist Party which, in 1948, ousted the Smuts régime on the slogan of apartheid. He succeeded J. G. Strydom as Premier in 1959, a year after being elected to the House of Assembly. The Bantu Self Government Act of 1960 provided for the division of the non-white population into tribal units, the abolition of their existing representation in Parliament and the creation of self-governing "native states." But the aim of apartheid, the physical separation of races is, apart from other objections, a dishonest myth, as the economy cannot be run without black labour. The call by The Pan-African Organisation for a nationwide campaign against the law requiring all African men to carry passes for identification led to the massacre by the police at Sharpeville. Verwoerd banned the two major African political movements, the African National Congress and the Pan-African Congress and most African leaders were sent to prison, proscribed or fled. Verwoerd was born in Holland, a land noted for its enlightened policy of racial integration; but after his return to South Africa from Germany he held the separation of races to be blessed by scriptural authority and, as a follower of the Dutch Reformed Church, carried his philosophy into politics.

South Africa.—A Bill was due to come before the South African Parliament in 1967 which would make it illegal for any member of one racial group to participate in political activity of any kind with another racial group. It was called "The Improper Interference Bill." Such a measure would make illegal the activities of such a body as the National Union of South African Students which in 1966 had invited to South Africa Senator Robert Kennedy whose visit had such a great impact.

UN and the Freedom of S.W. Africa.—At the General Assembly in October 1966 Lord Caradon said that not only had the South African Government refused to submit to UN supervision but had continued to deny, in spite of pronouncements by the World Court, that the mandate was still in force. "They no longer have the right to carry the sacred trust conferred on them," he said. He went far in regretting the decision of the World Court in July 1966 which ruled that individual states (Ethiopia and Liberia were the applicants in the case) did not possess the "legal interest" to claim a binding decision. "It was highly desirable," said Lord Caradon, "to demonstrate to the world, and to the South African Government in particular, that the judgment given by the Court in July was in no way a victory or justification or vindication for the South African Government . . .". Lord Caradon did not go so far as Mr. Goldberg, the American Ambassador to UN who made the practical suggestion of a UN commission to recommend, as quickly as possible, how an administration could be set up. Lord Caradon had made no practical suggestion about how the 480,000 Africans of S.W. Africa could be led to self-determination alongside the 80,000 whites. Mr. Goldberg said the World Court had clearly defined the legal status of S.W. Africa in earlier opinions.

Cuba and the United States.—In 1961 the United States broke off diplomatic relations with Cuba with whom relations had been strained since the Castro revolution of 1959. Shortly afterwards two U.S. aeroplanes, but manned by Cubans, attacked the principal military bases near Havana, the capital. Two days later 1,500 invaders, Cuban exiles—armed, trained and largely controlled by U.S. agencies—landed on the island but were driven back. The United States intelligence service had assumed that the Cuban people would rise against Dr. Castro directly they heard of the landing. Controversy broke out in the States. Confidence in the new Kennedy administration was shaken for the affair was fundamentally alien to the American character. Relations were more bitter than ever, and, by the end of 1961, Cuba became a Communist state in the full sense.

The Cuban Crisis of the Autumn 1962.—The world came to the brink of war during the last week of October 1962. President Kennedy had pledged the United States to take measures to oppose the creation of offensive military power in Cuba. On 22 October, upon alleged evidence of offensive Soviet missile sites there, he announced a blockade of ships (or more precisely a quarantine of ships) carrying weapons to Cuba. Some Soviet ships altered course thus avoiding a direct confrontation. The United Nations made proposals to both sides in preparation for talks; and shortly afterwards Khrushchev decided to dismantle Soviet missile bases in Cuba and ship "offensive weapons" back to the Soviet Union, the United States agreeing to give assurances against an invasion of Cuba which had been threatened.

France and de Gaulle.—One of the biggest changes in France after the war was the wiping out, as a serious factor, of the Radical Socialist party so powerful before the war. The newspaper reader must not be misled by the titles of foreign political parties—the Radical Socialist party was not radical and it was not socialist, giving those terms the meanings they have in England. They never regained their place in the Fourth Republic which spanned the years 1946–58. There was one hopeful spell when Pierre Mendès-France made a vigorous attempt to reform the party. In 1958 General de Gaulle, who had had a brief period of power in 1945–46, established a semi-presidential system with himself as President, taking certain powers away from Parliament and thus opening France's Fifth Republic next year.

De Gaulle Elected for a Second Term.—The French President's seven-year term ended in December 1965 and although he had then reached the age of seventy-five he submitted himself for re-election. He was opposed by two candidates who needed to be taken seriously (M. Mitterand and M. Lecanuet)—certainly in their combined effect—and two negligible candidates. De Gaulle took the encounter rather too casually and was forced to fight a second and straight fight with M. Mitterand, the left-wing candidate, who had secured the second position in the first ballot. De Gaulle won, as was to be expected, but had to content himself with 55·2 per cent—13 085,407 votes against M. Mitterand's 10,623,247.

What has de Gaulle achieved?—What, despite his questionable methods, did de Gaulle achieve during his first term of office? First he steadily brought the war in Algeria to an end, despite all the hopes reposed in him that he would suppress the independence movement. This was a tremendously courageous achievement; and what was equally courageous he brought France through the threat of civil war precipitated by those who were for continuing force upon Algeria. The drive to economic recovery had, it is true, commenced before he came to power. But on the political side he reasserted French spirit and struck out upon a lonely path, building his nuclear force without receiving technical knowledge from America (as we had).

De Gaulle's Reckoning with the "Anglo-Saxons."—The key to de Gaulle's foreign policy is his conflict with the Anglo-Saxon allies, against whom he had fought all through the war itself. A narrative and an analysis of his "hour of reckoning with the Anglo Saxons" will be found in an unusually compelling and revealing biography *The Three Lives of Charles de Gaulle* by David Schoenbrun (Hamish Hamilton). (The three lives, very different ones, are de Gaulle as a soldier in the Third Republic, as the liberator in the Fourth Republic, and as the creator of the Fifth Republic.) Mr. Schoenbrun's thesis is that de Gaulle, from June 1940 to May 1945, had fought a war within a war, an uncivil war with the Anglo-Saxons behind their united front against the Axis powers. De Gaulle alleged in his memoirs that the war-time allies, freed of the necessity of union inst the common enemy, set themselves "to egate us to a secondary place among the nations ponsible for conducting the peace." He added, have no intention of letting this happen." us the first uncivil war lasted five years, from 0 to 1945; the second uncivil war broke out in 8 and is now—in 1967 in its ninth year. It grown more uncivil each year. The boiling nt of the first was the intervention of British ops against the French in Syria in 1945. It never forgotten, and the uncivil war broke again in 1958 when de Gaulle returned to ver. The conflict was the more open because that time the fear of Russia and of China, which ght have bound the Anglo-Saxons and France re closely, had diminished.

The Right to Participate in Decisions.—Re- very by France having been accomplished by 8, de Gaulle was determined that France uld "assume its historic rôle in world affairs." could therefore no longer assent to delegating the U.S. exclusive authority to make the vital isions for the defence of the free world every- ere in the world. He wanted not only the right participate but the official and public recogni- n of that right by the creation of a three-power anisation to take joint decisions on global pro- ms. The United States declined. Next year ne de Gaulle's next step—the withdrawal of al units from NATO's Mediterranean Com- nd. The following year, 1959, de Gaulle an- nced that France would proceed to build an ependent national atomic force. In 1962 when nnedy proposed Atlantic partnership with rope, de Gaulle replied with a plan to group the stern European nations into "an organisation t would be one of the three powers of the net." In January 1963 de Gaulle rejected an er by Kennedy to make American *Polaris* siles available to them but to be assigned to a ltilateral Atlantic force. Macmillan accepted imilar offer at the Nassau Conference. The ision between de Gaulle and Macmillan was reupon wide open. At the beginning of 1963 General slammed the door to the Common rket in Macmillan's face and refused to sign the mic test-ban treaty. Exactly a year later de ulle recognised Communist China which must e angered the United States deeply. In 1965 Gaulle left SEATO the South-east Asia Treaty anisation; and next year NATO was asked to ove its headquarters from France. The agree- nt in January 1967 between Britain and France go ahead with the variable geometry swing- g fighter plane and to collaborate in building copters was hailed as a hopeful angury.

rance and Russia.—De Gaulle received an husiastic welcome in Russia in the summer of 6. A "hot line" was established between the sée Palace and the Kremlin, de Gaulle thus ring parity on this facility with Washington. Franco-Soviet Space Pact allowed for co- ration in space science, meteorology, and tele- munications, and provided for the launching French scientific satellite by a Soviet space ket. Mr. Kosygin returned the visit in Decem- when the two leaders repeated the theme of a peace in Europe being attained through stages létente, entente, and co-operation. But there no mention of Germany in the final communi- , indicating that France and Russia were still osed on the question of recognition of East many. And there seemed no agreement on lear non-proliferation.

denauer and Western Germany.—A notable onal achievement of the last two decades was Konrad Adenauer's Chancellorship of the West man Federal Republic for fourteen years until retirement in October 1963 at the age of 86. gave to a people who had not known demo- ic government for 15 years a new confidence self respect. He committed himself to con- tional government despite the fact that he a natural autocrat. Under him Germany yed the first period of stable government the First World War. As a consequence of new confidence Germany rebuilt prosperity from decay. His work in building a special relationship with France, culminating in a treaty of friendship, was a dramatic contrast to the long tradition of enmity with France through which he had lived. But while he succeeded in building his country into the Western community he remained intransigent over East Germany; and since a solution must be found it remained for a more imaginative successor to grapple with it.

Erhard and Kiesinger.—In September 1966, when financial troubles were developing, Dr. Erhard, Chancellor, tried to amend the constitution so as to curb the financial powers of the Länder. For this he needed a two-thirds majority in the Bundestag, which he could not secure. His place was taken by Dr. Kurt Kiesinger, Germany's third post-war Chancellor who was able to take office only by the fact that the Social Democrats agreed to join the Christian Democrats. Dr. Erhard had become Chancellor in 1963 as the most popular politician in the country; he left when Germany's rôle in world affairs was undecided and its internal political future dangerously uncertain. Erhard was a determined opponent of hysterical nationalism and was a loyal supporter of the Atlantic Alliance—indeed it was held that he encouraged ties with the United States at the expense of the Franco-German friendship treaty, which had not lived up to the hopes reposed in it. It was this factor which accounted for the enmity of the Bavarian wing of the Christian Democrats, called the Christian Social Union, the party of Herr Strauss. The C.D.U. put its weight behind Dr. Kiesinger's nomination for the Federal Chancellorship and Herr Strauss was suitably rewarded with a Cabinet post.

A Turn to the Right.—An extremist Right-wing party made a sensational and disquieting success at the polls in 1966. In 1965 a public opinion poll showed that 60 per cent of the electorate had never heard of the National Democratic Party. In three months of the autumn of 1966 it grew in membership from 19,000 to 22,500 and then the whole country knew of its existence for it won 8 seats in the State Parliament of Hesse. Its organiser declared that if there had then been a Federal election the party could have captured as many as 50 seats. The Free Democrats, the unpredictable third force in West German politics, left the Coalition Government in October 1966. It had had four Ministers in Erhard's Government.

The Assassination of President Kennedy in November 1963 at Dallas, Texas, shocked the entire world. The world recognised the growing mastery which this young man had shown during his three years of office in leadership and commitment to policies which promised increasing conciliation among nations. His youthfulness had galvanised hope in a world in which political decisions were so widely in the hands of leaders past their prime. He was the youngest American President (43) when he succeeded Eisenhower at the White House in January 1961, Eisenhower being then America's oldest President. Kennedy had had difficulties with Congress; and it was reassuring, therefore, that Lyndon B. Johnson, who as Vice-President automatically succeeded Kennedy, should have had the reputation of being a skilful negotiator in Congressional matters.

The Defeat of Goldwater.—Barry Goldwater, the Republican candidate, was decisively rejected by the American people at the Presidential election in the autumn of 1964. Lyndon B. Johnson, Democrat—"Ell Bee Jay"—had a majority of 15 million over Senator Goldwater.

In the new House of Representatives in 1964 was the largest number of Democrats since the Roosevelt New Deal years of the early 1930s. Thus President Johnson was given much greater prospects of enactment of his legislative programme. The United States is now committed to an expanding programme of civil rights for Negroes.

Turn of the Tide for Republicans.—The mid-term elections in 1966—that is to say the Congressional election which falls between two Presidential elections—gave a shock to the Democrats and gave the Republicans three assets: (1) a strengthened minority in the House of Representatives which would restrain any further welfare spending, thus blocking progress of such Great Society legislation as medicare; (2) invasion of Republicanism in the South, for so long the one-party servant of the Democrats; (3) a revival of the regional strength of the party by winning the Governorships of five of the six States that carry to the Presidential nominating conventions the biggest blocks of delegates. The state of the parties were:

	New Senate	*Old Senate*
Democrats	64	67
Republicans	36	33
	New House	*Old House* *
Democrats	248	294
Republicans	187	139

* there were 2 vacancies (one D one R) at the dissolution of the old House of Representatives.

The Significance of the Election.—The election gave no new signs about Vietnam. There was no marked division between the parties on the war. But the result expressed conservative resistance to any further progress towards the " Great Society." It confirmed the trend which had already been shown by the defeat in Congress—the first major Civil Rights Bill to be defeated in recent years—of the Bill to end racial discrimination in the sale and rental of housing. The outlook became bleak for human rights.

The Republicans Back On Their Feet.—Thus the mid-term election of 1966 rehabilitated the Republican Party which had been so sundered by the rout of Goldwater in 1964. It removed the balance of power from Goldwater and put it in the hands of more moderate men. It warned the Republican Party against again putting forward extremist candidates like Goldwater. The large gains in the number of Republican Governors provided that party with a short list of Presidential candidates both for 1968 and 1972. Among these were Nelson Rockefeller (New York) and Romney (Michigan); but an alarming figure was the extreme Right-wing Ronald Reagan (California). The emergence of Reagan was the shock of the election—a minor film actor, sports announcer, Goldwater man, whose administrative abilities and convictions remained mysteries. He would fall to be considered for the 1968 Presidential nominations, and it remains to be seen whether the Republican Party before that time will concentrate on a more moderate candidate. The outstanding Republican winner was Richard Nixon who has been Vice-President and a Presidential candidate. In the words of Alistair Cooke, Nixon has the art of being all things to all the men (Congressional candidates) who are greatly in his debt.

The Struggle between Robert Kennedy and L.B.J.—On the Democratic side a great drama unfolded in the struggle for power between President Johnson and Senator Robert Kennedy, the brother of the assassinated President John F. Kennedy. *The Times* said that the like of it has, perhaps, not been seen since mediaeval times. The Democrats were no longer united. The Kennedy family were seen to be challenging Johnson's succession. At the opening of 1967 President Johnson's popularity had slumped.

4. THE THREAT OF NUCLEAR CONFLICT.

Terms Used.—

A deterrent is a weapons system capable of causing such a degree of destruction to an attacker that it would be too high a price for him to pay for any advantages sought. Of course, the attacker may not know what destruction the deterrent could cause, so that what is important is not the owner's estimate of his deterrent but the potential aggressor's estimate of it. Furthermore. deterrent forces must be able to strike back after an aggressor's missile attack. So there is a distinction between first and second strike weapons. The nuclear deterrent is said to be the ultimate deterrent, because nuclear weapons are the most advanced form of weapon.

The nuclear or thermonuclear bomb means a bomb or a missile with an explosive power measured in megatons, *i.e.*, one million times more powerful than bombs used during the Second World War. A ten megaton bomb contains the equivalent of a train of railway wagons filled with high explosive stretching from London to New York—and of course fall-out with its genetic effects.

The independent bomb. Independence, in this context, means the right and ability to launch a force alone against an aggressor. For this it is necessary to own and control thermo-nuclear weapons and be able to deliver them. The ability to deliver weapons without which they are useless as a deterrent raises crucial difficulties.

It is argued that the bomb, like earlier types of armament, is the ultimate guarantee of the nation's security; that without it we should not reach the conference table with other great powers; that it gives us freedom of action and, as such, is a safeguard against the possibility of a change in American policies which might leave us unprotected. The facts and policy of an independent nuclear deterrent have been seriously challenged.

AMB is the anti-ballistics missile defence system, whereby missiles are launched to destroy the missiles of the enemy—anti missile missiles. At the end of 1966 it was known that the Russians had begun to establish an anti-ballistics missile defence system round Moscow. President Johnson was then under pressure to counter this with the deployment of an American ABM system which was already under development. This would entail tremendous cost. Moreover both the U.S.S.R. and U.S.A. realised that an ABM system can be countered by increasing the number and penetration of offensive missiles. Mr. Johnson in 1967 therefore proposed discussions between the two countries designed to prevent a race in anti-missile defence; and in March of that year the two countries agreed to discuss ways of limiting the race in both offensive and defensive missiles. The significance of the inclusion of offensive weapons lies in the fact that the U.S.A. has a three to one superiority over the Russians in offensive missiles.

Other terms. *Escalation* is a term used for the belief that once a conflict begins which involves nuclear powers, the contesting parties are riding on an escalator from which there is no escape and rising to an all-out thermonuclear war. A weapon is said to be *credible* when it is trustworthy and it can be believed in for its purpose: thus it is sometimes said that the U.K. manned bomber force is credible only for a first strike. *Conventional* weapons and forces are other than nuclear. Atomic devices are described as *tactical* when they are in support of ground forces and *strategic* when they are part of an all-out major strike force.

The Partial Nuclear Test-Ban Treaty was signed in Moscow in August 1963 between Britain, the U.S.A., and the U.S.S.R. who undertook not to conduct nuclear tests in three out of four possible

eres—in the atmosphere, in outer space and
er water. The fourth possibility—under-
und tests—was not touched by the Treaty, but
eclares that agreement on such tests remains
esirable aim. Within two weeks 62 further
tes had signed it. President de Gaulle was
otical. Since Russia and the U.S.A. had, he
, made hundreds of tests, some quite recently,
lid not see what purpose new tests could serve.
put his finger on the fact that underground
s were not covered. The Treaty was de-
nced by China who wanted, she said, total
hibition and destruction of nuclear weapons.

nderground Nuclear Explosions.—There has
n little hope of extending the test-ban treaty
nderground explosions, despite the appeal of
United States to Russia to agree. The U.S.
Britain still disagree with Russia over the
stion of identifying the nature of all under-
und explosions. The Western Powers insist
no foolproof method has yet been devised,
they cannot therefore accept a ban on nuclear
erground explosions without a limited number
n the spot inspections. But this is just what
sia is opposed to, on the grounds that this
ld amount to espionage.
ritain failed in 1966 to win Soviet support for
British plan to bring Eastern and Western
ntists together to work out a foolproof system
banning underground nuclear tests. It was
erstood that Russia was opposed to the talks
g limited to British, American, and Soviet
ntists.

he Spread of Nuclear Weapons.—Ever since
) there have been talks on how to prevent the
iferation of the bomb and the round of talks,
ch ended in August 1966, finished without any
stantial new progress. The stumbling block
Russia's suspicions that despite declarations
America the arrangements to be made for the
re of NATO would give Germany a finger on
nuclear trigger. In the autumn of 1966,
ever, the outlook was slightly less bleak.
nges within NATO itself diminished fears that
nany would secure a physical share in nuclear
er. These changes were the virtual abandon-
t of the two plans which had been discussed
so long—MLF and ANF—plans for consul-
on through ministerial groups. (MLF was
proposal for a mixed manned force of surface
els and the ANF the proposal for an Atlantic
ear force.) Furthermore, it was argued,
nany would not wish to be thought of as a
or obstacle to a non-proliferation treaty. But
e non-proliferation talks time was running out.
as only on the test-ban talks that time was on
right side, since with time more effective
itoring devices are being introduced.

he Nuclear Disarmament Talks: Geneva, 1967.
alks were resumed about the spread of nuclear
oons at the 18-power Conference at Geneva in
ruary, 1967, where it was expected that a
et-American draft treaty would become avail-
for debate. The salient factors seemed to be:
Two countries—France and China—would not
nterested in such a treaty; (2) By forgoing the
to develop nuclear weapons countries must
reassured against nuclear threats, whether
rals like Israel and India, or allies like Ger-
y and Japan; (3) More was being asked of
nuclear powers than of nuclear powers. The
ear powers must, therefore, themselves fulfil
ations like banning underground tests, and
ng off the production of missile material.
negotiations between the U.S.S.R. and U.S.A.
t the anti-ballistic missiles (noted above) will
arefully watched; (4) The objection (urged
cially by Germany) that the Treaty would
a right of inspection of non-nuclear powers
and that this would give a substantial
ntage in the development of civil reactors
ower or export to the military nuclear powers.
nany feared that an industrial inspection rôle
l be used to forbid civil nuclear programmes
r the pretext that these increased Germany's progress towards nuclear arms. Voices in Germany went further: that nuclear weapons research is essential for civil progress. In reply it was urged that EURATOM and the IAEA (International Atomic Energy Agency) provide adequate sources of research and technological information. It is doubtful if Germany's resistance was based as much on technological considerations as on more complex political ones.

Nuclear Defence Affairs Committee.—This nuclear defence group was set up by fourteen members—excluding France—of the Atlantic Alliance. The new group includes West Germany as a permanent member and makes joint nuclear planning a permanent feature of the Alliance. The NDAC is open to all 14 members but Iceland and Luxembourg (which have no troops in NATO) and Norway (which does not permit nuclear weapons on her soil) were not represented when NDAC was first formed in December 1966. The committee of the remaining 11 was appointed with 4 permanent members—Britain, the U.S., West Germany, and Italy—and 3 seats rotating among the other seven, the first three being Turkey, Canada, and the Netherlands. The creation of the new group completes the work of the McNamara Committee set up to advise on nuclear planning arrangements. The U.S. took the view that the Soviet Union should in no way regard the new formula as involving a spread of nuclear weapons, since, from the Russian point of view, the risk that the West could start a nuclear war would be no greater than previously. The same fingers would be on the same triggers and it was clear that there must be an abandonment of any attempt to create a mixed-manned nuclear force under whatever name. There would be joint consultation and a measure of joint control but the weapons themselves would not be in German hands. But whether the Russians would regard themselves as reassured and, if so, to an extent to encourage steps towards a non-dissemination pact, remained to be seen. The NATO Defence Ministers had yet to work out how their new committee would secure swift consultation in a crisis—a very complex problem.

Nations and Nuclear Power.—The nuclear powers are U.S.A., Great Britain, France, Russia, and China. The powers with advanced nuclear technologies are Sweden, Israel, India, Canada, and Japan. Three other powers might obtain a nuclear capacity with external assistance; they are Western Germany, Pakistan, and the United Arab Republic.

Doctors Against War.—Under the conditions of political stress in the two years which preceded the Second World War, many doctors felt that they might have a special function in helping to stave off the emergency, or failing this, to mitigate its traumatic consequences in the population. Stimulated by the correspondence between Freud and Einstein on the hopes of peace, psychiatrists met and discussed problems of normal and abnormal group behaviour. In 1957 several groups were established to impress the public—and especially politicians—that scientists and medical doctors might have views on the problem of war prevention by virtue of their technical knowledge. This aspect was underlined by forceful spokesmen such as Russell, Haddon, and Rotblat. One of these groups was the Medical Association for the Prevention of War. The function of this group is to explore the causes and pathology of the war disease, so that logical and practical ways of prevention can be developed. In the words of Professor T. H. Pear: "In one sense, all causes of war are ultimately psychological, since they affect the experience and behaviour of those persons who decide to 'declare' war."

The Plan of Research.—The psychiatrists who had met in 1938 were impressed by the fact that wars occur in spite of a general desire for peace and concluded that precipitating causes were mainly psychological. Any explanation of causes of war which ignored deep-seated emotional factors was likely to be inadequate. Furthermore, the study of the problems of war demands from those who undertake it a close examination of their own motives. The following questions were among those posed for research:

(1) What are the psychological causes in the friendly or hostile relations between nations and other war making groups?

(2) What psychological factors may be recognised as common to different eve-of-war situations in primitive or civilised communities?

(3) What are the means by which propaganda mobilises public opinion in favour of peace or war? Is it possible for the powerful forces easily aroused to favour war to be directed to peaceful ends?

(4) Is it possible to apply to war-like nations methods similar to those employed to modify the aggressive tendencies in children (the object being to change these tendencies rather than simply to prevent their manifestation)?

The Medical Association for Prevention of War issues its proceedings twice annually and holds a summer conference and other meetings. Its president is Sir Alexander Haddow, its chairman Professor L. S. Penrose, and the Hon. Secretary is Dr. Martin Bax, 62 Hornsey Lane, N.6. The following passages are based upon publications by the Association. Before we pass to these we may recall that the study of conflict and aggression led to the famous series of Pugwash conferences on science and world affairs. Again the Institute of Biology held a symposium on the Natural History of Aggression in London in 1963 when an attempt was made to relate the contributions of a variety of disciplines to the problem of international aggression. A fairly clear picture emerged. Intra-species aggression is common in the animal world but under natural conditions this aggression is nearly always modified by devices such as ritualisation, appeasement gestures, and other actions which tend to avoid actual killing. However, caged animals or those confined by other pressures such as over-crowding, have been seen to destroy themselves utterly. Seen against the background of the animal kingdom overt fighting among men, which has led to about 60 million deaths since 1820 and which may seem " normal " to some people appears pathological. Two questions arise: Has man caged himself in an artificial environment analogous to that of captive animals? Will he use his intelligence and unique power of vision to prevent the world from becoming so overcrowded that only unhappiness, cruelty, and death can be the result?

The Prevention of War is clearly the most pressing task of modern society. In his famous book *No More War*, Linus Pauling tells us that of the 1,000 million people living in areas likely to receive strong atomic attack, 500 to 700 million persons are likely to perish within 60 days. No desease is capable of causing mass mortality and bodily injuries on a comparable scale. Looking at the other side of the picture, the armaments race costs mankind 150,000 million dollars annually. This is about half of the total capital invested each year in world economy and about two-thirds of the national incomes of all the developing countries put together. More than 20 million people are serving in the armed forces of the world, and more than 100 million are spending their energies on work connected with war. Seventy per cent of the world's scientific manpower is being used directly or indirectly for military purposes. Yet hunger and starvation are on the increase; and of the daily number of deaths 100,000 are still due to malnutrition.

Security Re-examined.—It became evident, about fifteen years ago, that no group on earth is defendable. No general or parliament can any longer assure his people or its country of safety from attack, no matter how heavily armed. Perhaps some retaliation can be promised, but not
defence, for we are too proficient in killing. Dr
Brock Chisholm of Canada who was Directo
General of the World Health Organisation plead
that security as a problem has changed it
character; we have relied upon the belief that th
survival of our family or nation depends on thei
ability to defend themselves against attack and t
attack other groups successfully. But, as h
argues, no group is any longer defendable. H
continues: " Many people still believe that, eve
though we are now able to kill everyone on earth
including ourselves, at least three, four or fiv
times over, if we could first arrange to be able t
kill everyone, including ourselves, say a dozen o
twenty times over, in some way we should b
more secure and not so frightened." Not sur
prisingly he calls this insanity. Although supra
national controls offer the only hope of huma
survival we still regard acceptance of such contro
as disloyal. Our failure to react to new circum
stances leads to the view that man may well b
now in much the same kind of situation th
dinosaur was in shortly before it died out. Th
dinosaur did not have sufficient thinking ability t
be able to arrange for its own survival. Man doe
have the capacity to think and react adequatel
if, but only if, he can free himself sufficiently fro
the controls of his traditions, all founded on ol
not present, situations and experience. We hav
no important tradition of concern for the welfa
of people outside our own areas of identificatio
The problem of war thus goes back to the earl
development of children and their learning tha
ancestral and parental attitudes and patterns a
right and good. The Constitution of the Worl
Health Organisation faces this problem by po
tulating as essential to the development of th
child " the ability to live harmoniously in
changing total environment." From now on w
shall survive as members of the human race or no
at all.

Chemical and Biological Weapons.—The Medica
Association for Prevention of War has reprinte
evidence of the increasing development and stock
piling of chemical and biological weapons. Th
chemical weapons which they are primarily con
cerned with, all toxic or noxious to man, fall int
six arbitrary categories. The first three group
are incapacitating but usually non-lethal; th
remaining three categories are lethal. The firs
three groups are irritating agents, vesicant agent
(mustard gas and lewisite) and psychochemical
Psychochemicals, also known as hallucinogen
lead to mental derangements. The substanc
most frequently discussed is LSD-25. The secon
set of groups include nerve gases. Dr. Victor W
Sidel and Dr. Robert M. Goldwyn, writing in th
New England *Journal of Medicine* (Jan. 1966
think that, of the chemical weapons, nerve gase
are the newest, the most effective, and the mos
likely to be used. Being odourless and colourles
they give no warning; they act rapidly an
effectively in low concentrations. A few in
halations can kill in one or two minutes. A
concentrations attainable under field condition
even a single inhalation can kill.

Biological Warfare.—Theoretically a multitud
of bacteria, viruses, fungi and toxins could b
used. Biological agents are invisible, odourles
and tasteless, and since they usually produce n
immediate physiological damage, early recognitio
is unlikely. They could overwhelm withou
damage to material things and civilian populatio
could be the prime target. The effects, howeve
cannot be completely predicted. Epidemi
disease or mortality might be caused on a sca
not visualised by the attacker. Biological agent
may make the human being not only a victim bu
also a propagator of the disease. Relatively in
expensive, they can easily be manufactured b
countries with limited industrial potential. N
general agreement to outlaw germ or gas warfa
exists today. The Fifth Pugwash Conference i
1959 recommended that a general internationa
agreement should be negotiated to prohibit the us
of chemical–biological weapons. But there ha
been little further debate on this subject, pa

arly among doctors; yet no nation could
lop this kind of warfare without doctors.

ientists and War.—The fact that Sir Solly
erman heads the hierarchy of scientific
sers to the Government made his book
tists and War (Hamish Hamilton) published
966 one of outstanding importance. He
ecates not only the folly of a strategic nuclear
but also the tactical employment of nuclear
ons—they are all part of the same spectrum.
tactical nuclear weapons must, in land war-
inflict heavy civilian casualties. His look
e next fifteen years concludes with the view
no new science is likely to affect the military
nce between the major Powers, except perhaps
he changes in the tighter control of military
ms which computers may bring. The im-
of science on political relations and through
on military affairs will be more indirect—
opulation explosion following antibiotics and
ene, new uses of natural resources and pres-
on them, and the growth of mass communi-
ns. While higher education is not necessarily
arantee of higher virtue or political wisdom,
olly argues for greater scientific literacy for
roper appreciation of the social functions of
ce. He believes in the human being as
sed to the machine. "The human brain,
an values, human judgments are still superior
he mechanics and processes of electronic
uters or guidance systems."

itain Appoints an Arms Salesman.—The
intment of a salesman of armaments, charged
the task of securing orders abroad for the
te firms manufacturing armaments, came in
as a shock to those who could not but call to
the ominous historic parallels since "mer-
ts of death", as they have been called, first
under public scrutiny. For example the
between Paraguay and Bolivia from 1932 to
, which decimated the manpower of both
tries, was kept going by arms firms pressing
wares on both sides; a British Royal Com-
on elicited that arms were sent from this
try to both combatants to the tune of over a
on and a half pounds. More recently Pro-
r John Galbraith, in evidence to the U.S.
te Foreign Relations Committee, gave it as his
on that American arms shipment caused the
between India and Pakistan in 1965. He
that if the United States had not supplied the
, Pakistan would not have sought a military
ion. Both Britain and the United States
nue to supply both sides. *The Times* of 10
1966 referred to a report that the Soviet
n had offered to sell arms to Pakistan on the
terms as she already sells to India. It was
st this sinister history that the Government's
ion was regarded by many people as immoral,
lculated to stimulate the arms race, and as
icting with the work of the Minister of
mament. The defence of the Ministry of
nce was: "All we intend by the creation of a
of Defence Sales is to assist British industry
tain its share of the existing trade in defence
ment without adding to the total volume of
trade and without in any way jeopardising
s to reduce it." The implication is that other
tries will sell if we do not. But it is possible
e a principled stand, such as our own decision
o sell weapons to South Africa, whatever
countries may do. If we refused to sell
it would strengthen our hands in trying to
treaties to stop arms imports into danger
, such as the Middle East, where the major
-exporting powers hotly compete for con-
s.

ter Space for Peaceful Developments.—An
national treaty to preserve outer space for
ful purposes was completed in December
It was described by President Johnson as
most important arms control development
the limited test-ban treaty of 1963." Mr.
son first proposed such a treaty in May 1966
when there had been extensive talks between the U.S. and Russia, the only two powers which are seriously involved in space research. The drafting of the treaty was prepared by the United Nations. It provides for rights of exploration in space for all countries; no claims of sovereignty over celestial bodies; no orbiting of weapons of mass destruction (already provided for in an earlier UN resolution); the preservation of space and all celestial bodies for peaceful purposes; and other procedures for peaceful co-operation among nations in space and in the exploration of space.

Conflict Studies.—Professor Rapaport of Michigan University distinguishes three approaches to the subject of tensions between nations. These are the cataclysmic, the strategic, and the ideological approaches. In the first, war is regarded very much as we regard forest fires and epidemics. It begins, spreads—like wildfire, as we, indeed, say—and runs its course. It looks as if it were self-propelled—like a dog fight—and goes to the end relentlessly unless stopped. The second approach is to discern the strategic kind of contest which nations seem to engage in all the time—so that Clausewitz was able to say that war was a continuation of policy by other means. The strategic contests which nations engage in by way of ordinary policy resemble games of chess or poker, a continuous battle of strategy to outwit the opponent. The third approach is to examine the opposition of views. Country A thinks the views of B are maleficent, and wants B to change or modify them. But A rarely goes about it in a fruitful way. Nor does B, C, and the rest of them. Verbal battles become intense but fiery speeches often have more effect on those at home than on those abroad. Professor Rapoport suggests we need to do more research on the way to conduct debates so as to achieve a real interchange of ideas. At present many political speeches at UNO and elsewhere are largely in the nature of ritualistic rhetoric; they whip up the speakers' own people and fall flat elsewhere. These three components represent the fights, games, and debates elements in conflicts. Is a science of conflict possible? Mr. Nicholson of Lancaster University says that the experience of the methods of other social sciences will be used in the exploration, from a new angle, of the causes of conflict and war in particular. From conflict studies at Chicago has come *The Study of War* by Professor Quincy Wright; from Michigan University Professor Rapaport's *Fights, Games and Debates* and the journal *Conflict Resolution*. In England, in addition to the research unit at Lancaster University, we have the Conflict Research Society (University College, London).

What do Nations Know of Each Other?—A science of conflict will doubtless examine the nature of the information available to us about other countries. We can too easily believe that with the complete and rapid means of communication of modern times we have only to press a button and all the facts and figures will shower into out laps. The press, wireless, and radio certainly feed us very fully. But volume is no guarantee of validity. It might be supposed that if there are many voices and many writers upon an event, the composite result would contain a true picture or that the truth could be easily selected from the stream of comment. But unfortunately this may be far from correct. To illustrate this we have only to remember the totally differing public opinions created in different countries about the same event; and we may contrast the result on public opinion of reports made at the time of an event and the very different verdict of a more objective analysis made a year or two later. Whatever we choose to look at—the Suez affair, Cuba, South Africa, the Negro problem, the "cultural revolution" in China—we know that prejudiced attitudes were persistently fostered and that despite the spate of word and picture, the truth was and is hard to come by. We know that many factors prevent the truth emerging—bias, deliberate or unconscious, the pressures of interests and national policy. A grave example of this can be studied in a very readable book *A Curtain of Ignorance. China: How America is deceived* by Felix Greene (Cape).

II. A CITIZEN'S GUIDE

This part explains the working of Central and Local Government and gives a summary of some rece
changes in the machinery of government and of the new regional planning organisations. It dea
with the Commonwealth, the United Nations, and Western International Organisations. Amo
the contemporary topics discussed are changes in Africa, and the constitutional and politic
implications of the Common Market (the economic aspects being dealt with in Section G, Part II
At the end is a list of Ministers in Mr. Wilson's Second Labour Cabinet as reformed in January 196
a full list of Members of Parliament and their constituencies; and a list of voluntary societies
particular interest to the citizen.

CENTRAL GOVERNMENT.

We devote most of our available space to recent changes in the structure of Government, but we recapitulate first a few basic facts. The skeleton of our democratic system, the way Government works (Parliament, the Civil Service, Local Government, the Judiciary) can be fairly simply described. Our constitution is not a written one so that we cannot refer to chapter and verse of an actual text. It is the actual working of the constitution that matters and this changes over the years in subtle, complex and often disguised ways. Thus the reader will find that books on this subject fall into two main groups. In the first are those which give the current outline or anatomy of Government. In the other group are a considerable number of books (all the way from Bagehot and Dicey) on how the constitution has evolved, what it needs to do, the dangers and efficacy of changes and so on. We thus have a whole range of treatises by jurists, historians, political scientists, and politicians analysing concepts, history, actual working of parts of the constitution, and comparisons with Government in other countries.

We are unique in having an unwritten constitution. Democracy is preserved by the ordinary law, by the political organisation of the people, by custom, and by rights which depend upon the capacity of the people to preserve them. The supreme law-making body is Parliament (a word which originally meant a talk). Parliament has grown from the original principle that in important matters such as making the laws the monarch ought not to act without counsel and consent, and it now consists of two Houses, the House of Lords, composed of lords spiritual and temporal, and the House of Commons representing the commoners. The principal share of parliamentary business is conducted in the Commons. Its business is divided into three branches: legislative, financial, and critical. The life of a Parliament is limited to five years, although, on the advice of the Prime Minister, the Queen may dissolve Parliament and issue a proclamation calling for election of a new Parliament. Parliament is adjourned from day to day while in session. At the end of the session it is prorogued. At the expiry of its life it is dissolved.

Legislation.—The law of this country consists of common law, statute law, and equity. One may describe the common law as that based on custom and usage as declared and expounded by judges. Statute law is the law made by Parliament, enshrined in Acts of Parliament or statutes of the realm. Parliament is thus concerned with the making of statute law. The classification of law is explained in Section D.

How Laws are Made.—Any member of the House of Commons may present a Bill after giving formal notice, but the principal Bills are those introduced by the Government based upon its programme outlined in the Queen's Speech.

The Bill has to pass three Readings before it can become law. The First Reading is a formality. The House gets down to discussion at the Second Reading when general principles as distinct from details are discussed. If the principles are approved, the Bill passes its Second Reading. It is then referred for detailed examination either to a standing committee or to the whole House sitting in committee. All financial Bills, such
as the Finance Bill, go to a committee of the who
House of Commons. After the committee sta
comes the report stage when the House conside
the Bill as reported to it by the committee a
decides whether further changes should be mad
The final stage is the Third Reading when t
House considers the Bill as a whole and wheth
it should or should not become law. If passed,
is sent to the Lords, where it enters on the sa
course. When Bills have passed through th
various parliamentary stages they are sent to t
Sovereign for Royal Assent.

The Lords cannot require the Commons
agree to amendments; nor can they delay a B
indefinitely. They have no power in respect
Money Bills; and since the passing of the Parli
ment Act 1949 any other Public Bill which h
been passed by the Commons in two successi
sessions may be presented for Royal Assent wit
out the consent of the Lords provided that a ye
has elapsed between the date of the Seco
Reading of the Bill in the Commons and the da
on which it is finally passed in that House.

Bills may originate in either House, unless th
deal with finance or representation when they a
always introduced in the Commons. The pr
cedure is basically the same. *See also* **C27.**

Money Functions of the Commons.—The seco
function of the Commons (and one of its earlie
in history) is to provide the State with mone
The Government cannot raise money by taxati
(or in any other way) or spend money without t
authority of Parliament; and this power of auth
rity belongs exclusively to the Commons. T
House can vote money only on the demand and
the responsibility of a minister of the Crown.

Critical Functions of the Commons.—Parliame
itself does not govern. The Queen's ministers a
responsible for government and parliamenta
government means that Parliament ensures th
those ministers represent and have the confiden
of the party which possesses a majority in t
House; and further, that it controls the acti
of ministers by questions and criticisms. A
member may propose a motion of condemnati
of any member or department of the Governme
and such a motion would become a vote of wa
of confidence if it were made by the Leader of t
Opposition.

The House of Lords is the oldest second cham
in the world and the most hereditary in
character. The House of Lords has two sets
functions, legislative and judicial. It is a party
legislation within the limits imposed by the Parl
ment Acts of 1911 and 1949. These limits
based on the fundamental principle that the fu
tion of the Lords, which is a non-representati
assembly, is not to thwart the will of the peo
but to ensure that that will is precisely and reas
ably interpreted. The Conservative Party reta
an overwhelming majority in the Lords and th
powers of delay can limit the effective term of t
life of a Labour Government. The right to ru
full term of office ought not to be the privilege
the party which commands a majority in
Lords. The judicial functions of the House
Lords sprang from the fact that it is the high
Court of Appeal for the United Kingdom.

CHANGES IN THE MACHINERY OF GOVERNMENT

he changes introduced by the Wilson Govern-
t since it came to power in 1964 have been far-
hing and are described in the following
igraphs.

he **Strengthening of the Cabinet.**—One of the
or changes made by the Labour Government
the strengthening of the position of the Prime
ister and the Cabinet by giving the Cabinet
uch stronger Secretariat. The primary object
his is to ensure that the Premier and Cabinet
briefed at every significant stage of a political
ctive. A number of other benefits flow from
earlier briefing of the Cabinet. It is easier by
means to ensure that there is co-ordination
veen departments, which does not always
rate between strong departmental chiefs.
ther, such strengthening of the Cabinet secre-
at ensures that someone is looking all the time
overnment as a whole and that the Prime
ister is as well briefed, as he should be, as any
is colleagues, when a subject comes up for
decision for which the whole Cabinet is
onsible.
advocating a better equipped Cabinet Mr.
on cited instances where, he thought, decisions
been taken, in the past, without proper con-
ration. One was the sudden decision to seek
y into the Common Market. Other examples
some of the demands on our military re-
ces. Examples of subjects which, examined
rtmentally, were not examined adequately
ne same time by the Cabinet, were given as
e price maintenance and Rachmanism.

e Cabinet: slight reduction in size.—In
ary 1967 the size of the Cabinet which had
ys been regarded as too big was reduced from
o 21; but it could still be regarded as too
, 16 to 18 being suggested as a more ideal
e. Few of the members of the Cabinet can
time to give adequate attention to the whole
he Government's business, apart from the
e Minister himself and the Lord President
perhaps a couple of others. The whole
e and complexity of the problems of Govern-
have become increasingly greater. That is
nge which needs a novel solution. But great
at change is there is a further new factor, the
to look ahead; the pattern of our life and
utions and of the world is changing so fast
we need ministers sufficiently free to visualise
things will be like one decade or two
ies ahead and the character of the problems
hich we need to prepare now. A list of
bers of Mr. Wilson's Government will be
l on C50.

anges in the Structure of Government.—Some
e changes in the departments of the civil
ce made by the Labour Government on taking
in 1964 had been fully anticipated, but some
a surprise. A change fully expected was the
intment of a Minister for Economic Affairs,
e new office was designed, it was claimed, " to
ew heart and drive into the economy." The
Ministry is responsible for framing and
vising the plan for economic development;
he general co-ordination of action to imple-
that plan; and for all the economic policy
ed to industrial expansion, allocation of physical resources and regional implications of the expansion programme. Another new ministry of great importance was that of Technology described below.

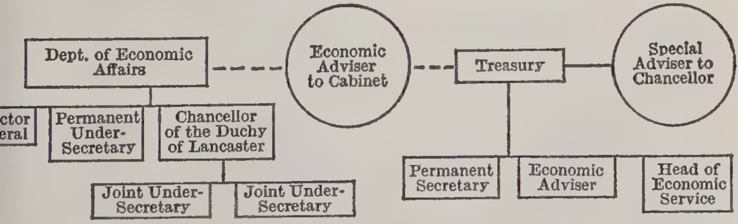
Division of Responsibility between the Department of Economic Affairs and the Treasury.—While the former is concerned with physical resources, the Chancellor of the Exchequer at the Treasury is concerned with financial questions. The Treasury retains the traditional functions of estimates, expenditure, accounting for Government expenditure, budgetary policy, taxation policy, and all aspects, including international ones, of monetary policy. The two Ministries work closely together: programmes for capital expenditure must be related to the industrial development plan. The relation of monetary policy to the rate of expansion links the two Departments. In the previous Conservative Government the Chancellor of the Exchequer presided over the National Economic Development Council; in the Labour Government the chair was taken by the Minister of Economic Affairs.

Department of Economic Affairs.—The DEA was strengthened in January 1967 by giving special responsibilities at DEA to the Chancellor of the Duchy of Lancaster, with two Joint Under-Secretaries. The Chancellor of the Duchy of Lancaster concentrates on the more detailed negotiations of wages, prices, and incomes; and the promotion of the productivity drive; one of the Joint Under-Secretaries concentrates on regional and environmental studies; the other on economic planning, the Industrial Reorganisation Corporation, and the Economic Development Councils.

The co-ordination of DEA with other Departments is shown thus:

DEA
General planning and co-ordination
of economic policy
|
Trade—Min. of—Prices and—Board—Industry
Unions Labour Incomes of Trade
Board

The Economic Advice Network between the Department of Economic Affairs and the Treasury is illustrated below. Both Departments are represented at the Steering Committee on Economic Policy (SEP) which is an inner economic Cabinet in which Mr. Brown (second man in the Government), the Board of Trade, the Minister of Labour, and the Lord President of the Council are also represented.

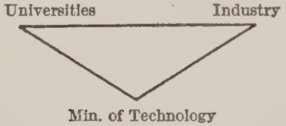


Dept. of Economic Affairs
Economic Adviser to Cabinet
Treasury
Special Adviser to Chancellor
ctor
eral
Permanent Under-Secretary
Chancellor of the Duchy of Lancaster
Joint Under-Secretary
Joint Under-Secretary
Permanent Secretary
Economic Adviser
Head of Economic Service

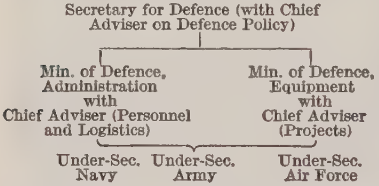
Ministry of Technology.—By the absorption of the Ministry of Aviation in 1966, the Ministry of Technology has become the biggest State-directed complex of scientific and industrial power in Europe. It was already responsible for the Atomic Energy Authority; grants to the National Research Development Corporation and fifty industrial research associations; and ten civil research establishments. The acquisition of Aviation brought in (1) the purchase of aircraft and electronics; (2) research and development contracts with industry; and (3) seven research and development establishments. To appreciate the immensity of this concentration the figures in 1967 were:

	Scientists	Cost a year i million £
Atomic Energy Authority (excl. weapons research)	2,700	50
National Research Development Corporation and industrial research associations	—	11
Civil Research Establishments	3,700	11
Aviation:		
(1) Purchase of aircraft and electronics	—	300
(2) Research and development contracts with industry	—	200
(3) Research and development establishments	3,000 scientists and engineers	50

The problems before the Minister (Mr. Anthony Wedgwood Benn) are not only technological but how to design an effectual partnership between academic science, industry, and Government. This is a totally new task. It requires the same order of boldness and skill as the Government needs in their attempt to link unions, industry, and public in the refashioning of the economy.



Defence.—The Secretary for Defence (Mr. Denis Healey) announced in January 1967 the creation of a Minister of Defence for Administration and a Minister of Defence for Equipment. The individual Service Ministers were replaced by Under-Secretaries respectively for the Royal Navy, the Army, and the R.A.F. He did not foreshadow either the abolition of the Chiefs of Staff or of the three independent Services. The pattern is:



Secretary for Defence (with Chief Adviser on Defence Policy)
Min. of Defence, Administration with Chief Adviser (Personnel and Logistics)
Min. of Defence, Equipment with Chief Adviser (Projects)
Under-Sec. Navy
Under-Sec. Army
Under-Sec. Air Force

The Department of Education and Science.—To this Department have been added Ministers of State with special responsibility for higher education and science, for schools, and for the arts. Within the scope of the Department fall the "pure science" research bodies:

- the Medical Research Council
- the Agricultural Research Council
- a new Natural Environment Research Council (for geology, hydrology, and oceanography)
- a new Science Research Council (for astronomy, space, university nuclear research, etc.).

A fundamental innovation was the creation of a Council of Scientific Policy (CSP) to advise the Minister (Mr. Anthony Crosland) on the financial priorities of science policy. It replaced the old Advisory Council on Scientific Policy; and the deletion of "Advisory" from its title denoted the basic change from an ineffective to an effective body, a change advocated by Professor P. M. S. Blackett, now President of the Royal Society.

The Ministry of Land and Natural Resources set up in 1964 was responsible for all town and country planning functions, for the Nature Conservancy, National Parks, Access to the Countryside, the Forestry Commission (shared with Secretary for Scotland), mineral rights, conservation of wat and its availability for the community's need, th geological survey, the establishment of the Lan Commission and for future policies relating to th community's land needs. Minerals under th North Sea remained the responsibility of th Ministry of Power. In 1966 the Ministry wa absorbed into the Ministry of Housing and Loca Government and its Minister became a Ministe of State there.

Planning Land.—In the first decade of the cen tury there was a Liberal election song that "Go gave the Land to the People." Over fifty yea later the Wilson Administration gave the plannin of land to a number of Departments. Decision on land purchase are made in the Department o Economic Affairs or in the physical planning div sion of the Ministry of Housing and Local Govern ment (which has now absorbed the Ministry o Land and Natural Resources) or both jointly.

Abolition of the National Assistance Board.—I 1966 the departments of the Ministry of Pension and National Insurance and the National Assist ance Board were brought together in the newl created Ministry of Social Security.

The End of the Colonial Era.—The Colonia Secretaryship vanished in January 1967 with th transfer of the Chancellor of the Duchy of Lan caster (who had also been Colonial Secretary) t the DEA and the full integration of the Colonia Office work into the Commonwealth Office. Thu the position was that the Colonial Office died o 1 August 1966, the Colonial Secretary ceased t exist in January 1967 but there were still colonie in existence with some seven million people.

Scientific Research and Development.—It wa announced in the autumn of 1966 that scientifi research and development was to be co-ordinate by a new central advisory committee on scienc and technology responsible to the Cabinet an working under Sir Solly Zuckerman.

The Reform of Parliament.—When Mr. Richar Crossman became Leader of the House in th summer of 1966 the appointment encouraged th hopes of those who wish to see the reform o Parliamentary procedures. For so far back a 1963 Mr. Crossman had written: "More time i wasted and more energy and talent frustrated i the British Parliament than in any other organisa tion of which I have any experience. Under th Attlee Government and in the first years o Opposition it was difficult to raise the faintes interest either in the National Executive a Transport House or at Westminster for reform which were dismissed as purely academic. Sinc the 1959 Election the mood has changed. . . Collectively as members of Parliament they resen both the rapid decline in its prestige and the pro cess by which it is being stripped of any real rôl in the great decisions of State." That was i 1963. In the following year Mr. Harold Wilso spoke out strongly on the need of House of Com mons reform. It was the only occasion in recen years when any leader of a political party devote ajor speech to the subject. His proposals ided:

(*a*) relaxation of the parliamentary voting system to allow more "free votes" and to eliminate the rigid doctrine of each vote involving an issue of confidence; and

(*b*) development of all-party committees on the lines of the existing Estimates Committee and Public Accounts Committee, not only to make investigations but to draft more controversial legislation.

ie whole subject was examined by the Select mittee on Procedure in the Session 1964/5. aspect in their reports which attracted most ition was how the extension of the Committee em might be used to provide greater informa- for M.P.s and improve the efficiency of ament. In the following paragraphs we ribe, first, the different kinds of Committees ie House which exist and then something of lebate in recent years about the extension of specialist Committee, leading, as we record v, to the decision in 1966 to set up one alist Committee on a Government Depart- 's work—the testing of the water by the very ious insertion of one toe.

mmittees of the House.—Before dealing with iew proposals we classify the existing Com- ee system. Committees fall into four groups: tanding Committees; (2) Select Committees; oint Committees; and (4) Private Bill Com- ees.

Standing Committee is a miniature of the e itself and the function of these Committees take over Bills for their Committee stage and to save time which would be spent on them if were taken on the floor of the House. A t Committee is a body of special powers and leges to which the House has delegated its ority in a special way, for example, the finding of facts, the examination of witnesses, the g of evidence, and the drawing up of con- ons which are reported to the House. Apart *ad hoc* Select Committees there are a number ssional Select Committees which are almost anent bodies (like the Committee of Public unts, the Estimates Committee, and the nittee of Privileges). Joint Committees con- of members of Lords and Commons. They eally a Select Committee of the Commons erating with a Select Committee of the Lords; are used to save duplication of Committee in each House, generally on uncontentious Private Bill Committees deal, as the name otes, with the Committee stage of Private

nmittees are, of course, portions of the e; but in addition to these true Committees are "Committees of the whole House." Committees consider Bills at the Committee and at them members may speak more than to the same question, a valuable concession discussing details of legislation. Com- es of the whole House also include the Com- es on Supply and the Committees of Ways leans. The former consider details of money spent on the Services, including the Civil e; and the latter to discuss ways and means sing the money to be thus spent.

Extension of the Committee System.—There widely different opinions as to how the Com- e system could be extended. But the ity view was that: (1) a new Select Com- e should be set up, as a development of the it Estimates Committee, to examine how the tments of state carry out their responsibili- nd to consider their Estimates and Reports; ie new Committee should function through ommittees specialising in the various es of governmental activity. Thus the ion was whether there should be an extension Committee system so that M.P.s not in the rnment might get greater information and l over Government Departments; or some Committee system such as prevails in some countries. At that time Mr. Michael Foot ed that the idea that a series of specialist ittees should be established to examine or help formulate the general range of administration or policy was a delusion. He thought that concentration on this issue would block or postpone a whole series of more urgent reforms, the main purpose of reform being to restore the authority of the House of Commons Chamber itself. Spontaneity and flexibility should be instituted into its proceedings, debates should be held over a much wider range and at much shorter notice "than is possible under present arthritic processes." More Committees, he thought, were likely to nurture the miserable deception that more and more issues can profitably be "taken out of politics." In reply it was urged that more members would be able to take an active part in gathering and analysing information and discussing policy in a more effective way; and that this process would enhance rather than diminish the significance of debates in the Chamber itself. In a very readable and informed book called *Parliament and Mumbo and Jumbo* (Allen & Unwin) by Emrys Hughes, who has been a member of Parliament for over twenty years, the author describes how the case for a committee system of government was put by Lloyd George to the 1931 Committee on Procedure and he doubts if it has ever been more clearly and forcibly put.

The subject was also well discussed in the Penguin Special *What's Wrong with Parliament?* by Hill and Whichelow (1964). The powerful advocacy of the idea in the past has been reinforced, they say, by the practice of the House which has moved steadily in the same direction. (But they think the comparisons with foreign legislatures have been misleading because they are inapposite.) They argue that objections based on constitutional principles have been a little hollow, considering that the House is daily using committees of the kind recommended. An important recent precedent is the Nationalised Industries Committee. This has shown that a group of private members, by thorough study and clear presentation, can do much to illuminate matters of special complexity; and closer scrutiny by the Committee has meant less party controversy. They point out that there are a number of unofficial committees set up by members of all Parties to follow particular subjects—examples being the Parliamentary and Scientific Committee, the Parliamentary Medical Committee, and the Space Research Committee. Mr. Emrys Hughes makes the point that a Royal Commission is in essence a Committee appointed by the Government to examine some particular matter that has become of national importance. The Sankey Committee which inquired into the coal industry and recommended legislation and the Royal Commission which inquired into the working of the Poor Law both paved the way for big revolutionary social changes. Mr. Hughes recalls that Mr. Foot had himself introduced a Bill to set up a Committee of Inquiry into the Suez affair and that the report of such a committee would have supplied him with a mine of information. The arguments in support of a Suez Committee included reference to the fact that there had been a Committee on the Dardanelles and also on Mesopotamia.

The Principle Conceded of Specialist Committees on Departments.—In October 1966, Mr. Crossmann, in whom great hopes had been reposed, changed his mind about offering members a free vote on changes in parliamentary procedure. But both sides of the House did agree to the appointment of two new Select Committees: one to deal with science and technology, and the other to be a specialist committee examining the affairs of a particular department at a time. The first department chosen for study was the Ministry of Agriculture, Fisheries, and Food. Thus a new chapter of great significance to public life was unobtrusively opened.

Ministers and Civil Servants.—The relationship between the political head of a Department and his senior officials is a subject hitherto insufficiently analysed. Ministers are often appointed because they have a special knowledge or interest in the office to which they go. But very often this is not so at all. It could scarcely be otherwise under our practice by which a Minister can be switched from Economic Affairs to the Foreign Office overnight or Overseas Aid to Transport. Both these are actual recent examples. They were not unusual; the practice is as old as ministerial government. The new minister, whether he knows nothing or much of his new duties, must assume instant responsibility. His advisers are steeped in the subject; they have known the subject inside out for many years and they cannot but have formed their own views. The Minister is dependent on them for the whole body of relevant facts. It is their duty to put all the facts to the Minister and for him to decide on policy. It sounds much more simple than it can possibly be. The civil servants are doubtless men of integrity and impartiality; they are devoted and loyal. But the actual situation must often be complex and subtle between a Minister who comes with a new broom of a changing policy and a group of officials who for years have been setting their compass on a different course. Every student of politics must have concluded by changes of attitude that Mr. X, so enthusiastic about a policy before his appointment, had yielded to the subtle pressure of his permanent staff; and on the other hand he can discern when a new Minister has clearly had the force of character to lead his civil servants and not be subservient to them. We have assumed in this note that Civil Servants are beyond reproach and that any difficulty between them and the Minister spring inevitably from the situation. But an increasing number of outside specialists have in recent years joined the regulars; and the irregulars can bring a fresh eye to the situation. Such a critic was Mr. Samuel Brittan, a former member of the Department of Economic Affairs who, writing in *Crossbow*, accused the Civil Service of two failings—lack of accurate information and inability to make its views known to Ministers. He backed his attack by citing the case of the July 1966 economic crisis, which, he says, had been looming on the horizon since the May budget. The fact that the Chancellor "could get away with so many complacent statements until after the crisis was already upon us, must reflect upon either the advice he received or the vigour with which it was pressed." Conventional civil servants, Mr. Brittan says, do not sufficiently push forward unpalatable points of view. The regulars, he wrote, were rapidly regaining the ground they lost in October 1964 but the "need for more irregulars to shake a few cobwebs inside the Treasury is as great as ever."

The Labour Party's Proposals for Reform of Civil Service.—These proposals were contained in a testimony given by the Party to the Fulton Committee. The testimony made proposals which would revolutionise the whole Government machine. There has been no Cabinet decision which could, of course, thereby change the recommendations into Government policy; the proposals have instead been put to the Committee which the Government set up to examine the problem of the Civil Service. But the importance of the proposals lies in the fact that they were endorsed by the National Executive Committee of the Labour Party and that the Committee contains eight Cabinet Ministers including the Prime Minister. (The principal members of the Cabinet also testified privately to the Fulton Committee.) The proposals dealt with: (1) the relations between administrators and politicians; (2) those between administrators and specialists; and (3) relations between the Civil Service and the public. On the first the complaint was made of the excessive secrecy and of the amount of information which, in some departments at least, is kept from the Minister. "An enormous amount of work goes on in a department," says the document, "which the Minister knows nothing of—some of it research work which produces important results which are never shown to the Minister . . . some of it planning work which may be deliberately concealed from him. . . . It is this secrecy which makes some Ministers tools of their departments a good deal of the time. . . . Inter-departmental committees are a particularly effective way of undermining the authority of Ministers." On the second head the document argues that the separation of administrator from the specialist is runni against the whole trend of modern managemen Most scientists produce their best work when th are still young; scientific creativity tends to d up as middle age approaches; at this stage scientific officer will probably be glad of t chance to move on to the management side of t service; and his scientific background will gi him something special to offer as an administrato This mobility should help to avoid the moribundi which sometimes afflicts research establishmen twenty years or so after their initiation. Th scientists, engineers, and other "professionals should be groomed as potential administrato from the very early days in the Service. T complaint of secrecy reappears in the passage the third aspect, the relations between the Civ Service and the public, which it is said "som times make it appear that the whole structure British Government is designed to protect t policy-making functions of Government fro public scrutiny." Further aspects of reform a dealt with in the following four paragraphs.

Decentralisation of Authority in a Departmen —The Labour Party's evidence to the Fulto Committee suggested that Britain might mov towards the practice in the United States, whereb departments are typically composed of bureau which have an identity of their own and conside able permanence in their heads and staff. Th gives to members of the staff far more scope f pursuing a particular line of policy than the rath anonymous subdivisions of British Ministrie Thus in each bureau there would be a small bod of men with equal access to the Minister instea of the concentration of power in the hands of o man, the Permanent Secretary.

Personnel Management in the Civil Service.- The Labour Party's evidence further suggeste that the personnel management function now pe formed by the Treasury should be transferred to strengthened Civil Service Commission. Tha Commission should also have the wider functio of keeping under constant review the machiner of Government and making recommendations f improvement, including the allocation of respons bilities between departments.

A Departmental Political Brains Trust.- Ministers, it was further urged, should each hav the right to appoint a small brains trust to act a an extra pair of eyes and ears in helping him de with his department.

A Graduate School of Government is furthe recommended with a two-year course on th analogy of the French Ecole Nationale d'Adminis tration. There would then be an additional yea spent partly in one of the departments and partl in a regional centre.

Parliament as a Source of New Ideas.—We hav been discussing whether facts and ideas flow in a effective stream from civil servants to Minister and whether ministerial policy is forged in the be way. But the economic crisis of 1966 illustrate that Government was unnecessarily cut off fro another channel of new ideas—Parliament itsel Professor Bernard Crick asserted that Parliame had been neglected by the Government as a devi for mobilising consent. He contrasted the wa Parliament proved capable of mobilising an planning the whole resources of economy an people to win the second world war and its com parative failure to make the hard and unpopula but rather obvious, decisions necessary to ove come the balance of payments problem. Gover ments must govern: but they will do so better Parliament can more effectively use skills an knowledge not only for the scrutiny and formatio of policies but as a vital communication syste linking Parliament to people. The view tha Parliament balances the Executive and is thus rival is inadequate. The Executive needs t ensure that Parliament is in a position to mak the powers of Government even more strong an

ctive in a commercial and industrial civilisation.
these powers become more and more depen-
t on the willing and active consent of more and
e working people. This, says Professor Crick,
ne real case for specialised committees.

he Commons "Watchdog" Arrives.—By the
liamentary Commissioner Act of 1966 a func-
ary new to the British constitution arrived—a
missioner who resembled the Ombudsman
had been the pride of Sweden for a hundred
rs. His office was designed to protect the
en from bureaucratic maladministration. The
ernment recognised that there was a deficiency
he present method of investigating by ques-
s and by letters to Ministers. The system
ed the cutting edge of an impartial and search-
investigation. The "Justice" Report
ustice" is the British section of the Inter-
onal Commission of Jurists) had suggested
the requirement that complaints should go to
Commissioner only from a member of Parlia-
t should operate for a five-year trial period;
the Government made this a permanent re-
ement. They did not wish to see this initia-
passing at some future time to the press or the
ral public. "Justice" had further suggested
a Minister should be entitled to veto an
stigation; but the Government decided that
Minister should have no such veto and that his
administrative acts could be included in the
stigation. Another change from the recom-
dations of the Report was in regard to files
minutes. "Justice" suggested access to
but not to internal minutes, but the Govern-
t decided that for a thorough investigation
nal minutes must go in (but not Cabinet
ers). Further, the new Act denies to Ministers
right to claim Crown privilege before the
ts with regard to documents before the Com-
ioner. The Commissioner could report the
t of an investigation either to the individual
ber or possibly to a Select Committee. While
new Bill was going through the Commons a
ral Peer introduced a Bill in the Lords to
lish regional Ombudsmen to deal with com-
ts relating to local authorities, local govern-
committees, and their officials; but the Bill
defeated, the Government leaving it to local
orities to work out their own remedies.

**lations between Parliamentary Commissioner
udsman) and the Commons.**—A select com-
ee was proposed to manage relations between
mbudsman and the Commons. This followed
the original decision to incorporate the office
the Parliamentary apparatus. But it under-
the absence of a direct relationship between
ommissioner and the people complaining to
and seemed to quench hopes that his brief
t be extended to local government and other
c bodies for which Ministries are not
nsible.

bunals of Inquiry: Royal Commission Report.
e Royal Commission appointed to review the
nal of Inquiry (Evidence) Act 1921 reported
66. Among its recommendations was that
er the Attorney-General nor any other lawyer
political ties should take part in investiga-
by tribunals of inquiry. It recommends
the Act should be used with the greatest
ance but it is essential to retain its excep-
inquisitorial powers where it is vital that
ruth should be established in the public
est. No Government, the Report says,
d again set up a tribunal of the type used in
rofumo case (where evidence was taken in
and Lord Denning was "detective, inquisi-
dvocate, and judge") to investigate any
r causing nation-wide public concern. A
nal's powers to insist on disclosure of sources
formation should be used only where the
es are of vital importance to the inquiry.
ally the proceedings should be conducted in
.

al Reforms.—The Criminal Justice Bill,
contained the most far-reaching reforms of the criminal justice system for nearly twenty years. It was designed to increase the efficiency and effectiveness of the police, courts, and prison service in the war against crime. Its provisions: (1) streamlined criminal court procedure, thus freeing more police resources for the primary task of crime prevention and detection; (2) improved the effectiveness of the criminal law and the courts in convicting criminals; and (3) improved the penal system to ensure greater prospects of rehabilitating prisoners, particularly by replacing the number of short-term prison sentences with increased fines. Among the main changes proposed are majority verdicts for juries; a system of certificates for shotguns; restrictions on the reporting of committal proceedings; the abolition of preventive detention and corrective training; the introduction of a parole system; and abolition of corporal punishment in prisons.

Reform of the Honours System?—Since October 1964 there has not been any recommendation for hereditary peerages or baronetcies or any other honour carrying with it hereditary characteristics. Mr. Wilson announced in 1966 a discontinuance of the practice of making recommendations concerning honours for political services. Public service would be the criterion irrespective of party. He also promised that all aspects of the honours system would be reviewed over a period of time. When the New Years Honours List appeared in 1967 *The Guardian* observed that the Prime Minister had hardly changed the honours system at all, only tinkered with it. It is not apparently thought sufficient that public service in a democracy should be its own reward. We are perpetuating, the paper said, the sort of world that Gilbert and Sullivan used to laugh at.

The Principal Legislation of the Labour Government.—The following are the principal enactments of public interest of the Labour Governments since 1964.

National Insurance etc. Act, 1964.—Amended the provisions as to contributions and benefits under the National Insurance Acts 1946 to 1964 and the National Insurance (Industrial Injuries) Acts 1946 to 1964; abolished the earnings rule for widowed mother's allowance and widow's pension; improved the allowances payable out of the Industrial Injuries Fund in respect of incapacities arising from pre-1948 employment; and removed anomalies preparatory to the consolidation of above-mentioned Acts and the Family Allowances Acts 1945 to 1964.

Protection from Eviction Act, 1964.—Restricted eviction from dwellings and postposed decontrol of formerly requisitioned dwellings.

Administration of Justice Act, 1965.—Dealt with investment funds to be held by certain courts; and the method of dealing with funds in the Supreme Court of Judicature, county courts, and other courts.

Remuneration of Teachers Act, 1965.—Made new provisions for determining the remuneration of teachers.

Science and Technology Act, 1965.—Made further provision for scientific research under responsibility of the Minister of Technology and certain chartered bodies.

Ministerial Salaries and Members' Pension Act, 1965.—Prescribed new rates of salary for Ministers, Leader of the Opposition, the Speaker, and others.

Dangerous Drugs Act, 1965.—Consolidated the Dangerous Drugs Acts 1951 and 1964.

Teaching Council (Scotland) Act, 1965.—Provided for establishment in Scotland of a Teaching Council.

Law Commissions Act, 1965.—Provided for the constitution of Commissions for the reform of the law.

Finance Act, 1965.—Embodied in law the Budget proposals, including those on capital gains and taxation of companies and of company distributions.

Solicitors Act, 1965.—Extended powers of the Law Society in relation to property in control or possession of certain solicitors and other persons including the distribution of clients' money; conferred powers on the Law Society about education and training of persons seeking admission as solicitors; and other related matters.

Control of Office and Industrial Development Act, 1965.—Imposed further restrictions on development of land for office premises (with retrospective effect in respect of land in the metropolitan region).

Firearms Act, 1965.—Amended the law relating to firearms, imitation firearms, and ammunition.

Highlands and Islands Development (Scotland) Act, 1965.—Made further provision for the economic and social development of the Highlands and Islands of Scotland.

Trade Disputes Act, 1965.—Prevented actions founded on tort, or of reparation, being brought in respect of certain acts done in contemplation or furtherance of trade disputes.

Monopolies and Mergers Act, 1965.—Made further provision for the constitution and proceedings of the Monopolies Commission; for the matters dealt with by the Monopolies and Restrictive Practices (Inquiry and Control) Act 1948; and to prevent or remedy mischiefs that may result from mergers of businesses or similar transactions.

National Insurance Act, 1965.—Consolidated the National Insurance Acts, 1946 to 1964.

National Insurance (Industrial Injuries) Act, 1965.—Consolidated the National Insurance (Industrial Injuries) Acts 1946 to 1964.

Family Allowances Acts, 1965.—Consolidated Family Allowances Act 1945 to 1964.

National Health Service Contributions Acts, 1965.—Consolidated the National Health Contributions Acts 1957 and 1961.

Compulsory Purchase Act, 1965.—Consolidated Acts relating to acquisition of land.

New Towns Act, 1965.—Consolidated certain enactments relating to new towns.

Redundancy Payments Act, 1965.—Provided for the making by employers of payments to employees for redundancy; and established a Redundancy Fund.

Commons Registration Act, 1965.—For registration of common land and of town and village greens; and amended law on rights of common.

Murder (Abolition of Death Penalty) Act, 1965.—Abolished capital punishment of persons convicted of murder and provided for punishment of persons so convicted.

Race Relations Act, 1965.—Prohibited discrimination on racial grounds in places of public resort; prevented the enforcement or imposition on racial grounds of restrictions on the transfer of tenancies; and penalised incitement to racial hatred. The Act constituted a Race Relations Board with local conciliation committees.

Rent Act, 1965.—Restored the right to retain possession of certain dwellings; made further provision on security of tenure, rents, and premiums; and restricted evictions without due process of law.

National Insurance Act, 1966.—Provided for the payment of earnings-related benefit by way of increases of unemployment benefits, sickness benefit, and widow's allowance.

National Health Service Act, 1966.—Facilitate the financing of premises and equipment used b practioners providing general medical service and established for that purpose a General Practic Finance Corporation.

Rating Act, 1966.—Provided for the payment b instalments of rates on dwellings and for th granting of rebates.

Commonwealth Secretariat Act, 1966.—Provide for a Commonwealth Secretariat.

Finance Act, 1966.—Embodied in law th Budget proposals, including export rebate duties on betting and gaming, rate of Corporatio Tax for 1964 and 1965, and the Selective Employment Tax.

Ministry of Social Security Act, 1966.—Provide for appointment of a Minister of Social Securit and the transfer to him of the functions of th Minister of Pensions and National Insurance an of certain functions of the National Assistanc Board.

Building Control Act, 1966.—Regulated buildin and constructional work.

Docks and Harbours Act, 1966.—Regulated employment of dock workers, including provision f compensation and welfare amenities in ports, f financial assistance in construction and improv ment of harbours, and for research and training

Prices and Incomes Act, 1966.—Established National Board for Prices and Incomes an authorised the bringing into force of provisio requiring notice of price increases, pay increase and other matters, and for enforcing a temporar standstill in prices or charges or terms and co ditions of employment; dealt with the recommendation made by the said Board to amend th Restrictive Trade Practices Act 1956; and pr vided for a period lasting not more than twelv months, for restricting price increases and pa increases and for other matters connected wit prices and incomes.

Industrial Development Act, 1966.—Provided f grants towards expenditure on provision of ne business assets.

West Indies Act, 1967.—Conferred new statu of association with U.K. on certain West India territories. *See* K189.

The Land Commission Act, 1967 created th Land Commission which from 6 April 1967 ha the power to acquire, manage, and dispose of lan and to impose " a betterment levy " in respect all land transactions. Its purpose is to ensu that the right land is available at the right tim for the implementation of national, regional, an local plans; and that a substantial part of th development value created by the communit returns to the community. Its purpose furthe is to reduce the cost of land needed for essenti purposes. The Land Commission is enabled t buy land compulsorily when it is suitable f development, although it may not be needed the moment for development. Thus the A creates a land bank; and by halting speculation land likely to be needed for building it attemp to reduce the cost of land for housing. No scale of development levy are established in the Act b the Minister quoted during the passage of the B a figure of 40 per cent rising to 45 or 50 per ce of the development value itself.

Proposed Legislation in 1967 included the Ste Industry Nationalisation Bill, the Parliamentar Commissioner Bill (Ombudsman), the Fugitiv Offenders Bill, the Dangerous Drugs Bill, and a B for Slum Clearance.

GOVERNMENT and INDUSTRY.

Economic Planning.—The National Plan, th incomes policy, and the strengthened pound we the three lines of advance in the Labour Gover ment's attempt to put Britain in a position to ea its living and pay its debts. The National Pla

out to expand output, exports, and earnings
the five years to 1970. Its success depended
n the Government's ability to create a national
e of purpose and it was hoped that this would
lone through two channels—first by factory
luction committees and also by the work and
ocacy of the Regional Councils.

anges in NEDC.—Mr. Michael Stewart who
me Minister of Economic Affairs in 1966 and,
ich, the Chairman of the National Economic
elopment Council established a new concept
that body. He changed it to a policy-
encing body instead of simply a consultative
dvisory organisation. This gave some en-
agement to the Confederation of British
istry which had been critical of the Council's
Mr. Stewart envisaged that taxation policy
hin the limits imposed by Budget secrecy)
ld come within NEDC's field of operations.
C would also review the National Plan,
ked sideways by the July 1966 emergency
sures, with the hope of a revised version of
Plan making its début in 1968.

e National Board for Prices and Incomes had
set up by agreement between the Govern-
t, Management, and Unions in April 1965 and
n the task of investigating and reporting on
icular issues under the policy for Productivity,
es, and Incomes. By the time the prices and
nes standstill was introduced on 20 July 1966
Board had published eighteen reports; the
ernment then asked it to complement these
a General Report to cover the whole period.
is Report (Command Paper 3087, 1966) the
d drew lessons of wider significance from its
rience of particular problems in individual
stries. Thus the Board argued that the pro-
on of a faster rate of growth—which is the
factor—required complementary action by
gement, Unions, and Government. The
rt dealt with the economic background to the
s and Incomes Policy; elaborated suggestions
aising productivity; sought to link pay in-
es with increased productivity; and aimed
strain automatic price increases. On wage
s and price increases the Board essayed to
in the influence of public opinion. Thus it
that references of significant wage claims
d be referred to the Board at an early stage,
e attitudes become fixed and a new type of
ion difficult to provide, and while it is still
ble for public opinion, with the help of an
tive statement of the problems, to influence
onduct of the parties. Similarly with price
ses, where the Board was concerned with
roblem of what share of the growing product
industry should appropriately go to its
yees and what share to its consumers (*i.e.*,
iblic again). The Board were led on to sug-
he need to clarify the rôle and duties of
ation and other wage-determining bodies
have hitherto been under strong com-
n to pay primary regard to the interests of
contestants and therefore to ignore the
ations of the settlement for others. In all
the Government were seeking on behalf of
ation to promote a policy whereby wages,
es, and prices were not determined by power

er the Severe Restraint.—A White Paper was
n the summer of 1967 (after consideration
he T.U.C. and C.B.I.) on the prices and
es policy to be followed after the period of
restraint and the lapsing on 11 August 1967
Government's temporary powers under
V of the Prices and Incomes Act. The
nment have powers in reserve under Part II
ich they can provide for a further statutory
till of up to four months while the prices
ncomes board investigates wage or price
nents.

will the Little Neddies Grow?—It was
hat under the National Plan it was intended
ke the Economic Development Committees
Little Neddies"—a prime factor in the national economic life and administration, covering as they would most of our national industry and commerce. They are to keep the Plan under review, initiate efficiency, educate management, plan training and retraining of workers, and be concerned with investment programmes, incentives, increase of exports, and many other things. Three elements were held to give them a sporting chance of growing into sturdy Neddies: the independence of their chairmen, that they were born by agreement and not by imposition, and that the unions were involved with them. Thus we have triangular bodies (Government, employers, and unions) not just subsidiary to Government but acting as effective interlocking units of the interests involved. It was hoped that there would be two further liaisons: one, with consumers' representatives and, two, an extension of the Neddy to inform and inspire the wider circle of employers and work-people in the industry concerned and on whom in the last resort the future depends.

A New Constitutional Position.—We have said that Neddies are not just subsidiary Governmental agencies but are intended to be dynamic bodies in which the constituent elements of our economic life work together. This brings us to a fundamental change in our political life which has been insufficiently noticed. It is that the relation between Government and industry has entered a new and more permanently intimate phase. Step by step the need to manage the economy has meant advice, persuasion, and regulation by Government. With the institution of the National Economic Development Council, the spawning of little Neddies and their increasing importance in articulating the National Plan we have bodies where policy will be settled. Lord Bridges had said in 1963 that if the NEDC settled policy effectively "it would take a lot of power from Parliament." We thus meet a new constitutional situation.

The Marriage of Capitalism and Planning is thus leading to new political institutions and mechanisms in Britain as in other countries; to a new balance between public and private power; and to a possible devitalisation of Parliament. This new problem, which springs from the growth during the last fifteen years of a new form of modern capitalism, is studied in a book, *Modern Capitalism: the changing balance of public and private power* by Andrew Shonfield, published by Oxford University Press. In this the institutions of the new system are examined country by country. He sees France as the classic case where principles and practice have been worked out with precision. The French system is paternalistic: the premise is that bureaucrats there are so skilled that they can impose their wills upon industrialists and labour leaders. Superior knowledge, persuasion, and inducements are, it is said, driving the industrial machine ahead. (Whatever handicaps in the political field de Gaulle inherited from the Fourth Republic he had the benefit, at any rate, of the great improvement which had already been effected by the civil service in the industrial regeneration of France.) In Germany, a similar effect is obtained in a different way. Government appears to remain passive and to regard free enterprise as sacred but bureaucratic direction is given from a non-government quarter, the banks. Mr. Shonfield turning to Britain examines the dangers of the extra purposiveness of a professional bureaucracy seeking to create and sustain extra economic growth. He examines ways of easing the impact on the citizen—by changes in law and other forms of protection.

New Forms of Government Enterprise.—A revolutionary new Government agency (the Industrial Reorganisation Corporation) to act as a holding company for new forms of Government commercial and industrial enterprise was announced in 1966. Armed with massive sums of capital it will have almost unlimited powers to buy up privately-owned enterprises, found new ones, and create the circumstances for big mergers between existing industrial institutions. This forms a dramatic new method of taking over—short of public ownership—firms which are falling down on their task, coupled with plans for new incentives to industry and special incentives to regions. The Government will thus be able to step into a lagging section of the economy. As a trial run for this new plan the Government set up a Government-cum-private agency for the Fairfield ship-yard. This new strategy was described as tycoonery for the benefit of the nation instead of private profit. All this will require high economic intelligence and superlative direction.

Industrial Relations: a change in direction.—A Conference on Productivity was held by the Prime Minister in September 1966. Separation of the collective bargaining function from that of joint consultation has caused, over the years, confusion in the two sides of industry. Negotiations between the two sides have operated for fifty years on the voluntary principle. Apart from the nationalised industries only a small proportion of industries have works councils covering safety, welfare, and feeding arrangements. Another Conference was held in the spring of 1967.

Retraining.—Industrial retraining was launched on an extended basis at the end of 1966 by a number of measures, including a Government contribution of up to £2 million in 1967 to help employers to provide additional places in their own training centres for retraining adults for semi-skilled jobs. By the end of 1968 it was planned to raise the number of places in Government training centres from 6,400 to nearly 10,000. Government centres will then be capable of training or retraining 20,000 workers a year. Among the Government's measures were a move for new Government centres by the end of 1967 making ten centres in all; more intensive use of space in Government centres; and apprenticeship training classes in technical colleges. The new factor in the retraining campaign was the recognition that training facilities can be expanded quickly only by making use of the resources available within industry and the training establishments of the armed services. These arrangements were aimed mainly at training semi-skilled workers but the main shortages were among more advanced skills.

A Proposed Tribunal on Trade Union Disputes.—A tribunal to settle procedural questions and disputes about trade union recognition was proposed to the Royal Commission on trade unions and employers' associations by Mr. Allan Flanders, Oxford University lecturer in industrial relations and member of the Prices and Incomes Board. Recognition disputes tend to be settled by strikes—the only way a union can make an unwilling employer bargain collectively. This is not only costly to the community: it is also unfair to workers who lack industrial strength or who are reluctant to use it. His tribunal would hear procedural disputes (such as discrimination by employers against union representatives, or arguments about closed shops) and could also deal with jurisdictional disputes. The tribunal, thought Mr. Flanders, should have no powers of enforcement (which could only be fines), at least until experience of its working had been gained.

REGIONAL PLANNING AND ORGANISATION.

Regional Economic Planning was introduced by the Labour Government in 1964. There are eight economic planning regions in England, while Wales, Scotland, and Northern Ireland each have economic planning machinery. The eight English regions are the Northern, Yorkshire, and Humberside, the East Midlands, East Anglia, the South East, the South West, the West Midlands, and the North West. In each English region and in Scotland and Wales there are two bodies, an Economic Planning Council and an Economic Planning Board. The Northern Ireland Government set up an Economic Council in December 1964 and there is continuing liaison with the U.K. Government.

The Planning Councils are advisory bodies
members, appointed as individuals with a wid
range of knowledge and experience of their region
They are not appointed as delegates or repr
sentatives of particular interests. The membe
ship is drawn from local government, industr
and commerce, the trade unions and other sphere
of activity in the regions with a contribution
make to regional planning. The Councils assist
the development of planning in their regions in th
context of the National Plan, and with a view
making the best use of the regions' resources an
also to advise on the implementation of region
policy. In addition they advise the Centr
Government on the regional implications
national economic policies. The Councils have n
executive powers.

The Planning Boards.—Each regional Plannin
Board consists of senior civil servants from th
main Government departments concerned wit
regional planning. In the English region th
Chairmen are all senior officials of DEA. Th
functions of the Board are in co-operation wit
the Planning Councils to help formulate region
plans and to co-ordinate the work in the region
of the Government departments concerned wit
regional planning. The creation of the Boar
does not affect the existing powers and respons
bilities of Local Authorities or existing Ministeri
responsibilities.

Regional Centres.—Efficient co-ordination
aided by housing the regional planning staff
most of the main Government departments in th
same offices. At each regional office is a join
Secretariat serving both Planning Council an
Board. The English regional offices are at:

Newcastle Bristol
Leeds Birmingham
Nottingham Manchester
London (serving both S.E. and East Anglia)

The Welsh and Scottish offices are at Cardiff an
Edinburgh.

**Consultation with Local Authorities and Othe
Bodies.**—In the preparation of draft studies fo
their regions, the Planning Councils and Board
consult as necessary with local authorities, indus
trial, commercial, and other interests.

Regional Research.—As a first step toward
improving the range and availability of region
statistics, the Central Statistical Office prepare
the first Abstract of Regional Studies (Septembe
1965). To increase research on regional studie
the National Institute of Economic and Soci
Research was commissioned in 1965 to carry ou
a major three-year research project on region
economic analysis.

The Imbalance Between Regions.—The need f
regional economic policies spring from two mai
reasons: (1) to speed up economic developme
in those regions which have lagged behind th
most prosperous regions, and thus to make fu
use of their labour and other resources; and (2) t
help tackle the problems of places where th
pressure on resources and services is high. (
major factor to take account of in national an
regional planning is the expected substanti
increase in population.) Balanced developme
will help the nation achieve not only a greater bu
allow a steadier rate of economic expansion tha
in the past. The Department of Economic Affai
is responsible for co-ordinating work on region
planning as well as for preparing the Nation
Plan.

**Development Districts and Development Area
—**In addition the Government has taken othe
important measures aimed to secure balance
development. In the areas where more jobs a
needed these measures are the building of mo
factories in certain areas defined as the Develo
ment Districts; exemption of the Developme
Districts from most of the Government's financi

aints; the granting more readily of per-
ion to build factories or large extensions.
e have also been defined new, wide Develop-
t Areas where grants for the purchase of new
t and machinery are paid at double the
onal rate and where there are other forms of
ernment assistance (at present available only
narrower Development Districts).. Within
hly 40 miles of the centre of London and in
built-up area in and around Birmingham, a
t limit on the development of offices has been
duced.

LOCAL GOVERNMENT

cal Government is concerned with the
estic duties of a community as distinct from
nal questions like defence or taxes which
be decided by Central Government. Eng-
and Wales (exclusive of London) are divided
Administrative Counties, County Boroughs,
ghs, Urban Districts, Rural Districts, and
hes. The structure, as the chart shows, is
vertically: on the one side stand the county
ghs (all local government therein being in
ands of one authority—the county borough
il); and on the other the organisation govern-
e administrative county (where there is a
on of function). In Scotland there are
y Councils, Burgh Councils, and District
ils; and in Northern Ireland there are
y Councils, County Borough Councils, and
gh, Urban, and Rural District Councils.

don Government.—The London Government
963, involved the abolition of the London
y Council and the Middlesex County Council,
arts of Essex, Surrey, Kent, and Hertford-
have been incorporated in Greater London,
now covers the whole of the continuously
ped area within the green belt. The system
fully into effect on 1 April 1965.

London Boroughs.—There are 32 London
ghs and the population of each is between
0 and 340,000. Broadly speaking the new
ghs are responsible for all the important
al services such as housing, health, and
e. Each council has a maximum of 60
y elected councillors, plus aldermen up to
th, making a maximum of 70. The coun-
retire together every three years. The
ndent position of the City of London re-
unchanged and it has the powers of a
h.

Greater London Council, a directly elected
carries out functions which need to be
d and administered over Greater London
hole and consists of 100 councillors and 16
en. The new Councils in Greater London
nto existence as local authorities when they
lected—the GLC on 9 April 1964, and the
Borough Councils on 7 May 1964—and
hen until 1 April 1965 the new authorities
e old continued side by side. On 1 April
e new councils took over their full functions
e older authorities ceased to exist.

Elections for the Greater London Council.—For the first election of the Council, held on 9 April 1964, each of the 32 London Boroughs was also the electoral area and returned two, three, or four councillors, according to the size of the electorate in each area. These electoral arrangements may, however, be changed for future elections and it is possible that the number of electoral areas will be increased and will probably return one councillor only. Elections will be held every third year on a day which is fixed by the Home Secretary.

The Powers of Boroughs.—Each borough is a housing authority although the Greater London Authority is the "overspill" authority. Local development plans are drawn up by the boroughs (within the framework of the overall development plan of the GLC) and the boroughs are responsible for dealing with applications for planning permission. They are wholly responsible for a wide range of personal health services and welfare services for the elderly, the sick and the handicapped, and children's services. The GLC will complete the LCC housing programme and, for the time being, inherits the LCC stock of houses (about 230,000) and will eventually transfer them to the boroughs.

Education in Greater London.—In Inner London, virtually the ex-LCC area, education is the responsibility of a special committee of the Greater London Council, consisting of members of the GLC elected from the central area together with a representative of each London Borough Council, and of the City of London. The ILEA maintains the education service and decides the amount of money needed to be raised by precepts on Inner London Borough Councils and by borrowing. The education committee established by the ILEA consists of the members of the Authority together with 16 other persons chosen from people experienced in education. The unique arrangements for Education in Inner London preserve the continuity of the service which has developed since 1870 as a unity without regard to local boundary divisions. In the Outer London Area education is the responsibility of the borough council. The Act required that a report reviewing these special arrangements for education in Inner London should be presented to Parliament by 1970, but on 18 November 1965 the Government announced its intention of introducing legislation making the arrangements permanent and dispensing with this requirement.

Highways and Traffic.—The GLC is the traffic authority for the whole of Greater London. Thus "metropolitan roads" come under the GLC and the new boroughs take the remaining roads except trunk roads which the Ministry of Transport continues to look after.

Other Functions.—The GLC is responsible for fire and ambulance services, for refuse disposal and main sewerage. It is responsible initially for

LCC Parks and open spaces and places like the Royal Festival Hall, the Crystal Palace, the LCC museums, and Kenwood House. An intelligence department is being set up for the GLC charged with the duty of study and research into the many problems of Greater London.

The Local Government Act 1958 included the following provisions in regard to local government in England and Wales:—

1. Replacement by a general grant of a number of separate grants made for specific services. The largest to be absorbed are those for education, health, fire, and child care.
2. Rerating of industry from 25 per cent. of net annual value to 50 per cent.
3. Creation of two Commissions, one for England and one for Wales, to review the areas of counties and county boroughs, and to consider claims for extensions and also claims by large non-county boroughs or urban districts that they ought to be county boroughs. (A population of 100,000 will be regarded as establishing a presumption of adequate size.)
4. Selection of five big provincial conurbations (in England) for special review by the Commission.
5. Reviews of districts and parishes, outside these five areas, by county councils.
6. Delegation of certain health, welfare, and education functions by county councils to the larger district councils.

The Commission's Reports.—By the beginning of 1966 the Commission had issued nine final reports —West and East Midlands, the South West, Tyneside, the North East, West Yorkshire, York and North Midlands, Lincolnshire and East Anglia; and they had made draft reports on the North Western General Review area and South East Lancashire and Merseyside Special Review areas.

The End of the Local Government Commission.—It seemed in 1966 that this Commission had decided that there was little point in going on with their work in view of the radical re-thinking which was taking place.

Two New Royal Commissions.—In 1966 the Government decided to be bold and appointed two Royal Commissions to review and to revise Local Government in England and in Scotland respectively. They were expected to take two years to produce a finished plan and not just a set of principles. A third year will be needed to debate legislation so that by 1970 there should be the new structure essential for a modern Britain. The Local Government Commission described above will be disbanded. The evidence which that Commission has gathered, together with the reports of the Maud and Mallaby Committees on the management and staffing of Local Government will provide an abundance of facts. It was expected that a reformed Local Government would reduce the demand for elective Regional Government. But one supreme thing was expected: that the result would be a root-and-branch reform.

LAW AND THE COURTS.

The subject of English law and its sources (comprising Common Law, Case Law, Equity, and Statute Law) is dealt with in the Section **The Law of England.**

The System of English Courts.

I. Criminal Courts.—1. *Courts of Petty Sessions.*—At the bottom of the ladder are the Courts of Petty Sessions, which can try minor offences punishable either by fine or imprisonment, with a maximum of six months' imprisonment for one offence and twelve months for two or mor These courts are presided over by not fewer tha two local Magistrates, called Justices of the Peac whose office is honorary, and who are appoint by the Lord Chancellor on the recommendati of the Lord Lieutenant of the County. Son officials, *e.g.*, Mayors during their term of offic are J.P.s *ex officio*. Most J.P.s are laymen, b all Petty-Sessional Courts are assisted by trained magistrate's clerk, who is usually solicitor.

In many of the bigger towns a barrister know as a "Stipendiary Magistrate" is appointed act as sole and permanent magistrate, and London there are a number of such magistrat known as Metropolitan Magistrates.

These courts also act as courts of prelimina inquiry to determine whether there is a *prim* *facie* case (*i.e.* a case that requires to be answere against an accused which will require his bei "indicted" for trial by jury. This they do taking depositions from witnesses. If they d cide that there is no *prima facie* case, the accus is discharged; if that there is such a case, he committed for trial either to the Quarter Sessio or the Assizes.

2. *Quarter Sessions.*—These courts have a wi jurisdiction, but cannot try the most serio crimes, *e.g.*, murder, treason, or bigamy. Trial by jury. The courts are of two kinds. Tho which sit for the county are presided over magistrates for the county with a legally qualifi chairman; those for boroughs by experienc barristers known as "Recorders." Courts Quarter Sessions also hear appeals from Pet Sessions.

3. *Courts of Assize.*—England and Wales a divided into a number of circuits of very ancie origin, each comprising a number of Assize tow One or more judges of the High Court go on ea circuit at least three times a year. Their crimi jurisdiction is unlimited, and they also deal wi such civil cases as can be conveniently dealt wi locally rather than at the High Court of Justi in London. A great many divorce cases are th disposed of.

The Central Criminal Court, or Old Bailey, it is popularly known, is the seat of the Assi for the City and County of London and certa parts of the home counties. Because of the i mense population of this area, the Sessions are he once a month, and four courts are held at a tin

4. *The Court of Appeal* (*Criminal Division*). This court is situated in the Royal Courts Justice Building in London and usually consists two judges of the Queen's Bench and the Lo Chief Justice. Appeals from Quarter Sessio and the Assizes lie to this court, which has pow to quash, reduce, or augment sentences on appe

5. *House of Lords.*—An appeal from the Cou of Criminal Appeal lies to the House of Lor with the permission of the Court or of the Hou of Lords itself.

The constitution of the House of Lords as judicial body is discussed on another page.

II. The Civil Courts.—1. *The County Court.* There are about 500 County Courts in Engla and Wales which are grouped into circuits (n the same as the Assize Circuits). A Coun Court Judge visits each court at least once month. Broadly speaking, his function is to t civil actions when the amount involved is less th £400. The Matrimonial Causes Bill 1967 provid that County Court judges will take undefend divorces.

2. *High Court of Justice.*—The High Court Justice is one of the two branches of the Supre Court of Judicature, the other being the Cou of Appeal, described below. The High Cou deals with all civil cases, except those dealt wi by the County Courts or by the civil side of t

zes. Since 1873 it has been divided into three ions:—

(1) the Queen's Bench Division, which is principally concerned with common-law suits;
(2) the Chancery Division, concerned with equitable matters; and
(3) the Probate, Divorce, and Admiralty Division, whose title is self explanatory.

Divisional Courts of Queen's Bench and ate Divorce and Admiralty Division.—Appeals oints of law from magistrates, etc. (by "case d," heard by two or three High Court judges).

The Court of Appeal (Civil Division).—Appeal s of right from decisions of the County Court from the High Court of Justice to this court. eals are heard by courts consisting of two or High Court judges, usually including the er of the Rolls. The court can dismiss an al, allow it or make a fresh order as to ages or costs, or order a new trial.

The House of Lords.—Appeal lies from the t of Appeal to the House of Lords, with the nission of the Court or of the House of Lords. the "Law Lords" (or "Lords of Appeal in nary"), who are eminent lawyers and life s, and certain other high judicial appointees t when the House of Lords is constituted as dicial body to hear either civil or criminal eals. They are presided over by the Lord ncellor, who is the head of the English Judici- While other judges are appointed for life, ppointment is a political one, and he retains e only during the tenure of power of his party. s, of course, always an eminent lawyer.

dicial Committee of the Privy Council.—This committee of lawyers, drawn from the Privy ncillors, who hear appeals from decisions of monwealth and ecclesiastical courts.

venile Courts.—This is a special kind of istrates' Court to deal with accused persons r the age of seventeen. The Magistrates en are specially qualified for the work, and re possible a woman is appointed as one of three Magistrates who constitute the Court. Court is held in private away from the nary court room. The object of the Juvenile t is to introduce into the trial a plan to reform offender by providing for the care and pro- on which he may need, by removal from sirable surroundings, and by subsequent edu- n or training. In these objectives the Court the co-operation of social workers, including ation Officers.

obation Officers are attached to particular ts, sometimes a Magistrates' or a higher court. etimes an offender is not sentenced to punish- , but is released "on probation," that is on condition that he behaves well and follows tions given by the Court or by a probation r. Such an officer is a trained man (or an) who advises, assists, and befriends people have been committed to his care by a court of

The probation officer, by his assessment of ocial background of the offender, can advise ourt upon the wisdom of putting the offender robation. The probation officer by his under- ding can so befriend an offender as to provide is for his rehabilitation. He undertakes the er care" of those released from prison or al or approved schools, to which juveniles are

e Welfare of the Young Offender.—Radical ges in methods of preventing and treating ile delinquency were proposed in a Govern- White Paper in August 1965 called *The , the Family, and the Young Offender.* These sals emphasised the necessity of strength- social services to the family.

e Government proposed to set up an inde- nt committee to consider the changes sary to mould the local authority personal services into an effective family service. This preventive work, apart from its positive social value, would expose situations which might give rise to delinquency. A high proportion of adult criminals have been juvenile delinquents; and the prospect of successful treatment is greatest with young offenders. Therefore young offenders would, in future, be divided into two categories—those under 16 and those in 16–21 age group. Those under 16 would be removed, as far as possible, from jurisdiction of courts. Thus children would be spared the stigma of criminality; and a better means would be provided for directing social inquiries, discussing treatment with parents and social workers, persuading parents to assume more personal responsibility, and to allow more flexibility in developing treatment according to the child's response. The under-16's would be dealt with by Family Councils and Family Courts. Thus there would be no Juvenile Courts as hitherto known. At the time of going to press (April 1967), the Seebohm Committee had not then reported and Government policy had therefore yet to be formulated.

Some Views on the Proposals.—It will be seen that deterrence in the form of fear of punishment has little part in the scheme. But prevention is aimed at both by training and by investigation of causes. This investigation offers scope for research into the root causes of crime. The proposals were broadly welcomed. But the National Association of Probation Officers, in commending much of the scheme regretted the abandonment of the existing juvenile court. They did not believe that the plan met the requirement, adumbrated by Lord Devlin, that every question affecting the liberty of the individual was one for a judicial body. The Association felt that social workers who would take part in councils' decisions and, in many cases, be charged with carrying them out, would be in an "intolerable position". The Magistrates' Association in their evidence to the Royal Commission on Penal Reform had recommended that juvenile courts should be retained; the judiciary, they declared, should remain independent of the social and welfare services.

Legal Aid and Advice.—If you need help in problems, disputes, or Court cases you should know about legal aid and advice. The help of a lawyer of your own choice is within your means. You can get legal advice on questions of English law from a solicitor, whatever your means, for £1 and if your means are small such advice may be had free or for 2*s*. 6*d*. You can get legal aid, if your means are small, to make or defend a claim where there is not yet any question of taking or defending proceedings in a Court. You can also get legal aid for most Court cases in Courts of England and Wales, whatever your nationality if your means are moderate, either free or for a contribution which you can afford. There are pamphlets *How you can get legal advice* and *Legal Aid and Advice* which can be obtained from one of the Legal Aid Local Offices or Local Committees (of which there are 110) and their addresses can be ascertained from Citizens' Advice Bureaux, Court Offices, local government offices, or the telephone directory. The No. 1 (London) Legal Aid Area Office is 29–37 Red Lion Street, London, W.C.1. The principal address in Scotland is Legal Aid Central Committee, Law Society of Scotland, 34 York Place, Edinburgh 1.

THE COMMONWEALTH.

The Commonwealth is a free association of twenty-six (1967) sovereign independent States. So vast and complex an association has not been easy to define with precision. For a long time the term "British Empire" was used, and the self-governing countries (other than the United Kingdom) were called "Dominions." These terms have now given place to "Commonwealth" or "Commonwealth of Nations" and "Members of the Commonwealth." The last term describes the sovereign countries named on K189. Other parts of the Commonwealth, such as Colonies, while they may be described as "Commonwealth countries" are not *Members* of the Commonwealth.

The Nature of the Commonwealth.—The Commonwealth is not a federation, for there is no central government, defence force, or judiciary, and there are no rigid obligations or commitments between them. Nor is it a contractual association as the United Nations is. Like the United Kingdom itself the Commonwealth of Nations has no written constitution. But all its members have a broad community of interests, and they are bound together by a common sense of ideals and by a common interest in the maintenance of peace, freedom, and security. Although the Commonwealth includes about a quarter of the total population of the world about three-quarters of the Commonwealth's people live in India. The white population of the Commonwealth is only a small fraction of the whole. The diversity is further illustrated in religion, for the Commonwealth includes over 200 million Hindus, 100 million Moslems, and 80 million Christians. The same variety appears in climate and natural resources. But in spite of diversities of race, religion, language, and tradition, members share a common political heritage which has given rise to a broadly common pattern of institutions.

The Sovereign and the Commonwealth.—The Queen's legislative power in the parliaments of the Commonwealth is a formality—she reigns, though she does not rule; but she provides the element of continuity in the administration. The Queen is, therefore, Queen of the United Kingdom, Canada, Australia, New Zealand, Ceylon, Jamaica, Trinidad and Tobago, Sierra Leone, Malta, Gambia, Guyana and Barbados, all of whom owe her allegiance, and she is the symbol of their free association in the Commonwealth. Those countries which are Republics (India, Pakistan, Ghana, Cyprus, Nigeria, Tanzania, Zambia, Malawi, Botswana, Uganda, Singapore, and Kenya) with Presidents as Head of State; Malaysia, which has one of the Malay Rulers as Head of State; and Lesotho, which has its own monarch, do not owe allegiance to the Queen. All members accept her as the symbol of the free association of member nations of the Commonwealth and as such Head of the Commonwealth.

The Colonies.—As stated in the opening passage of this outline, the United Kingdom, in common with other members of the Commonwealth, has certain dependencies which are described as "The Colonies." But this is a loose term, for "the Colonies" are not really all Colonies in the strict sense. What are loosely spoken of as Colonies are properly divided into Colonies, Protectorates, Protected States, Trust Territories etc.

Definitions.—*Colony.*—A territory belonging by settlement, conquest, or annexation to the British Crown.

Protectorate.—A territory not formally annexed, but in respect of which, by treaty, grant, usage, sufferance, and other lawful means Her Majesty has power and jurisdiction.

Protected State.—A territory under a ruler which enjoys Her Majesty's protection, over whose foreign affairs she exercises control, but in respect of whose internal affairs she does not exercise jurisdiction.

Trust Territory.—A territory administered by the United Kingdom Government under the trusteeship system of the United Nations.

Condominium.—A territory over which responsibility is shared by two administering powers.

Leased Territories.—This term applies only to that part of the mainland of China which was in 1898 leased to Great Britain for ninety-nine years and is administered by the Government of Hong Kong.

Associated State.—A former colonial territo
which has entered into a free and voluntary as
ciation with Britain to become self-governing
all matters except for external affairs and defen
The term applies to six of the East Caribbe
islands—Antigua, St. Kitts–Nevis–Anguilla, a
the four Windward islands of Dominica, St. Luc
St. Vincent, and Grenada.

Responsibility of the British Government.—T
British Government is responsible for the affa
of Colonies (properly called Crown Colonies) bo
internal and external, and for their defence, a
their peoples are British subjects. Protectora
are governed in the same way as Colonies, but ha
not been annexed. The peoples of Protectora
are not British subjects but British-protect
persons. In the case of an Associated State t
British Government is responsible for defence a
external relations, though it may confer upon t
Associated State's government authority to d
with specific matters of foreign affairs.

The Countries of the Commonwealth.—At t
end of the Gazetteer is a list of all the countr
of the Commonwealth showing their land ar
and recent estimates of population. The l
distinguishes between the sovereign membe
and the British dependent territories, and classif
the latter according to the kind of dependenc
Not all the British dependencies come exact
within the definition either of Colony of Prote
torate, since, for historical reasons, many co
partly under one heading, partly under another

Rebellion in Rhodesia.—The dissolution
December 1963 of the Federation of Rhodesia a
Nyasaland led to the independence of Northe
Rhodesia (as Zambia) and of Nyasaland
Malawi) and left Southern Rhodesia, renam
Rhodesia, as a self-governing colony. Rhodesi
white, minority Government pressed for comple
independence. The Rhodesian Front, under t
Prime Ministership of both Mr. Winston Field a
Mr. Ian Smith, had insisted that Rhodesia had
immediate right to independence based on (*a*) t
fact that it has been self-governing for forty yea
and (*b*) that this was morally, if not indeed
plicitly but privately, promised by Brit
Ministers when the Rhodesian Federation w
broken up. The British Government, both un
Conservative and Labour rule, specified only th
while Rhodesia should move to independence l
any other self-governing dependency, it should
under a constitution broadly acceptable to t
people as a whole and should provide for a peace
transition to majority rule. This principle w
elaborated in a statement of five conditions set
in the following paragraph. It was not said
either party that independence could not
granted to Rhodesia until a government elect
on a franchise wide enough to be described a
government "of the majority" is actually
power. But that majority rule must be the p
condition was asserted by the two Rhodes
African leaders (divided, but both in prison),
the African States, by the United Nations, a
by some Commonwealth countries.

Five Conditions for Independence of Rhodesia
In the protracted negotiations between Mr. Sm
and Mr. Wilson to reach a settlement in 1965
latter took his stand on the following five con
tions:—

1. a guarantee of unimpeded progress
wards the majority rule already envisaged
the 1961 Constitution;

2. a guarantee of no retrogressive ame
ments of the 1961 Constitution;

3. an immediate improvement in the p
tical status of the African population;

4. progress towards the elimination
racial discrimination; and

5. the overriding requirement that Brit
must be satisfied that any proposed basis

independence would be acceptable to the
Rhodesian population as a whole.

e British Government offered to co-operate
crash programme of education for Africans to
em to take an effective share in the economic
political life of the country within the span of,
bly, a decade.

e 1961 Constitution, which has been the subject
much dispute, provided (for the first time)
n African members (in a Parliament of sixty-
elected on a virtually all-African roll. The
fifty are elected on a common roll with
ential and property qualifications, which
said to be low enough to enable enough
ans to become the voting majority in due
e. But, even if this outcome were to be
icable, this period might be as high as twenty
. The African nationalists have largely
otted registration on either roll; and the
tance of the 1961 Constitution is tantamount
e indefinite continuance of minority—i.e.,
—government.

ilateral Declaration of Independence.—The
pressure for independence from 1963 to 1965
ed its climax on 11 November 1965, when
Ian Smith declared the independence of
esia; and the British Government were con-
ed by an act of rebellion. (U.D.I. became
n as I.D.I., the illegal Declaration). The
protested their loyalty to the Sovereign,
e commands, however, they were repudiat-
African opinion was outraged, and among
countries which broke off relations with
in were two Commonwealth countries
a and Tanzania), Mauritania, Guinea, Mali,
udan, Algeria, and the Congo (Brazzaville).
in ruled out, from the start, the use of force;
r. Wilson embarked on a policy of graduated
mic sanctions, including an oil embargo;
bjective being the emergence, under economic
hip, of a liberal alternative to the Smith
e. The United Nations took the view that
961 constitution had broken down and that
ecrees signed upon I.D.I. amounted to the
uction of all safeguards for the rule of law and
uman rights in the 1961 constitution and
r legislation.

percussions of the Rebellion.—On the very
of the illegal declaration in Rhodesia the
d Nations General Assembly in a resolution
ed by 107 votes to 2 (Portugal and South
), with one abstention (France), condemned
eclaration. (France disapproved of the
ation and would not recognise the new
nment, but did not vote because, in their
it was technically an internal British matter.)
day the Security Council by ten votes to
(France again abstaining) condemned the
ation. On 20 November the Security
il (again by ten votes to none) called
the British Government "to quell this re-
n of the racist minority." There are many
s of the complex position in Rhodesia,
everal interpretations can be given. But
entral fact must be stated simply: four
n Africans remain subordinate to 220,000
. The implications of the rebellion go far
d Rhodesia. It has exacerbated the whole
m of race division in Africa. As such it has
d strong feelings in black African countries
as strained the Commonwealth (on the
racial character of which Britain has set
store). The rebellion exacerbates in par-
the threatening confrontation between
African countries and South Africa and
al.

monwealth Conference 1966 and Rhodesia.
the Conference of September 1966 it was
d to give the Rhodesian Front régime a
chance of a negotiated settlement with
. If the offer were rejected Britain under-
o sponsor jointly mandatory sanctions at
N, withdraw all previous proposals for a constitutional settlement, and not grant independence before majority rule is achieved. The final offers by Britain had to be accepted before a fixed date (which was agreed by the conference although it was not disclosed). The communiqué, the main points of which are summarised below, was unanimously adopted and the deadline agreed to—but this was not unanimous.

Main Points of Commonwealth Conference Communiqué on Rhodesia, 1966, were:

The Rhodesian regime will be told that if it is not prepared to end the rebellion, the following consequences will ensue:

> (*a*) The British Government will withdraw all previous proposals for constitutional settlement which have been made. It will not thereafter submit to Parliament any settlement which involves independence before majority rule.
>
> (*b*) Britain will join in sponsoring in the UN Security Council before the end of 1966 a resolution for effective and selective mandatory economic sanctions against Rhodesia.

The British Government will not recommend to Parliament any constitutional settlement which does not conform with the six principles. (These principles are summarised below.)

Most Heads of Governments expressed the firm opinion that force was the only sure means of bringing down the illegal régime. Others shared Britain's objections to the use of force to impose a settlement.

It was agreed unanimously that aid should be given to Zambia to produce a more complete cut-off of trade with Rhodesia.

After the illegal régime is ended, a legal Government will be appointed by the Governor. Britain will negotiate with this Administration a Constitution directed to achieving majority rule.

The settlement will be submitted for acceptance to the people of Rhodesia by appropriate democratic means.

Britain will not consent to independence before majority rule unless the people of Rhodesia as a whole are shown to be in favour of it.

The six principles referred to are the five conditions for independence set out in an earlier paragraph together with a sixth, namely: no oppression of the majority by the minority or of the minority by the majority.

Smith Régime Declared Illegal.—The High Court of Rhodesia declared in September 1966 that the Smith Government was illegal and the 1965 " independence " Constitution was not the lawful Constitution. At the same time they rejected the applications of 600 political detainees who sought their release on the grounds that the Government which detained them was illegal. The Court based this rejection on the ground that the Smith Government was the effective and *de facto* Government. To avoid a vacuum the court, it was declared, must give effect to such measures of the Government as could lawfully have been taken under the 1961 Constitution for the maintenance of law and order. Immediately after the judgment the Smith Government introduced permanent preventive detection. But the effect of the court's decision was to make laws which fall foul of the entrenched provisions of the 1961 constitution illegal and therefore challengeable in the courts. The 1965 Constitution proposed to remove the entrenched provisions regarding constitutional amendment; and the further constitutional amendments introduced by the Smith régime made further inroads into the provisions protecting the liberty of the subject and the rights of Africans to hold tribal lands.

The Ride on the " Tiger."—After secret " talks about talks " between officials during the summer of 1966 Mr. Wilson and Mr. Smith had talks on 2 December on board H.M.S. *Tiger* off Gibraltar and prepared a working document which the

Rhodesian Cabinet rejected three days later; and on the 16th the UN Security Council voted on a British resolution for mandatory sanctions, including oil. Mr. Smith said that in his view Rhodesia had become a Republic, a statement which he later modified.

Progress Towards Independence of Other Countries.—The next countries which seemed, at the opening of 1967, to be coming up for independence were Mauritius, Fiji, Swaziland, and British Honduras.

The Commonwealth Secretariat was established in 1965. This new body acts as a central source of information and preparation, independent of Britain's Commonwealth Office. Thus the Commonwealth has its own staff with no ties to any single member. There is likely to be, at least experimentally, a form of Commonwealth Assembly—an idea which originated with the British Government. It is to be hoped that meetings will not be confined to London, but that other capitals will be given an opportunity.

Arnold Smith, Canadian diplomatist, was appointed to the new post of Commonwealth Secretary General. He was a Rhodes scholar at Oxford, Canadian Ambassador in Moscow (which took him through the Cuban crisis) and a lecturer in politics and economics. The quality of paramount importance in a Secretary General of a family of 730 million is his ability to get along with people regardless of race. It was said that his indifference to the colour of skin was nothing theoretic—he just did not notice, a colour blindness of attitude. But of course his views on racial equality are strong. Just before becoming Secretary General of the Commonwealth he said: "The division of humanity between the white and other races, which coincides too closely for comfort with the division between the affluent industrialised peoples and the poor underdeveloped peoples, is, I think, the most difficult and potentially dangerous problem in the world." It was Arnold Smith who drafted at the 1964 Commonwealth Conference the Commonwealth Declaration on Racial Equality.

Britain's Special Representative in Africa.—A Special Representative dealing with Britain's relations with Kenya, Tanzania, Malawi, and Zambia was appointed in 1965. He was Mr. Malcolm MacDonald, then British High Commissioner in Kenya. He became a roving ambassador to Commonwealth countries in Eastern and Southern Africa. The British high commissioners in those countries continue their functions in the three capitals now concerned—Nairobi, Lilongwe, and Lusaka; and Mr. MacDonald's responsibilities are to co-ordinate major policy problems in which some or all of these four countries are involved. Uganda preferred not to enter the co-ordination arrangement for the present.

New Attitudes to the Commonwealth.—In the words of the Prime Ministers' Conference, which is its highest organ, the Commonwealth is a voluntary, multi-racial, association of sovereign states. In his informative study *Colonies into Commonwealth* (Blandford), Prof. W. D. McIntyre traces the change in British politics in recent years which may greatly affect the Commonwealth. During the last century the Conservatives were regarded traditionally as the imperial party; the upholders of colonial freedom were the Liberals, and later the Labour Party. It was a Labour government which gave independence to India, Pakistan, Burma, and Ceylon. In the 1960s came a transformation of attitudes. Macmillan trimmed his course to the "wind of change" and endeavoured to pull out of Africa as quickly as possible. He was to incur the severe misgivings of nearly all the Commonwealth premiers by trying to join the Common Market. Thus it was the Conservatives who were then set on joining Europe and Labour who stood for cherishing the Commonwealth, as dramatically declared by Gaitskell in his famou speech at Brighton at the Labour Party Con ference of October 1962. Another indication cam in April 1964 when the Establishment must hav been astonished to read a now famous article i *The Times* by "A Conservative," in which h said, "The Commonwealth has really become gigantic farce." Back again in power, Mr. Wilso proved a strong advocate of Commonwealt initiatives—a peace mission to Vietnam and t Rhodesia, both in 1965, although neither wa destined to take effect. Perhaps the most im portant development was the creation of th Commonwealth Secretariat in 1965. The firs Prime Ministers Conference outside Britain sinc 1932 was held at Lagos in 1966. Many othe Commonwealth projects are now being con structed. "Great Britain has lost an Empire an has not yet found a rôle," said Dean Acheson i 1962. Great Britain is finding that rôle. In th words of Arnold Smith, the Secretary-General o the Secretariat, "We must nudge mankind to wards more understanding and tolerance. W have to develop quickly the habits and insight of co-operation on a global basis. The Common wealth gives us one of the promising instrument for this purpose."

Immigration from the Commonwealth: th Government White Paper.—The Government' policy was set out in a White Paper (Comman 2730) issued in August 1965. The Paper wa published after a fact finding mission headed b Earl Mountbatten had reported, confidentially, t the Prime Minister upon return from eigh Commonwealth countries. The principal fea tures of the Government's policy were:

(1) A drastic reduction to 8,500 a year i the number of Commonwealth immigrant allowed to enter Britain (compared with th existing figure of about 20,800 a year). C the 8,500 work vouchers to be issued annuall 1,000 would be allocated to Malta under special arrangement for two years. (In 196 it was announced that the number of Ministr of Labour vouchers had in fact dropped t the proposed figure of 8,500.)

(2) New controls on entry of dependan (except wives and children).

(3) Powers to repatriate Commonwealt immigrants entering the country illegally.

(4) An obligation on immigrants to pr duce health certificates before admission an additional health checks on entry.

(5) A determined attack on housing shor age to prevent immigrant overcrowdin exploitation, and multi-occupation of dwe lings.

(6) Measures to integrate immigrants in British life to eliminate possibility of a gra of second-class citizens.

(7) Formation of a National Committee f Commonwealth Immigrants which would ta over the functions of the Advisory Coun established in 1962.

It was announced that a committee, the Wils Committee, would review the whole system discretionary control over aliens and Commo wealth citizens alike. The Committee was e pected to report in 1967 and that report wou prepare the way for permanent legislation.

Criticism of the White Paper came from t Liberals, a group of Labour M.P.s and the gro of Young Conservatives known as the Bow Grou The Bow Group in the findings of its study gro on immigration referred to the hardening public attitudes and that both parties h "conducted a Dutch auction on degrees of cont in a quest for electoral advantage." In 196 they said, 42,584 alien workers were admitted this country and, in addition, the net increase the number of Irish residents in Great Brit was an estimated 30,000. "When these t figures are compared with those for Commonwea immigrants it becomes clear that the col problem, rather than a desire to limit to

igration is behind the pressure for control. . . .
if our position is to mean anything at all,
must not accept the suggestion that we have
permanently defeated by the problems of our
multi-racial society." As regards the
ernment's complaint of evasion by immi-
ts, it was replied that it was practised mainly
Australians, Canadians, and New Zealanders.
critics further complained of the proposal to
the Home Secretary power to deport any
monwealth immigrant who has been in the
ntry for less than six months "if he considers
public interest to require it."

he Race Relations Act, 1965 introduced a
em of local conciliatory committees which
ires into complaints of racial discrimination
tries to settle difficulties without recourse to
rt procedures. A PEP Report (April 1967)
ealed substantial discrimination in employ-
t, housing, and the provision of credit facilities
a second and more effective Race Relations
is to be expected.

embers of the Commonwealth in Britain.—The
l number of members of the Commonwealth
ritain at the present date is about one million.
hese half are from the West Indies and 300,000
India and Pakistan. There had been settle-
ts in seaports for several generations; but an
x occurred in the second world war to supply
nd staff for the Forces. Many of these stayed
nd further numbers were recruited in sub-
ent years for special jobs, thus providing
able streams of labour when labour was short.
igrants have therefore settled in industrial
s, where pressures on housing and social
ices are heaviest. (The Holland Milner
ort stressed that there was a housing problem
re immigrants arrived.) Differences of
uage, cultures, and colour present obstacles
ssimilation. Many of the immigrants, more-
, have come from the rural areas of their own
tries, with little education and with poor or
English; and these facts, again, by keeping
roups tightly together make assimilation even
e difficult. Although the tension appears to
e been taken out of the situation in Britain the
tical problem remains as to how to create a
iracial society. This is a responsibility not
of Government but of every element in
ety. It is said that the legislative action
plified by the Race Relations Act has not
sufficiently strong. But it is doubtful
ther public responsibility has yet risen to the
enge. With some notable exceptions, such
t Leeds, York, and Reading, there has not
great initiative at the Universities; and the
e Union movement has not yet used
nfluence and power towards solving the
lems as we must hope it will. Nor have
seas students themselves been notably con-
ous by their interest. At the time of writing
e are about sixty local conciliation committees
r the National Committee for Immigrants
ing the day-to-day difficulties. Slowly the
tance of people to become involved in pro-
s with such novel and unknown factors may
ge to positive and informed action. We shall
e future be sorry if we do not now, while
on is relaxed, take a hand in creating stable
ions. If we were to be successful, our ex-
e would have a great effect in a world where,
many areas, the conflict of race is acute and
erous. And we may thus help in easing the
er confrontation—the gravest of all—between
ave and have-not countries.

itude of Political Parties.—The attitudes of
onservative and Labour Parties to Common-
h Immigration during the years 1948–65 are
ed with copious detail in a most interesting
uin Special, by Paul Foot, *Immigration and
in British Politics*. There has not been a
straightforward or consistent attitude in
party. It would have been surprising if
had been. This reflects widespread re-
s among people to a perplexing, confusing,
changing problem. Mr. Foot divided the
Conservative Party into three theoretical groups. First, the Tory Radical, fundamentally opposed to racial discrimination. This group was distinguished for its understanding of modern economics and they realise that the economic "miracle" of post-war Germany and Japan was largely due to the enormous supply of immigrant labour. Second, there was the Traditional Right, to whom the Empire was an ideal and were sentimentally attached to colonial peoples. The third relevant grouping Mr. Foot called the Goldwater Right, and their attitude towards immigration was one of shocked horror. The Radicals drew their strength from the Universities and Technical Colleges while the Traditional Rightists were largely represented on the Front Bench. The Goldwater Right was so called because its roots were in the ranks of small business, the professions, and the lower echelons of retired colonial and civil servants. Like the Conservatives, the Labour Party can be also divided historically into three main groups—the Radicals, the Left, and the Right. The Labour Radicals, like their Tory counterpart, understood the economic case for immigration; the Left cherish sentiment about the Commonwealth; and both groups dislike racialism. The Labour Right saw large-scale immigration as a peril to the privileges of the British working class. Anti-immigrant resentment, fostered over years of cynicism and neglect, took its toll of the Labour Party. Mr. Foot advocated a new Department of Social Affairs, with a separate branch for immigration. He pleads for a national scheme to recruit teachers who speak the language of immigrants; to employ sanitary inspectors, clerks, policemen, local authority officials, who are either immigrants themselves or trained in the cultural background of the immigrants. The Home Office, he says, is obsessed by control and not geared to constructive activity; and none of the other Ministries can deal with all the problems arising from immigration.

THE UNITED NATIONS.

Charter of the United Nations.—The Charter of the United Nations was signed on June 26, 1945. The purposes of the United Nations can be divided into four groups (security, justice, welfare, and human rights) and the nations undertook to carry out four main duties (to settle disputes peacefully, to refrain from treating or using force, to assist in carrying out the Charter, and not to assist an aggressor). The UN affirms faith in the human rights of all without distinction of race, language, sex, or religion.

Membership of the United Nations.—The UN had one hundred and twenty-two member countries in 1967. They were:

Afghanistan
Albania
Algeria
Argentina
Australia
Austria
Barbados
Belgium
Bolivia
Botswana
Brazil
Bulgaria
Burma
Burundi
Byelorussian S.S.R.
Cambodia
Cameroun
Canada
Central African Republic
Ceylon
Chad
Chile
China (Taiwan)
Colombia
Congo (cap. Brazzaville)
Congo (cap. Kinshasa)
Costa Rica
Cuba
Cyprus
Czechoslovakia
Dahomey
Denmark
Dominican Republic
Ecuador
El Salvador
Ethiopia
Finland
France
Gabon
Gambia
Ghana
Greece
Guatemala
Guinea
Guyana
Haiti
Honduras
Hungary
Iceland
India
Indonesia
Iran
Iraq
Ireland
Israel
Italy

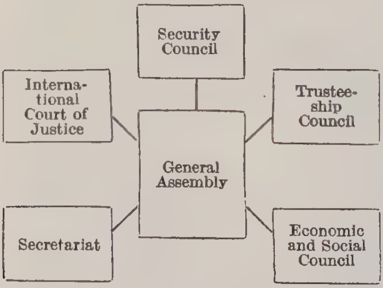
Ivory Coast
Jamaica
Japan
Jordan
Kenya
Kuwait
Laos
Lebanon
Lesotho
Liberia
Libya
Luxembourg
Malagasy Republic
Malta
Malawi
Malaysia
Maldive Islands
Mali
Mauritania
Mexico
Mongolia
Morocco
Nepal
Netherlands
New Zealand
Nicaragua
Niger
Nigeria
Norway
Pakistan
Panama
Paraguay
Peru
Philippines
Poland
Portugal
Roumania
Rwanda
Saudi Arabia
Senegal
Sierra Leone
Singapore
Somalia
South Africa
Spain
Sudan
Sweden
Syria
Tanzania
Thailand
Togo
Trinidad and Tobago
Tunisia
Turkey
Uganda
Ukrainian S.S.R.
United Arab Republic
U.S.S.R.
United Kingdom
United States
Uruguay
Venezuela
Voltaic Republic
Yemen
Yugoslavia
Zambia

Botswana was formerly Bechuanaland, Lesotho was Basutoland, and Guyana was British Guiana.

The membership includes 26 members of Commonwealth countries, representing one quarter of the world's population. The African group is numerically the strongest, with a membership of 38 (excluding S. Africa). Twelve member states are communist.

Major Organs of the United Nations.—The UN have six major organs: (1) a General Assembly, (2) a Security Council, (3) an Economic and Social Council, (4) a Trusteeship Council, (5) an International Court of Justice, and (6) a Secretariat. It is especially the inclusion of the third body on this list (with all the Commissions and specialised agencies which stem from it) which makes the UN more broad and balanced than the League of Nations.

Principal Organs of the United Nations.



General Assembly.—The General Assembly occupies a central position in the structure of the UN. But its business is quite distinct from the Security Council. It meets once a year. The Assembly can consider the general principles of co-operation for peace and security and disarmament and regulation of armaments. It can discuss any question concerning peace and security brought before it. It makes recommendations, but any question upon which action is necessary must be referred to the Security Council. The carrying out of its humanitarian work is the function of the new Economic and Social Council (dealt with below) which it elects and supervises. Further, the Assembly controls the purse

The Security Council.—The aims of the UN are wide—from feeding starving peoples to encouraging self-government in backward areas—but it cannot advance towards the noble objectives set out in the Preambles unless peace is maintained. The principal organ to preserve peace and security is the Security Council. The size of the Security Council was enlarged from 11 to 15 with effect from January 1966. Five seats are permanently occupied by Great Britain, the U.S.A., the U.S.S.R., China, and France. The China which is represented in the UN and on the Security Council is not, however, the Republic of China (or Communist China). It is the régime of Chiang-kai-Shek, who occupies Formosa. The other seats are normally elected for two years by the General Assembly. The ten temporary members are: Argentine, Bulgaria, Japan, Mali, and Nigeria (the term of these five expiring at the end of 1967) and Brazil, Canada, Denmark, Ethiopia and India (expiring at the end of 1968). The Security Council sits continuously. It has two functions: (1) to promote the peaceful settlement of disputes and (2) to stop aggression. Under the Charter, parties to a dispute have already promised not to use force, to settle their quarrels peaceably and to refer their dispute to the Security Council i they really cannot reach a peaceful settlement On its side the Council can call on the parties to settle disputes peacefully, it can investigate any situation likely to cause a breach of the peace, and at any stage it can recommend a solution.

The Veto.—At this point we must deal with the veto, which applies to substantive questions. The number of affirmative votes required for adopting decisions on substantive matters is 9, including the votes of the five permanent members. In other words if any one of the permanent members says " No " to the use of force, even after a ful investigation, the Council cannot use force to settle the dispute. Thus when it comes to imposing sanctions for a breach of the peace the assent is required of the Great Powers, and one of them may of course be a party to the dispute If the Great Powers imposed sanctions on each other it would mean a major war in which the present UN would disappear. Partly in order to overcome the difficulty of the veto the Assembly set up a Committee to remain in permanent session consisting of one representative of each member. It is known as the Little Assembly, its formal title being the Interim Committee.

The Uniting for Peace Resolution, 1950.—The General Assembly had always been able to discuss matters of peace and security, although it could not make recommendations about them if they were being considered by the Security Council But in 1950, after the Korean crisis, a new decision was taken by the General Assembly whereby if there were some threat or breach of the peace on which the Security Council was in deadlock, the Assembly, on a vote of seven members o the Security Council, could consider it immediately and make a recommendation about it. This decision, to which Russia and four other countries were opposed, was called the " Uniting for Peace " resolution. By this resolution, too, the Assembly can be called together within twenty-four hours It was the standing Interim Assembly which considered the Israeli–Egyptian dispute i November 1956.

The Economic and Social Council.—The UN pledged themselves to a broad humanitarian policy of which the following are salient points to promote higher standards of living; ful employment; the conditions of economic and social progress; solutions of international economic, social, health, and other related problems educational co-operation; universal respect fo nan rights; and the fundamental freedoms for The main business of the Economic and ial Council is to carry out this broad policy. e size of the Council was increased from 18 to with effect from January 1966. To tackle se huge problems the Council established a nber of important commissions and bodies, the ncipal being the following:—

egional Economic Commissions

Economic Commission for Europe (ECE)

Economic Commission for Asia and the Far East (ECAFE)

Economic Commission for Latin America (ECLA)

Economic Commission for Africa (ECA)

unctional Commissions

Disarmament
Statistics
Population
Social
Human Rights
Status of Women
Narcotic Drugs

pecial Bodies

UN Children's Fund (UNICEF)

Commissioner for Refugees

Conference on Trade and Development (UNCTAD)

Industrial Development Organisation (UNIDO)

ntergovernment Agencies (previously called cialised Agencies).—The agencies are organisas established by intergovernmental agreements, their activities as a rule are co-ordinated by Economic and Social Council. The list of the teen Agencies are given below.

International Atomic Energy Agency (IAEA)

International Labour Organisation (ILO)

Food and Agriculture Organisation (FAO)

UN Educational, Scientific and Cultural Organisation (UNESCO)

World Health Organisation (WHO)

World Bank (Bank)

International Finance Corporation (IFC)

International Monetary Fund (IMF)

International Civil Aviation Organisation (ICAO)

Universal Postal Union (UPU)

International Telecommunication Union (ITU)

World Meteorological Organisation (WMO)

Inter-Governmental Maritime Consultative Committee (IMCO)

General Agreement on Tariffs and Trade (GATT)

veral of these organisations were at work re the UN was set up. One such body is the

Peace Force.—In the twenty-two years since nception the UN has been called on only four s for military action—in Korea (1950), in pt (1956), in the Congo (1960) and in Cyprus 4). Korea was really an American "containment" action under the covering of the UN. he other operations, the number of troops ed from 6,000 to 20,000. Apart from military n, the UN has sent observers or "presences" rious parts of the world, mainly to the Middle Far East, to facilitate settlement of disputes. to maintain a standby force of 20,000 men, it might be needed so rarely, would be a e, apart from problems of bases, control, and equipment. Two ideas about the best kind of peace force hold the field. They are:—

(1) the earmarking of national military units; and
(2) a permanent multiracial force.

The first is a pragmatic method and the second an idealistic concept.

The Dispute over Dues.—Under Article 19 of the Charter the voting rights of any nation more than two years in arrears with its dues can be challenged. When the 19th General Assembly of the United Nations opened on 1 December 1964—and the meeting had been postponed in the hope that the quarrel over dues would be reached in the interval—Russia was two years in debt, not over its general dues, but because of its refusal to pay anything towards the special fund for UN military operations in the Congo and Middle East. France was in a similar position on 1 January 1965. There was, of course, a special political background to the dispute. By the Charter the Security Council is the executive body and it is in that Council that the Great Powers, including Russia, can exercise a veto. But in 1950, at a time when Russia was boycotting the Council, the United Nations were able to take action in Korea; and then, realising that a veto in the council could prevent future peacekeeping operations, the Assembly took upon itself special powers to act where the council had failed. The Russians asserted that this was illegal and refused to contribute to the special fund for the UN forces at Gaza (put there after Suez) or in the Congo (now withdrawn).

The essence of the dispute was not a financial one but a constitutional political one. It involved the whole function and power of the Security Council and the General Assembly and the relative functions of the two. The Russians maintained that all peacekeeping should be controlled by the Security Council where the veto existed. But the rest of the membership of the UN maintained that the General Assembly had the right and duty to intervene where the Security Council had failed to act, whether owing to the veto or otherwise.

A United Nations Success: Technical Assistance.—That the United Nations is something more than a place of talk is proved by a glance at the fifteen-year history of its programme of Technical Assistance. Those who like figures will enjoy being told that 32,000 expert years have been spent by 13,000 men and women of 90 different nationalities during the fifteen years of help in developing countries. So far 456 million dollars have been contributed and 150 countries and territories have benefited. Asia and the Far East have received 32·6 per cent of the projects, Europe 6·3 per cent, Latin America 24·1 per cent, the Middle East 13·6 per cent, and Africa 20·3 per cent. In the Congo technical assistance continued throughout the disturbances. The object of this aid is to help countries to develop their economic and political independence; and, since this must be a truly co-operative venture, receiving countries must not only invite the experts but actively participate in projects they undertake both with money and with local personnel—even the poorest being encouraged to make a contribution.

Simplification of Aid Programmes.—A major reform was made in 1966 by the simplification of the existing systems of capital and technical aid by the United Nations. The two main channels of aid were fused—the UN Special Fund and the UN Technical Assistance Board to become a single Council for a UN Development Programme.

Unicef.—Of all the United Nations agencies Unicef has most caught public imagination. In the early years of the war the attempt began to make amends to children whose early years had been shattered by war; and during the quarter century since Unicef has been bringing aid to millions all over Africa and Asia. Unicef does not draw directly on United Nations funds but voluntary help from Governments and individuals. There have been two developments of policy:

(1) a change in 1950 from post-war relief work to programmes of help for mothers and children in developing countries; and

(2) from 1960, an emphasis on education and vocational training rather than pure survival projects.

The Anatomy of the United Nations has undergone ironical changes since its inception. At the outset the Security Council was built as the organ through which the Great Powers would together discharge their collective responsibility as policemen. They were the superior powers. They had the authority and the means to act as the big policemen to keep others in order. But this assumed that the big five permanent members would agree and act in concert. This is just what they did not do. As a result, in 1950, by Anglo-Saxon device, the General Assembly was mobilised to ensure action when action was vetoed in the Security Council. But over the last decade the Assembly has grown both in numbers and in the independence of its views. It is not at all as interested in the conflict with Communism as those assumed who vested it with additional power: it is more interested in colonialism. So those who gave the Assembly this additional strength would like to reverse the position. But here we confront another difficulty. China, one must expect (and hope), will join the Security Council. That will make the unity in that body which is vitally necessary for peacekeeping even more difficult.

The United Nations, Comes of Age.—The United Nations met in the autumn of 1966 for its 21st General Assembly under a number of shadows. They were the Vietnam war; the isolation of China and all the tensions which resulted from it; the failure of the Great Powers to agree upon and pay for peace-keeping machinery; the inadequacy of the help to poorer countries; the threats of racialism in Africa and the frustration caused thereby; and the weakness and disunity of smaller nations. Furthermore U Thant, the Secretary-General, had said that he might only stay until the Assembly was over. On Vietnam he had set out his own three-point plan: the end of American bombing of North Vietnam; a reduction by both sides of military activity in South Vietnam; and recognition of the Vietcong as party to the negotiation. There were thus a number of challenges before the 21st Assembly:

(1) Could the UN help to bring about peace in Vietnam and play a part in a durable settlement?

(2) Would the UN admit Peking to the organisation?

(3) Could it stop the spread of the manufacture of nuclear weapons; and could it check the arms race?

(4) Could it hasten the end of apartheid in Rhodesia, in S.W. Africa and in South Africa itself?

(5) Could it help the rich Western Powers in their recurrent efforts to save themselves sinking into recessions?

(6) Could it secure that the Western Powers gave the poorer countries not only sufficient aid but gave it in such ways as to afford them some real hope?

(7) Could the United Nations agree upon such effective and reliable peacekeeping machinery as would enable a small confrontation to be stopped before it grew into a bigger and out-of-hand conflict?

The 21st Session lasted for three months, concluding in December 1966, and tackled 96 subjects. It commended the treaty on the peaceful uses of outer space; terminated the mandate exercised by South Africa in S.W. Africa; called upon States to refrain from actions which might hamper the conclusion of a treaty on the non-proliferation of nuclear weapons and called for the suspension of nuclear tests in all environments; approved two Covenants on Human Rights; arranged for the new UN Industrial Development Organisation to begin its work in 1967, its Headquarters being Vienna; established the UN Capital Development Fund to provide grants and long-term loans to developing countries; and reappointed U Thant as Secretary-General for a further term of five years.

China Again Excluded in 1966.—The Assembly again resolved that the issue of Chinese representation is "an important issue" requiring a two-thirds majority (voting on this was 66 to 48 with 7 abstentions). When it came to the straight motion the resolution to seat Peking and expe Formosa was defeated by 57 to 46 with 17 abstentions. At the same time a new proposal, primarily sponsored by Italy to establish a study committee to recommend "an equitable and practicable solution to the Chinese problem by 1967" was heavily defeated. At least three States—Chile Iceland, and Libya—swung back from abstention to the American side because they also supported the plan of a study committee and saw this as a new way forward. A great surprise was the fact that Canada left the American ranks and abstained, officially explaining its action as "the best available means" of showing discontent with the status quo. Britain, Russia, and France voted to seat Peking.

China and the African States.—Unfortunately the African states are not united on China. Some have special interests, of a commercial kind, in Formosa; some aided by the United States are swayed by their influence; some resent the interference of Peking in their affairs; some hesitate about the exclusion of Formosa; and some fear that, if China were admitted against the wish of the United States, that country might retaliate by refusing funds or even leaving altogether.

Africans at the United Nations.—For reasons given above the African and Asian states were in disarray when the 21st General Assembly opened a situation intensified by upheaval in Nigeria and the divisions among the Arab states.

WESTERN INTERNATIONAL ORGANISATIONS

1. Introduction.

This outline is an attempt to explain the various organisations through which European countries are trying to co-operate. It is hoped that the reader, with the help of the chart will find the pattern less bewildering than at first appears The destruction in Europe in the Second World War emphasised the need for greater union, both for recovery and for defence. A bewildering array of organisations has sprung up. They differ in form, in function, and in membership. Some overlap in function. Some are much less effective than others. The edifice is not, moreover, built on a single harmonious plan. Beneath the edifice are two different kinds of foundations, that is to say, two rival theories. These two theories (the federalist and the functionalist) are explained as the story unfolds. The story traces three main streams—the military, the political, and economic developments—and describes the bodies which evolved in each stream.

Historic Origin of European Unity.—Sully, the famous Minister of Henry IV, King of France outlined, in 1638, a proposal for achieving European unity and putting an end to war in Europe He called it the "Grand Design." It was revived in modern dress by Monsieur Briand, the French Prime Minister, in 1929. During the War (1943 the concept of a United Europe which should be created after victory was won was outlined by Sir Winston Churchill: and he returned to the subject in his famous speech at Zurich University in 1946.

wo Starting Points: ERP and the Brussels Treaty. here were two main sources of the present nerous European bodies. The first was the opean Recovery Programme in 1947 (ERP), the second was the Brussels Treaty of 1948.

he European Recovery Plan was popularly wn as the Marshall Plan, as it was the result he invitation made in 1947 by Mr. Marshall n U.S. Secretary of State) to the European ntries to draft a programme to put Europe on feet economically. The U.S.A. was ready to this aid if the countries concerned would e on co-operation and plan their needs. In ch 1948 the countries concerned created the anisation for European Economic Co-opera- (OEEC) to administer the programme of aid. body was replaced by the Organisation for opean Co-operation and Development in 1961.

ne Brussels Treaty, 1948, was the other main ce of the West European organisations. In ch 1948 Britain, France, and the Benelux ntries (Belgium, Holland, and Luxembourg), ed at Brussels to pursue a common policy on omic, political, and military collaboration, to promote a better understanding of the ciples which form the basis of the common isation of Western Europe. It also provided he creation of a Consultative Council. This ncil, when formed, was the Council of Europe, it is described below, together with an unt of all the organisations which stemmed the Treaty. Italy and the German Federal ublic joined the Brussels Treaty Organisation lay 1955, which then became the Western opean Union.

2. Military Organisations.

ne Brussels Treaty and the Western Union nce Organisation.—As we have seen, under the ssels Treaty, so far back as 1948, the five tern Powers concerned pledged themselves to ary collaboration; and in the same year they ed the Western Union Defence Organisation. hat time policy was being framed by a fear of vival of German aggression. But in time this was replaced by distrust of the Soviet Union. e were two developments. In the course of n years the Western Union Defence Organisa- was transformed by the inclusion of the nan Federal Republic itself and of Italy into ger body called the Western European Union. this change came about is described in the wing paragraphs, which tell the story of the ion of the new Federal Republic of Germany, proposal for a European Defence Community ch did not materialise), and the eventual gence of Western European Union (in 1955). second sequel of a military character of the sels Treaty was the creation of the North ntic Treaty Organisation (NATO). Whereas J is a regional organisation, NATO has an larger range, as its members include Canada he U.S.A. An account of NATO follows the , to which we now turn, of the emergence ne new German Republic and its eventual rporation in WEU.

vernment of Germany after the War.—As a t of Germany's unconditional surrender on 5, 1945, all power in Germany was trans- d to the Governments of the four principal s. By decisions at Potsdam in 1945 that r was exercised by the Commanders-in-Chief e U.S.A., the United Kingdom, the Soviet n, and France, each being responsible in his zone of occupation. On matters affecting nany as a whole, the four would be jointly nsible as members of the Control Council. n was divided into four sectors of occupation.

e London Conference 1947 of the four Foreign ters concerned failed to agree on a joint nan settlement. Unfortunately, the effect to set in motion political and economic opments which were speedily to make Germany the battleground of the conflict of ideas between Soviet Russia and the Western Powers. The Allied Control Council could no longer function efficiently; and by the end of 1948 four-Power rule had virtually collapsed and the partition of Germany was complete. A federal Parliament and Government were formed in Western Germany. The Soviet zone prepared a rival form of Government for East Germany.

Western Germany's New Status.—In May 1952 the German problem acquired a new complexion, when the so-called "Contractual Agreements" were signed by the three Allied Powers and Western Germany at Bonn. These Agreements did not form a Peace Treaty, but they attempted to define how W. Germany and the three Allied Governments should work together. Sovereignty was to be restored to Germany and she was to enter a military alliance with France. Indeed, a Treaty called the European Defence Treaty was drawn up between the four Powers, with Italy and the Benelux countries, which was to fit German Armed Forces into a Western European system. But this system, called the European Defence Community, never came to fruition as such, owing to the refusal of France to ratify the Treaty in 1954.

Collapse of EDC.—With the collapse of EDC there was a halt to the idea of a Political Community designed to embrace both the proposed EDC and the existing European Coal and Steel Community. It was logical that these two Communities formed by the same countries should not have separate institutions but should take their place within a single political community.

The London Nine Power Conference and the Paris Agreements, 1954.—Nine Powers met in London to devise a substitute for EDC. They were Belgium, Canada, France the German Federal Republic, Italy, Luxembourg, Netherlands, United Kingdom, and the U.S.A. The Conference considered how to assure full association of the German Federal Republic with the West and the German defence contribution. All the decisions which were reached formed part of one general settlement and these were embodied in agreements signed shortly afterwards in Paris. These decisions included the following:—

1. The occupation of W. Germany by Great Britain, the U.S.A., and France should end.
2. The German Federal Republic and Italy should join the Brussels Treaty Organisation.
3. The W. German Republic was admitted to the North Atlantic Treaty Organisation (NATO).

Western European Union.—These agreements took effect on May 5, 1955, when the occupation régime in Western Germany ended and the Republic attained full sovereignty and independence. At the same time the Republic became a member of the Western European Union (the expanded Brussels Treaty Organisation), which came into formal being on May 5, 1955, and also of NATO, to which we now turn.

The North Atlantic Treaty, 1949.—The founder members of this Pact (which widened the scope of the Brussels Treaty) were Great Britain, the U.S.A., Canada, France, Holland, Belgium, and Luxembourg. The parties agreed that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agreed that if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defence recognised by the Charter of the UN, will assist the party so attacked.

Changing Problems in NATO.—How can the North Atlantic Alliance be kept together? As time goes on the problems of cohesion become greater. Circumstances have been against finding a solution. First, for some years there has been no avowed threat from the Soviet Union to Western Europe. Of course NATO comprises much more than that; but this brings us to the second great change. At the beginning of NATO there were only two substantial powers in the organisation—Britain and the United States. But now two more members have become substantial powers—France and Germany. So externally the threat has diminished and internally the difficulties of cohesion have increased. The key question has been the control of nuclear weapons. The United States is clearly not going to let control over its destiny leave its own hands. Nor will other powers leave ultimate control of their own destinies to an American President. The problem is not only how to create unity; but how unity is to be made effective for, and in, a crisis. Mr. Leonard Beaton has urged that what is needed is not a committee outside governments but a committee of governments, or at least the decisive governments, with the power and advice to manage a crisis. He uses the Anglo-American relationship in the second world war to illustrate his point. In that war Prime Minister and President decided together, the issues being defined by intelligence men working together and the military men working together. In a crisis this would now need to be achieved for at least France and Germany as well; and very more quickly—in hours rather than weeks. The technique of hammering out an agreed course is the technique of the cabinet. A crisis cabinet, urged Mr. Beaton, able to act in the face of a challenge, was surely the only way to achieve unity between substantial powers such as NATO now contains. This involves extension of the apparatus of the existing Anglo-American relation.

A Crisis in NATO.—In 1966 it seemed that NATO was facing its gravest crisis since its inception in 1949. De Gaulle demanded that all foreign forces and military establishments in France should pass under French control or be withdrawn. He asked that SHAPE (NATO's military headquarters) and all other integrated headquarters then in France should be removed. In the words of *Punch* he was not only knocking SHAPE out of Europe but knocking Europe out of shape.

The New Position.—The general reason for de Gaulle's action was that the position in 1966 was fundamentally changed: (1) the threat of Russian aggression in Europe had receded for several reasons, including Russia's preoccupation with China; (2) the United States' guarantee of Europe, so important in 1949, was becoming less credible since, with the development of intercontinental missiles, America was now herself threatened with instantaneous nuclear retaliation against her own territory. It was not alliance with the United States which de Gaulle appeared to be rejecting but he was questioning the further need for integrated command and American domination of the alliance.

3. Political Organisations.

Federal Union.—The development of greater political unity among the European countries may be best introduced by a word about the federalists. The Federal Union had, before the War, urged a federation of Europe as a first step in a progression towards a world federation. The Federalists advocated the surrender of absolute national sovereignty, a part of that sovereignty being vested in a federal authority. This authority, it was urged, should possess a government responsible to peoples and not to the States. It should have a Supreme Court to settle disputes between States which are members of the federation; and have an armed police force to uphold its decisions.

The Hague Congress, 1948.—Several schools of thought were represented at the Congress, one main difference being between the federalists, who want to create a real federation in Europe, and those, like the United Europe Movement, who were not committed to a federation in so far-reaching a sense. The Congress declared that the European nations must transfer some part of their sovereign rights so as to secure common action, and it demanded an early convening of a European Assembly chosen by the Parliaments of the participating nations. But in the event the political reality has not become so radical as the surrender of any sovereign rights to the Council of Europe.

The Creation of a Council of Europe.—In May 1949 the Foreign Ministers of the ten countries consisting of the five Brussels Treaty Powers and Denmark, Eire, Italy, Norway, and Sweden, concluded a formal Agreement called "The Statute of the Council of Europe." It set up a Committee of Ministers and a Consultative Assembly, forming together a Council of Europe. The Council was established twelve months after the Hague Congress, almost to a day. The Committee of Ministers provides for the development of co-operation between governments, while the Consultative Assembly provides a means through which the aspirations of the European peoples may be expressed. The seat of the Council was fixed at Strasbourg.

Council of Europe.—The Council came into existence in August 1949, and the Assembly opened at Strasbourg when M. Spaak was elected President. Mr. Churchill (as he then was) sat as an ordinary member. Procedure is a combination of British and Continental systems, but the design of the chamber follows the Continental pattern, delegates sitting at tables arranged to form a semicircle. In November 1949 the Council of Ministers agreed to meet the wishes of the Assembly that it would not in practice exercise its right of control to fix the agenda of the Assembly.

The Consultative Assembly.—This, the deliberative organ of the Council, is empowered to debate and make recommendations upon any matter which: (i) is referred to it by the Committee of Ministers with a request for its opinion, or (ii) has been approved by the Committee. The Assembly consists of representatives of each member state appointed by national parliaments. All resolutions of the Assembly require a two-thirds majority of the representatives casting a vote. The Assembly meets annually.

The Responsibility of Members of Assembly.—The Assembly comprises over two hundred individual members of Parliament from fifteen different countries. Although they are entitled to group themselves on any particular issue if they choose, a member is in particular relationship to his country and his party or even to his constituency. There is therefore a position of some confusion and subtlety. Originally the Deputies in the Strasbourg house were seated in alpnabetical order of their names: today they sit grouped in political parties.

Relations with National Parliaments.—The attempt made by the Joint Committee between Ministers and the Assembly to act as an organ of co-ordination between the two sides of the Council did not satisfy the Assembly. It therefore set up a Working Party to analyse the relations between the Assembly and national parliaments. This Party tries to see what steps can be taken in each national parliament to secure consideration of recommendations and ratification of Conventions which have been approved at Strasbourg. They have gone so far as to appoint a spokesman for each country.

What Has the Council of Europe Achieved?—The Council plays an important part in law-making. It has itself framed and launched important Conventions like that on Human Rights, and it also frames general principles and gives opinions on texts of laws. On the diplomatic side it prepared the way for a solution of the Saar problem, which had divided France and Germany since the War. It is working on the simplification of frontier formalities, and it is concerned (in non with several other international bodies) refugees. Among other actions, it has en- aged the growth in reciprocity between tries of their social services, and established ropean Court of Human Rights.

4. Economic Organisations.

e Organisation for European Economic peration (OEEC).—We now turn to the third n, the economic. We have seen that OEEC reated to administer American (Marshall) aid. t needed also to re-create a sound European omy. The allocation of aid continued until but the practice of mutual consultation on omic matters continued in order to carry out term programmes. Owing to the nature of its al task of distributing Marshall Aid, the . and Canada became associate members of rganisation. In 1961 these two countries ed with members of OEEC the Organisation conomic Co-operation which replaced OEEC s described below.

ropean Coal and Steel Community.—A further mic development came in 1950 with the sal for the co-ordination of coal and steel ction in Germany, Belgium, France, Italy, mbourg, and the Netherlands. The organ- n of the Community is an example of co- tion on a supra-national basis, since the ning authority is not responsible to the dual governments of member countries but to the Community. The High Authority he right to deal directly with the coal and nterprises of the Community without passing gh national governments. In 1954 Great n formed a Standing Council of Association he High Authority for consultations on coal teel and for co-ordination where necessary.

European Economic Community (EEC), or arket.—In 1955 "the Six" (namely the ries in ECSC) decided to drive towards r economic integration. This decision was at Messina, and the six are sometimes ed to as the Messina Powers. The EEC was ished by a Treaty of Rome in 1958 and is an sion to the whole economic field of the institu- method of co-operation already adopted in uropean Coal and Steel Community of the The principal institutions are the Parlia- ry Assembly (which is common to EEC, , and Euratom), a Council of Ministers, and ecutive Commission of nine members. The on Parliamentary Assembly is now called uropean Parliament. The Community is ng the Six into a single economic unit by nising economic, social, and investment s and establishing a common market in

at is a Common Market?—A common market ading area with no internal tariffs (import) or quotas (which are quantitative restric- on imports) and a single external tariff and structure. The first tariff reductions inside x (10 per cent.) took place on January 1, By January 1962 there had been cuts ng 40 per cent. in internal tariffs. During he Council of the Community resolved to up the process of further reductions which, ginal intentions, would have taken from to fifteen years, so as to aim at complete isation of internal tariffs by 1966.

uropean Free Trade Area.—When the Six iscussing the Common Market the British nment declared (1956) that they would con- oining a free-trade area in Europe. Al- she would not join the Common Market e itself, she would consider sharing in the y-stage reduction of inter-European on all non-agricultural goods. They would empt (unlike the Six) to standardise their riff walls in relation to the world outside the ean free-trade area. Such a free-trade area be independently controlled with permanent nation with EEC. In November 1958 France rejected the British proposals for linking the six European common-market nations with the eleven other OEEC countries in a free-trade area. It appeared to the French impossible to establish a free-trade area between the six treaty powers and the other eleven OEEC countries without a single customs tariff between all of them and the outside world and without measures of harmonisation in the economic and social sphere.

The European Free Trade Association.—Thereupon seven countries outside the area of the Six formed a European Free Trade Association. They were Great Britain, Austria, Denmark, Norway, Portugal, Sweden, and Switzerland, and they agreed upon a plan at Stockholm in November 1959. Inside the free-trade area comprising these seven countries it was contemplated that there would eventually be no internal tariffs or quotas, but member states would retain separate external systems. The Seven, upon the foundation of their Association, immediately offered friendly co-operation to the existing Common Market. But the problem of finding a political link—called by the diplomatists the problem of the three half-crowns (seven and six)—remained a difficult one.

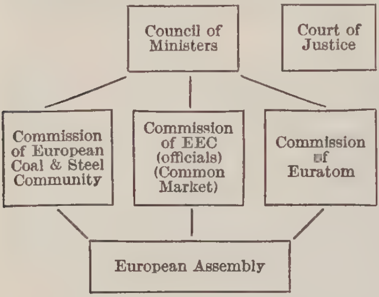
Britain's Application for Membership of the Common Market.—In the autumn of 1961 Britain applied for membership of the Common Market. Membership would provide this country with a much improved export opportunity but could lead equally to a sharp intensification of competition in our home market. In terms of population, purchasing power, production and growth, Western Europe is an exceptionally dynamic economy. The negotiations were stopped upon the veto of France in January 1963; and they were adjourned indefinitely. The political aspects of the Common Market are discussed below.

Organisation for Economic Co-operation and Development.—This new body has taken the place of OEEC. Canada and the United States, who were associated members of OEEC, joined with the eighteen members countries of that body to set up OECD. The convention was signed in Paris in December 1960, and the new body came into existence in the autumn of 1961. Thus Canada and the U.S.A. join in facing the broader objectives and the new tasks of today, namely to achieve in Europe the highest sustainable economic growth, employment, and standard of living; to contribute to economic development; and to expand world trade on a multilateral and non-discriminatory basis, in accordance with international obligations. The scope of OECD has been further widened by the accession to membership of Japan.

Economic Commission of Europe.—As explained in the preceding outline of the UN, ECE was the first of the great regional commissions to be set up by UNO. It was created in 1947 to concert action for the economic reconstruction of Europe, and it was hoped to strengthen economic co-operation between all European members of UNO. Russia and some of the Communist Eastern European countries are members of ECE, and it is the only European organisation where the Western bloc and Soviet powers can meet for discussion and action.

5. The Political Aspects of Membership of the Common Market.

The Treaty of Rome, 1958, which had established the European Economic Community defined (in Articles 2 and 3) the principles and objects for which the Community is to work. Those articles specify in detail the steps for creating a Common Market, for approximating the economic policies of member States, the promotion of harmonious development of economic activities, and raising the standard of living. But the aim of "closer relations between its member States" is stated without elaboration. It is into this gap that speculation is poured. No limit is set in the Treaty to the process of integration; on the other hand there is no commitment to join a Federation of Europe. While member States commit themselves to a common policy on a number of economic issues there will be co-ordination of national policies designed to take account of the needs of the rest of the Community.



Council of Ministers
Court of Justice
Commission of European Coal & Steel Community
Commission of EEC (officials) (Common Market)
Commission of Euratom
European Assembly

Two Kinds of Political Aspects.—We need to distinguish between two things. First, the machinery by which the aims of the Common Market are to be achieved—the Commission, the Council of Ministers, the European Assembly, Court of Justice, and so on. This may be described as the political machinery of the Common Market. Second, we have to think of the kind of political relationship which will grow up, either by deliberate design or practical development, between member countries. We may think of the first set of facts as the engine or locomotive of the Common Market train; and we can regard the second as what sort of journey the train will take—will it take a direct run to federation or follow some other line?

The Organs of EEC.—The machinery of government of the European Economic Community consists of:

1. The Council
2. The Commission
3. The Court
4. The Parliament or Assembly
5. The Economic and Social Committee; and
6. The Ambassadors of the member Governments.

The meetings of Ambassadors form unofficial permanent liaison between Council and Commission. Let us examine the five official organs.

The Council issues regulations and decisions which are, upon issue, binding in law on all member States. It consists of one member from each member State (normally a Cabinet Minister). They have votes as follows:

France	4 votes
Germany	"
Italy	"
Belgium	2 votes
Holland	"
Luxembourg	1 vote

The Commission.—Whereas the Council consists of politicians the Commission consists of permanent officials. There are nine members appointed by Governments, for a minimum term of four years and not more than two members may come from any one country. Its business is to further the general purposes of the Treaty and decisions are by majority vote. From the Commission flow two streams:—

(*a*) Proposals, which it sends to the Council.

(*b*) Under powers of its own:—

1. Decisions to named countries and binding on them.

2. Directives to named countries t achieve certain results, without specifyi the means.

3. Recommendations and Opinion which are not binding.

4. Authorisations without which mar things are forbidden.

The Court, whose procedure is wholly Contine tal, consists of seven Judges appointed by Gover ments for a maximum of six years. Its word final on the interpretation of the Treaty, on th rules made under the Treaty, and on the legalit of all the actions of the organs of the Communit

The Parliament or Assembly consists of repr sentatives of the national Parliaments. There a 142 representatives in all—36 from each of th three bigger powers, 14 from the two mediu ones, and 6 from Luxembourg. It meets once year as of right and its only power is to pass (by two-thirds majority) a vote of censure on the Con mission (the permanent officials) which must the resign. If Britain were to join its quota of men bers to the Assembly would presumably be 36. is generally held that one day the Assembly w consist of representatives elected by direct un versal suffrage but this will not occur until ever body is willing. In the meantime the Assembl can only consist of nominated parliamentarians.

The Working of the Organs: the Commission.- We look first at the Commission (of officials) this is held to be by far the most powerful of th organs. Broadly speaking, it is the only bo with a right of initiative, sending, as we have e plained, proposals to the Council which cann prepare its own proposals for consideration. T Commission can thus prevent the Council conside ing anything it does not want to be considere Its proposals to the Council can normally amended by the Council only by unanimous qualified majority vote.

The Commission prepares the budget, tak member Governments into Court, runs the agr cultural market and is the Monopoly and Restri tive Practices Court.

In addition to all this the Commission has own powers as we have explained under headi (*b*) in the earlier paragraph about the Commissio By its *decisions* it can give orders to member Stat over a wide field. For example, it can give orde on the details of applying rules of free competitic to nationalised industries or to industries wi special rights. Its *directives* order the result to achieved (for example the framework within whi agricultural prices are to be negotiated). It giv (or refuses) *authorisations* over a wide range subjects, like the postponement of the raising lowering of a tariff in certain circumstances. T powers of the Commission are thus seen to extensive and important and they affect, amo many other matters, the running of nationalis industries and the uses of Government aid.

The Powers of the Commission contrasted wi the Council.—That the Commission (of officials "Eurocrats" as they have been called) are the re rulers of the Community is more clearly seen wh that body is contrasted with the Council (politicians), quite apart from the range and in portance of the powers given to the Commissio The Commission decides by simple majority a can easily reach a decision; but the Counc which requires either unanimity or qualifi majority, is often unable to make a decision. T Commission has almost all the right of initiati It sits for a minimum of four years, while Coun members come and go. The Commission meets often as it wishes, the Council once a month. T Commission thus acquires a real personality b not the Council. It is furthermore the Co mission which controls the Community C Service.

The Bureaucratic Commission.—During B tain's first application for membership of t Common Market (1961–3) an important discuss

place in this country on the constitutional
re of the Commission and on the relative
rs of Commission and Council. A most
hant analysis of the Commission was made
Ir. William Pickles of the London School of
omics. He described the Commission as a
ucracy of a kind which it would be impossible
ntemplate in this country, for, in his view,
as entirely undemocratic. Mr. Pickles re-
d the debate in 1967 and analysed the major
opments within the Community in the past
ears (see *The Listener*, 16 Feb. 1967). He
l that, instead of a single Commission
ucracy which he had originally complained
ere was now, alongside that, and very much
shed with it, a six-nation bureaucracy (a
nittee of Permanent Representatives where
ix understudies, as it were, of the Council
bers sit permanently—with technical staffs
heir own—in Brussels). There had now
oped, therefore, two closely interlocked
ucracies, both without any kind of demo-
c control. Add to that de Gaulle's deter-
tion to fight for his national interests. We
not therefore discovered, argues Mr. Pickles,
her the Community can work without
national powers (which British Ministers
ey do not believe in). Mr. Pickles piquantly
udes that he does not want to see British
sentatives exchanging blows with the
nentals in the Community bear garden.

6. Recent Attitudes in Europe.

**oposed Merger of the Three European Com-
ties.**—The Common Market complex seemed
advancing a further step by a proposal in
for the merging of the executives of the
omic Commission, the Coal and Steel Pool,
Euratom. This meant that in 1966 there
l have been a single Commission of 14 mem-
instead of three Commissions of 23 members.
s proposed to house the new combined execu-
at Brussels which would have become the
al point for the developing drama of political
. By July 1967 the Six would have con-
ted a customs union and the question would
what kind of political system will be built to
ol the European Community with a unified
tive? France, however, was asking in 1965
evision or interpretation of the Rome Treaty
vo important points: (1) the powers of the
nission; and (2) whether a majority voting
m should replace unanimous voting in the
cil of Ministers in January 1966 as laid down
e Treaty. On the second point it should be
ined that the Treaty provides for a transition
unanimous agreement of the Council to
ted majority to be achieved by stages, the
tage from 1958–61, the second to the end of
and the third stage ending 1970. It was
tep due on 1 January 1966 which caused
tion by France. France had absented her-
or some time from the Council of the Six,
ng a serious break between her and the other
nember countries.

nce and the Five Agree to Disagree.—
e, which had withdrawn from the Council of
ters in July 1965, in violation of the Treaty
me, returned at a critical meeting at Lux-
urg in January 1966. Neither France nor
'ive were prepared for their differences to
o a total breakdown. The Treaty of Rome's
sion for majority voting remained unaltered;
rance's insistence on a right of veto was met
e Five agreeing that every effort should be
for a reasonable period to secure unanimity
sues of importance. The Common Market
survived but continued in a state of nervous
n. Everything turned on de Gaulle's
s and intentions. The four-point face-
agreement may be summaried as follows:

(1) When very important issues of one or
ore partners are at stake the members of the
ouncil will try, within a reasonable time, to
each solutions which can be adopted by all
he members of the Council, while respecting
heir mutual interests and those of the
ommunity.

(3) The French delegation considers that where very important issues are at stake, the discussion must be continued until unanimous agreement is reached.

(3) The six delegations note that there is a divergence of views on what should be done in the event of a failure to reach complete agreement.

(4) This divergence does not prevent the community's work being resumed by normal procedure.

Britain and the Common Market.—We may note the five conditions which had been set out by Mr. Gaitskell to be satisfied before Britain could contemplate joining the Common Market:

(1) proper safeguards for the Commonwealth;

(2) adequate arrangements for our partners in EFTA;

(3) firm guarantees for British agriculture;

(4) freedom for Britain to pursue an independent foreign policy; and

(5) freedom to carry out national economic planning with effective powers to safeguard Britain's balance of payments.

By 1966 Britain's trade with the Commonwealth had declined and many Commonwealth countries had made other arrangements which lessen their dependence on the British market. It remains true that EFTA countries must come within any final European pattern. Agriculture in Britain remains a difficult factor as indeed French agriculture does within the Market. The fourth item about independent foreign policy is not strong since our policy is necessarily shaped by alliances and the United Nations; and it has been doubted whether our balance of payments position would be weakened if we were part of a strong European Community. But the condition which has not been firmly enunciated and is of paramount importance is that the political arrangements of the Common Market must be democratic in form. Can the Commission which has large powers be made answerable to a properly elected European Parliament? Another condition would be that a European union would not jeopardise an Atlantic alliance. *See also* **Section G, Part III.**

Reappraisal of Attitude to the Common Market.—After the General Election of 1966 the Government made a thorough re-examination of all the arguments for and against British entry. This was the first fundamental reappraisal of the position since the Whitehall exercise in 1960 which preceded the application for membership in August 1961. Mr. Gaitskell had rated the economic pros and cons at fifty-fifty but had emphasised the serious adverse effect on the balance of payments which accession would be likely to bring in the immediate future. The reappraisal in 1966 was believed to have concluded that membership on balance would be in the British interest—that is to say, it was more enthusiastic than Mr. Gaitskell. But the July 1966 crisis occurring in the middle of this appraisal strengthened the argument of those who saw the weakness of the British economy as a barrier to membership. The Government has stated that the best estimate it could make on the then existing Community arrangements and prices was that, after any transitional period, the adverse effect on the balance of payments might be of the order of £175 million to £250 million, and on retail food prices by 10 to 14 per cent, which represents 2½ to 3½ on the cost of living. It seemed that mid-1968 might politically offer a suitable moment for Britain to join; but the argument by reference to the state of the British economy might well still apply then. Why 1968? It is in that year that the six members of the Common Market will complete their construction of a single market for both industrial and farm goods.

Britain and the Common Market: New negotiations.—The Government, however, decided in

November 1966 to open talks first with the EFTA countries and then with EEC countries to find out if the conditions did, or did not, exist for fruitful negotiations for Britain's entry into the EEC. The purpose of the conference with EFTA was to demonstrate solidarity with Britain's partners there and to help them to consider their own plans, either to apply for membership of the Common Market or to seek some form of association with it. As things then stood Sweden, Norway, and Denmark were expected to seek full membership with Britain. The Irish Republic which was outside EFTA was also expected to apply. Mr. Wilson said he would approach the discussions "with the clear intention and determination to enter the Community, if, as we hope, our essential British and Commonwealth interests can be safeguarded." Among the stiff obstacles hindering Britain's entry was of course President de Gaulle's attitude to Britain's defence arrangements with the United States. (It was the Nassau agreement that led de Gaulle to veto Britain's entry into EEC.) In his declaration of intent in November 1966—or, more accurately, of desire—Mr. Wilson said that matters of defence or of foreign policy are not directly involved in negotiations on the Common Market. It is true that there is nothing in the Rome Treaty that requires us to hand over power to a European authority or Parliament on subjects which are not related to an economic union. But economic union needs political direction and this corollary needs to be faced, although the Common Market countries themselves have not yet decided on the precise forms of its political institutions. There were of course strong economic obstacles, as we have indicated, in regard to both balance of payments and cost of living.

EFTA Countries and the Common Market.—Not all Britain's partners in EFTA want to join the Common Market. Switzerland doubted whether membership would be compatible with its neutrality. Austria has been negotiating associate membership for some time; but even if accepted it is doubtful if the Soviet Union would sanction it under the terms of the Austrian Peace Treaty which established Austria's neutrality. Portugal was unlikely to apply, or to be accepted so long as her economy remains a weak on Finland was unlikely to seek more than associa membership, for a mixture of economic ar political reasons. That leaves Sweden, Norwa and, above all, Denmark, who really see membership.

Last Industrial Barriers down in EFTA.—A fr trade area for industrial goods among the seve members, supplying a market of 100 millic people, came into existence on 1 January 196 when the last 20 per cent barrier of protectiv tariffs was removed, thus completing a proce begun by stages in July 1960. This complet dismantling of tariffs was three years ahead schedule. Most agricultural and marine produc continued to be subject to tariffs.

Need for Large Free Trade Area: the altern tives.—This is not the place to examine the ec nomic pressures behind the approach to membe ship of the Common Market. More and mor industries are discovering that a large tariff-fre market is necessary not only to justify large, lov cost productions but to generate the resources t finance research and development. But we ma note some political aspects. A possible alterna tive might be an Anglo-Saxon free trade are containing U.S.A., Canada, Britain, and bits c EFTA. This is the "51st State" solution. I would mean eventually a far larger ownership c British industry by the U.S.A. and perhaps ever tually the absorption of Britain. (The Commor wealth alternative continues to shrink. Nigeri is an associate of the Common Market and Ea African states should follow by 1968. Malaysia New Zealand, and Australia are being drawn mor and more into Asian trade.) Other politica aspects are: (1) will the Common Market wish t and be able to, develop common policies toward Eastern Europe including eventually commo policy on Germany unity? An effort to open u a new relationship with Eastern Europe is or which would be likely to attract de Gaulle; an (2) what should be the relationship of Americ to a more united Europe? It must be a lon time before Britain could contemplate th abandonment of NATO.

MEMBERSHIP OF EUROPEAN AND WESTERN ORGANISATIONS

(M is full membership, AM associate membership)

	Military			Economic			
	NATO.	WEU.	Council of Europe.	OECD.	ECSC. Euratom, and EEC.	EFTA.	ECE.

A LIST OF SOCIETIES.

On this page are the addresses of some of the societies working in the fields of social service and international affairs. They are only a selection from all the societies working in these and allied spheres.

What the Societies Offer.—Many of the societies offer the facility of a unique specialised library, and most of them issue not only journals and magazines but pamphlets giving the latest authoritative views and discussions of contemporary problems. Besides these facilities the associations offer the individual the opportunity of hearing experts and of discussing the subject with others interested in the same subject. Many societies hold not only lectures but conferences, covering the week-end or several days, and some of them hold Summer Schools.

Social Service.

The National Council of Social Service (26 Bedford Square, London, W.C.1) is the main promotional and co-ordinating organisation of voluntary social work in Great Britain. It publishes *Handbooks on Voluntary and Public Social Services and Directory of Organisations.*

The Annual Charities Register and Digest is a famous reference book prepared by the Family Welfare Association (address below). It is a standard guide to every branch of charitable work, giving details of Adoption Societies, Almshouses, Homes for Incurables, Convalescent Homes of all kinds, and all Welfare Institutions.

Some useful addresses are:—

British Association of Residential Settlements,
Bishop Creighton House, 378 Lillie Rd., S.W.6.
Central Council for Health Education,
Tavistock House, Tavistock Square, W.C.1.
Citizen's Advice Bureaux Service,
26 Bedford Square, W.C.1.
Family Planning Association,
231 Tottenham Court Rd., W.1.
Family Welfare Association,
296 Vauxhall Bridge Rd., S.W.1.
Industrial Welfare Society,
48 Bryanston Square, W.1.
Institute for the Study and Treatment of Delinquency,
8 Bourdon St., Davies St., W.1.
National Association of Parish Councils,
26 Bedford Square, W.C.1.
National Association of Boys' Clubs,
17 Bedford Square, W.C.1.
Scottish Association of Boys' Clubs,
12 Alva St., Edinburgh, 2.
National Association of Youth Clubs,
30–2 Devonshire St., W.1.
Scottish Association of Girls' Clubs,
13 Eglington Crescent, Edinburgh, 12.
National Council of Women,
36 Lower Sloane St., S.W.1.
National Council of Y.M.C.A.'s,
112 Great Russell St., W.C.1.
10 Palmerston Place, Edinburgh, 12.
22 Howard St., Belfast.
National Federation of Community Associations,
26 Bedford Square, W.C.1.
National Federation of Women's Institutes,
39 Eccleston St., S.W.1.
Federation of Women's Institutes of Northern Ireland,
28 Bedford St., Belfast.
National Federation of Young Farmers' Clubs,
55 Gower St., W.C.1.
National Marriage Guidance Council,
58 Queen Anne St., Grosvenor Square, W.1.
National Union of Townswomen's Guilds,
2 Cromwell Place, S.W.7.
Save the Children Fund,
29 Queen Anne's Gate, S.W.1.
Scottish Council of Social Service,
10 Alva St., Edinburgh, 2.
Northern Ireland Council of Social Service,
28 Bedford St., Belfast.
Tavistock Institute of Human Relations,
3 Devonshire St., W.1.
Young Women's Christian Association,
108 Baker St., W.1.
18 Atholl Crescent, Edinburgh, 3.
385 Malone Rd., Belfast.

International Co-operation.

The National Peace Council (29 Great Jam St., W.C.1), is a federation of national societi concerned in the promotion of peace. It publish the *Peace Year Book*, which contains a directo of societies working for peace.

United Nations Association,
25 Charles St., W.1.
Union of Democratic Control,
13 Prince of Wales Terrace, W.8.
Women's International League for Peace a
Freedom, 29 Great James St., W.C.1.
International Voluntary Service,
72 Oakley Square, N.W.1.
British Society for International Understandin
Benjamin Franklin House, 36 Craven S
W.C.2.
International Friendship League,
Peace Haven, Creswick Rd., W.3.
Friends Peace Committee,
Friends House, Euston Road, N.W.1.
Africa Bureau, The,
65 Denison House, Vauxhall Bridge R
S.W.1.
Britain in Europe Committee,
43 Parliament St., S.W.1.
Fabian International Bureau,
11 Dartmouth St., S.W.1.
English Speaking Union,
37 Charles St., W.1.
Council for Education in World Citizenship,
25 Charles St., W.1.
Royal Institute of International Affairs,
Chatham House, 10 St. James's Squa
S.W.1.
Parliamentary Group for World Governme
House of Commons, S.W.1.
Fellowship of Reconciliation,
29 Great James St., W.C.1.
Campaign for Nuclear Disarmament,
2 Carthusian St., E.C.1.
War on Want, 9 Madeley Rd., W.5.
Institute of Race Relations,
36 Jermyn St., S.W.1.
United World Trust,
29 Great James St., W.C.1.
Oxford Committee for Famine Relief,
274 Banbury Rd., Oxford.
British Council of Churches,
10 Eaton Gate, S.W.1.
World Assembly of Youth (British Natio
Committee), 57 Charlton St., N.W.1.

Some Other Societies.

Political and Economic Planning,
16 Queen Anne's Gate, S.W.1.
Howard League for Penal Reform,
6 Endsleigh St., W.C.1.
Progressive League,
13 Prince of Wales Terrace, W.8.
Ethical Union,
13 Prince of Wales Terrace, W.8.
Electoral Reform Society,
Albany Institute, Creek Rd., S.E.8.
Women's Co-operative Guild,
348 Grays Inn Rd., W.C.1
Workers' Educational Association,
27 Portman Square, W.1.

(*Note:* Unless otherwise stated the ab addresses are in London, and this is furt indicated by the postal number, *e.g.*, S.W Correspondents writing from places other th London should include "London," as well as postal number, in the address.)

COMMON LAW — CASE LAW — EQUITY* — STATUTE LAW

B.—The Sub-divisions

I. Constitutional Law.	II. Criminal Law, dealing with the relations between the individual and the State.	III. Status.	IV. Law of Persons,* dealing with the relations between one individual citizen and another, established—		V. Law of Property.*		
Main Principles: 1. The Supremacy of Parliament. 2. The Rule of Law. (a) *The Legislature:* The franchise, elections, Parliamentary procedure, relations between Lords and Commons, Bills and Acts. (b) *The Executive:* The Crown, the Ministry, Government Departments and their powers. (c) *The Judiciary:* The Courts and their functions, the Judges, means of controlling the Executive and inferior courts. (d) *Local Government:* County, Borough, Urban and Rural District and Parish Councils and their powers. (For further details, see Section C, Part II.)	A. Grave offences against— 1. *Public Order:* Treason, sedition, riot, blasphemy, obscenity, forgery, bigamy, perjury. 2. *Persons:* Homicide, assault, sexual offences. 3. *Property:* Larceny, burglary, housebreaking, false pretences, blackmail. Subsidiary matters: (*a*) Criminal responsibility. (*b*) Unconsummated Crimes. (*c*) Joint Crimes. (*d*) Punishment and its purpose. B. *Petty Offences, e.g.*, Road Traffic, Factories and Shops, Sale of Food, etc. (dealt with by J.P.s)	1. Nationality. 2. Domicil. 3. Marriage and Divorce. 4. Infancy. 5. Lunacy. 6. Bankruptcy. 7. Corporations.	1. *By act of parties (Law of Contract):* (1) Simple Contracts. (2) Deeds: (*a*) Capacity of parties. (*b*) When writing necessary. (*c*) Mistake. (*d*) Misrepresentation. (*e*) Duress and undue influence. (*f*) Illegality. (*g*) Breach.	2. *By Law (Law of Tort):* Civil Wrongs committed against— (1) *The Person:* Trespass, assault, malicious prosecution, and false imprisonment. (2) *Land:* Trespass, Nuisance. (3) *Other Property:* Trespass, Conversion. (4) *Persons towards whom there is a duty to take care:* Negligence. (5) *Reputation:* Defamation (libel or slander). (6) *Personal and Trade Relationships:* Seduction, enticement, trade molestation *and*— (a) *Liability.* (b) *Immunity.* (c) *Effect of Death.* (d) *Remedies.*	In General: 1. *Living Persons:* (Effect of Status on Ownership). 2. *Deceased Persons:* (Wills and Intestacies, Probate and Administration).	In Land (Immoveable Property): 1. Freeholds (Settlements). 2 Leaseholds. 3. Mortgages. 4. Title. 5. Joint Ownership.	In Other Property (Moveable Property): 1. Chattels. 2. Things in action.

* *Note:* Equity is applied only in matters of civil law relating to persons and property. It has no application to constitutional or criminal law.

THE LAW OF ENGLAND

THE Table set out on D3 shows in concise form—

A—the sources, and
B—the subdivisions

of the Law of England. The intention is to give a general picture of the whole system in tabular form
to explain briefly what the Table represents, and finally to deal, in slightly more detail, with a fe
selected subjects which may be of particular interest to the ordinary reader.

A word of warning is necessary. Learned text-books have been written on every one of the man
subjects referred to in the Table, and the application of the law in any particular case is a matter fo
the professional expert. The following pages do not claim to do more than to make a brief surve
of the whole field of English Law, for the general guidance and interest of the ordinary citizen.

A. THE SOURCES OF ENGLISH LAW

The citizen who desires to make some acquaintance with the English Legal System must begin by disabusing himself of several popular fallacies: for example, that it is a fixed and unalterable code, that it is strictly logical, that it is coldly impersonal and uninfluenced by human factors. The history and practice of the law display precisely the opposite characteristics.

1. COMMON LAW AND CASE LAW

The English Legal System is a *living organism*, not a dead, static code. The system as we know it began to develop in the twelfth century, when Henry II extended the practice of sending the royal judges about the country "on circuit," to deal with crimes and disputes, and to adapt and give official authority to the best of the local customs, some of which had been in force since Anglo-Saxon days. The judges did this by *empirical methods*—that is, by practical, commonsense decisions on the actual cases brought before them, and by setting out their reasoning in detail. Simple records of the most important decisions were kept from the earliest times; as the centuries passed, the gradual elaboration of a system of *law-reporting* ensured that the *facts* of significant cases, the *reasoned judgments* delivered on those facts, and the *principles* those judgments enshrined, should be recorded and preserved; at the same time the doctrine of *precedent*—the rule that those principles, enunciated by a superior court, should be followed by all courts inferior to it—ensured consistency throughout the country. Thus there was gradually developed a body of principles—living, growing, and adaptable to new sets of facts as they arose; principles, moreover, which rose above local differences of custom and became *common* to the whole Realm. Hence the expression *common law*.

Case Law. The system we have described is by no means a thing of the past: it is still in force today. New circumstances are continually arising; cases come before the judges for decision, and it frequently happens that the principles laid down in the past do not apply precisely, in all respects, to the particular facts in point. When this occurs it is the judge's right and duty to *interpret and adapt the principle to the new facts* before him; his judgment is reported, and his reasoning made clear. The adapted principle of that judgment becomes part of the law of England; it must be followed by all inferior courts; and it will not be ignored or abandoned by courts of the same rank, or any superior court, without reasoned argument and careful consideration. Thus the practising lawyer can never sit back with the comfortable assurance that he has "completed" his studies; he must continually keep his knowledge up to date. The practice of law is not a science, based on rigid rules, but an art—the art of *applying the known principles to the facts of new cases* as they arise.

In July 1966 the House of Lords (the Suprem
Court of Appeal) announced that it would hence
forth regard itself as free to depart from its ow
previous decisions when it appeared right to do s
though this power would be sparingly used.

2. EQUITY

But the English genius for practical improvisa
tion has never excluded spiritual and *ethic*
motives of conduct. For hundreds of years th
Church was a great power in the land, extendin
its influence far beyond the strictly ecclesiastica
sphere. The great church-leaders of the past too
an important part in the secular activities
government and administration; from an earl
date the King's Chancellor was an ecclesiasti
The Chancellor was not only the King's Secretar
of State and Keeper of the royal seal; as roya
chaplain he was "the Keeper of the King's con
science." It was to him, therefore, that the Kin
turned for advice on matters of state where *ethic*
and moral considerations were involved.

All human institutions are fallible, and th
rough-and-ready methods of the early commo
law sometimes fell short of those ideals of abstra
justice that inspire men's minds. Despite,
perhaps because of, its practical outlook, th
common law tended to become circumscribed b
its own precedents. As the machinery of justic
became more elaborately organised, the idealist
doctrine—"Where there is a right there is
remedy"—was apt to degenerate, in practice, int
the realistic but soulless form—"Where there is
legal remedy, there is a legal right." Too close a
adherence to legal formalities led sometimes to
denial of justice. This was particularly so for th
weak, who could not help themselves—feebl
minded persons, tricked or cajoled into "legally
signing away their property; infants unconscio
ably treated by guardians who, having got leg
custody (under a will or otherwise) of the infant
inheritance, refused to honour their solemn trus
borrowers who, having delayed beyond the da
fixed for the repayment of a loan, found themselv
deprived, under the strict terms of the mortga
deed, of property many times more valuab
which they had pledged only as security. F
such cases as these the common-law cour
provided no remedy, since the victims had suffer
no actual illegality. Petitions were therefore se
to the King, "the father of this people," beggi
him to right such wrongs; and the question
redress was delegated by the King to his Cha
cellor. The Chancellor had no power directly
revoke or interfere with the decisions of the roy
judges by depriving the oppressive party of t
property he had "legally" acquired, but he coul
and did, insist that that party should not enj
such acquisition, *unconscionably*, for his own s
advantage. The defaulting guardian, though
continued legally to hold the infant's propert
was compelled to use it for the infant's benef

ppressive creditor, who had legally got ssion of or sold the debtor's estate, was perd to take out of the proceeds the amount of an, with reasonable interest and expenses, nust hand back the balance to the debtor. the Chancellor administered a kind of *ct justice*, based upon the promptings of cone, and not on legalistic rules. He dealt with cases in his own court—the Chancellery or *ery*—where the yardstick was *equity*—that was right or fair. And over the centuries rinciples on which the Court of Chancery became crystallised into a set of rules which ed their own precedents and made *conious conduct* their guiding star.

urally enough, the activities of the Court of ery were viewed with jealousy and mis by the royal judges of the Common Law s, and many were the clashes between the Equity, however, had come to stay, and o systems were administered independently as late as 1873. In that year Parliament the Supreme Court of Judicature Act, (in effect) fused the two systems into one. eans of that and subsequent legislation there nstituted *one High Court of Justice*, of which *een's Bench Division*, the *Chancery Division*, e *Probate, Divorce* and *Admiralty Division* mponent parts. The first-named is con primarily with common-law suits, the with equitable matters; but both these ons must have regard to *both common law uitable principles*. In case of a conflict of ples, those of equity are to prevail. The amed Division (for historical reasons) deals he diverse subjects of wills and intestacies, nonial suits, and disputes relating to ships Criminal cases fall within the jurisdiction Queen's Bench Division, but are dealt with cial courts. The criminal law (in strict s to accused persons) must be absolutely and clearly defined; it is administered on legalistic principles, from which the docof equity are excluded. (For further details Courts and their functions, *see* **Section C 35–6.**)

3. STATUTE LAW

le, as we have shown, the Courts have the n of *interpreting and adapting* the principles of law laid down in earlier times, they cannot legislate—*i.e., the Judge cannot make new laws*, or repeal or amend old laws, even when changes are rendered desirable by developing social conditions. The law-making body, or *Legislature*, is *Parliament*. *A Statute* or *Act of Parliament* is the joint act of the Queen, the House of Lords, and the House of Commons; while each of these three "Estates of the Realm" has its own functions, new law can be made, and old law repealed, only by these three Estates acting together, *i.e.*, by *Parliament*, or by some person or body of persons to whom Parliament has *delegated authority* to make *rules having the force of law*. Parliament is free of control by any written constitution or any person or body of persons whatsoever; an Act of Parliament must be enforced by all courts as the law of the land, unless and until it is repealed or amended by Parliament itself. Parliament is not bound by the Acts of a previous parliament, which it is free to repeal or amend as occasion may require. It is equally free to modify the rules of the common law and the rules of equity, however firmly entrenched; but those rules, unless and until modified by parliamentary legislation, continue to guide the Judges both in their interpretation and enforcement of *Statute Law*—*i.e.*, the body of Acts of Parliament still in force for the time being—and in their decisions on those common-law and equitable rules which the Statute Law has left untouched. For example, the Peerage Act, 1963, enables a peer to renounce his title and to become a commoner for all purposes, including voting for, and standing as, a candidate for the House of Commons. And by the Law Commission Act, 1965, a body of Commissioners was appointed: (1) to consider various branches of the law; (2) to consolidate and codify the law wherever possible; (3) to draft reforms on certain subjects. The Commission's First Report was issued in June 1966.

THE ENGLISH LEGAL SYSTEM

These three main streams—*common law* (and *case law*), *equity*, and *statute law*—have flowed throughout the centuries, sometimes independently and sometimes in conjunction, to feed the waters of that great river which is the *English Legal System*.

B. THE SUBDIVISIONS OF ENGLISH LAW

I. CONSTITUTIONAL LAW

is that part of the English Legal System relates to four main branches of national istration:—

(a) *The Legislature*—*i.e.*, the *law-making* dy known as Parliament.

(b) *The Executive*—*i.e.*, the *Government* d the functions of its various components.

(c) *The Judiciary*—*i.e.*, the *Judges*, their *urts* and powers.

(d) *Local Government*—*i.e.*, the *Local uthorities* and their powers.

two main principles of the Constitution

he Supremacy of Parliament.—*I.e.*, there is that Parliament cannot lawfully do, and s no person or body of persons above nent. Its Acts cannot be unconstitutional, can itself modify the Constitution at will. s for the time being in force are the law of d, and nobody can question their validity.

e Rule of Law.—This means that no person of persons is above the law of the land, and ere is one system of law, and one system for everybody. There is not in England, e is in some other states, a special system of special courts for scrutinising the acts of rs, civil servants, or other functionaries; ersons are bound by the same rules of conduct as other citizens. (At the moment of writing (Dec. 1966) an Act of Parliament has set up the office of "Parliamentary Commissioner for Administration" or "Ombudsman"—an official to whom complaints of injustice by Government departments may be made. The last name is borrowed from a Scandinavian institution.) A complaint by a private citizen against a Secretary of State or a Commissioner of Police is investigated by the same courts, and under the same legal rules, as a complaint against another private citizen. An apparent exception will be found to result from some special provision in an Act of Parliament itself. For example, the Army Act sets up a code of conduct for officers and soldiers, and does not apply to civilians; but that code is part of the Law of England because it is contained in an Act of Parliament—a code which (incidentally) remains valid only if it is confirmed by Parliament in every successive year. Again, the Emergency Powers (Defence) Act, 1939, conferred upon the Crown and its Ministers extensive powers, during the last War, to make Defence Regulations which should have the force of law; but the Act itself had to be passed by Parliament with the proper formalities. Such Regulations derive their legal and binding effect solely from the *powers delegated by Parliament*; and the High Court of Justice is competent to scrutinise, and frequently does scrutinise, the wording of the Regulations and the manner in which those powers are exercised, and to satisfy itself that the Minister concerned is not attempting to exceed the authority which Parliament has vested in him—in other words, to protect the citizen against the *arbitrary abuse of lawful powers* and against their *unlawful enlargement. Delegated legislation* is always subject to such control; parliamentary legislation is not, since *nobody can question the validity of an Act of Parliament.* But the *interpretation* of any Act of Parliament—the ascertainment of its legal meaning and effect—is one of the proper functions of the Courts.

II. CRIMINAL LAW

This is that part of the English Legal System which deals with the relations between the individual citizen and society as a whole. Thus, if A murders or robs B, the question of redress is not one merely for B or his family; the victim cannot, in a civilised community, be permitted " to take the law into his own hands," nor can it be left to him to decide what action should be taken against the offender—otherwise blood-feuds and public disorder would result. For that reason it has been the law for centuries past that, in the case of offences (1) against public order, (2) against the person and (3) against property, *the State (representing society as a whole) itself intervenes* and *prosecutes* the offender, for the purpose of upholding public order and vindicating the rule of law by inflicting *punishment* upon him—*not* for the purpose of *compensating* the injured party (which, as will be seen below, is the contrasting function of *Civil Law*). But the *programme* of Government legislation includes consideration of the payment of compensation for personal injuries to victims of violent crime. Meanwhile, payments are *ex gratia*, within the discretion of the Criminal Injuries Compensation Board for an experimental period, based on the 1964 Report (and *see* D36(2)). For offences against public order, *see* D40–42.

The two main categories of Crime (as the Table shows) are:—

(a) *Grave (or Indictable) Offences*, which are dealt with at Assizes, the Central Criminal Court, and Quarter Sessions, and which carry severe penalties—death or lengthy sentences of imprisonment (death only for treason in time of war); and

(b) *Petty Offences*, which are dealt with in *Magistrates' Courts*, and are punishable by light sentences of imprisonment or by fines (with short sentences in the alternative). Examples of this latter class are (*e.g.*, under the Road Traffic Acts) driving without due care and attention, exceeding the speed-limit, causing an obstruction, etc. (*See also* **Justices of the Peace, D39.**)

Examples of (a) *Grave (or Indictable) Offences* are set out in the Table under the three main headings of:—

(1) *Offences against Public Order*;

(2) *Offences against the Person*; and

(3) *Offences against Property.*

In connection with all these categories of offences the *Criminal Law* is concerned with the following general considerations:—

(a) **Criminal Responsibility.**—*I.e.*, the primary principles that every person is presumed (until the contrary is proved) to be sane and " to intend the natural consequence of his acts," provided that those acts themselves are *voluntary* (*i.e.*, *intentional*) on his part. It would, for example, be absurd for a man, accused of wounding another person by shooting, to plead that he did not intend, when he discharged the firearm at the other person, to do him any bodily harm. On the other hand, it would be outrageous to convict and punish a child of four who, without understanding the wrongfulness of his behaviour, picked up and took away some attractive and valuable object from a shop-counter; a lunatic who killed somebody under an insane delusion that the victim was a wild beast; a boy (like Oliver Twist) who was compelled, by force or violent threats, to break into a house, or a man who took an overcoat from a public cloakroom, honestly but mistakenly believing it to be his own. In none of these last illustrations is the act a *voluntary* one in the sense that there was the *intention to do something wrong.* To the rule that an act is not a crime unless it intentional in this sense there are a few ra exceptions—cases where an Act of Parliament h expressly and clearly made some form of *condu punishable in itself*, whether it was intentional not; for example, during the War, permitting light to be visible in black-out hours was punis able, even if it was unintentional and involunta on the part of the accused.

Intention must not be confused with *moti* For example, in what has become known " mercy-killing "—*i.e.*, taking the life of a pers suffering from a painful and incurable disease the killer is often actuated by a good *motive*—th desire to relieve hopeless suffering; but the *inte tion* is to kill, and the act is therefore a crim (It is not necessary for the prosecution to pro any motive.)

The *burden of proof* in criminal cases is on th prosecution, *i.e.*, it is the duty of the prosecutio to prove the accused guilty; not the duty of th accused to prove his innocence. The accused presumed to be innocent unless and until h guilt is proved to the reasonable satisfaction of jury. The jury are the sole judges of the tr facts of the case, and their verdict had to be unan mous until recently; but by the Criminal Justi Bill, 1966, it may now be by a majority of 10 to The Bill will also contain a clause for maj changes in committal proceedings by magistrate Prosecution evidence at those proceedings henceforth to be given in writing both to mag strates and to the accused. If either side wish to hear evidence at this stage by word of mout they can request it.

(*b*) **Unconsummated Crimes.**—*I.e., attempts* commit crimes which are frustrated by some ou side event or by some person's intervention. F obvious reasons the *attempt* to commit a gra crime is *itself an offence* for which the offender ca be prosecuted and, if convicted of the attemp punished by fine or imprisonment. *Incitement*, b one person, of another to commit a crime, an *conspiracy* between two or more persons to comm a crime, are usually offences in themselve whether the incitement or the conspiracy prov successful or not.

(*c*) **Joint Crimes** are those in which two or mo persons take part. Such participation may ari in different ways. A *principal in the first degree* the man who commits the actual offence wit *guilty intention* (see (*a*) above), or who induces i commission by some other person who himse does not understand what he is doing. A *princip in the second degree* is one who *aids and abets* th guilty perpetrator at the time when the crime committed. An *accessory before the fact* is one wh *instigates* or *helps to prepare* the commission of th crime by another person, though not himse present when that other person commits it. I most cases of *grave crime* all these *three classes participants* in a crime are *equally guilty*, an liable to the same punishment, provided that all them shared the same *common criminal purpos* (Thus, if two armed burglars break into a hous with their weapons drawn, and one of them shoo and kills the householder, both will be guilty murder; while the accomplice who helped to pla the burglary will be equally guilty if the pla included the carrying of loaded weapons.) A *accessory after the fact* is one who, knowing that *felony* (generally speaking, a grave crime involvi *violence*) has been committed, shelters or receiv one of the participators to enable him to elu justice. This latter kind of accessory is liable prosecution, but the penalty in his case is le severe than that imposed upon any of the oth three classes.

(*d*) **Punishment and its Purpose.**—The purpose punishment is fourfold:—

(i) *Retribution*—to demonstrate to t community in general that crime " does n pay " and thus to uphold the rule of la and to prevent the deterioration of pub morals;

(ii) *Prevention*—to restrain offenders, so far as possible, from repeating their crimes by keeping them in custody;

(iii) *Reformation*—to make them, so far as possible, better citizens by means of moral and ethical training—teaching them to "go straight"; and

(iv) *Deterrence*—to inspire among offenders and would-be offenders a fear of and a healthy respect for the law and the strength of society as a whole, which it protects.

ere has been much controversy on the relative
rtance of these four functions of punishment.
ng the past half-century, *reformation* of the
der, whenever possible, has become a para-
nt aim.

e Murder (Abolition of Death Penalty) Act,
provides that no person shall suffer death for
ler; a person convicted of murder shall be
nced to imprisonment for life. In passing
nce the Court may declare the minimum
d which it recommends the Home Secretary
ow to elapse before he orders the murderer's
se on licence. The new Act is to continue
rce until 31 July 1970, and then expire unless
Houses of Parliament pass contrary resolu-
; if the new Act does expire, the law as it
ed before the passing of the new Act shall
come into operation.

III. STATUS

person's *Status—i.e.*, his legal position in
ty—affects his legal rights and duties in most
matters and, in some few cases, in criminal
ers too (see *Criminal Responsibility*, D6).

Nationality, in this connection, means British
nality under the British Nationality Acts,
atest of which was passed in 1965. By the
Act the term "Commonwealth Citizen" was
ed which can be used as an alternative to
h Subject. A person may be a British sub-
y birth, by naturalisation, by marriage, or by
ration, though under the Act of 1948 a
n who was not a British subject before
age does not automatically acquire British
nality merely by reason of her marriage to a
h subject. The law and the courts of this
ry can determine whether a person is a
h subject or an *alien*; they cannot determine
her or not he is a citizen of some particular
n state, since that is a matter for the law of
oreign state concerned. Generally speaking,
nes of peace, an *alien* in this country has the
rights and duties as a British subject, except
n *alien* has *no right to vote* in parliamentary
nicipal elections, and that some professions
hat of a solicitor) are closed to him. By the
f 1964, a person who is *stateless* may apply
registered as a citizen of the U.K. and
ies if either parent was such a citizen when
s born, or if the place of his birth is within
.K. and Colonies at the time of his applica-
By the Act of 1965 *alien wives* of those
h subjects who are *not citizens of any
onwealth country* may be *registered* as British
cts.

Domicil means the country where a person
is *permanent home* without any present
ion of changing it. His *domicil of origin* is
f his parents while he is under twenty-one;
hat age he is free to acquire a new domicil
aking his permanent home elsewhere.
cil is of particular importance in matters of—

Marriage and Divorce.—English law generally
s as valid a *marriage ceremony* carried out
country after the proper preliminaries and
he proper formalities, whatever the nation-
r domicil of the parties. English law also
s the validity of a *marriage ceremony* which
en carried out abroad according to the law
country where it took place. But if one
or the other has an *English domicil*, the *status of the marriage as an institution* must depend on English law, whether the *ceremony* was in proper form or not. For example, a man who has his permanent home in England cannot evade the English rule against consanguinity by going through a *ceremony* of marriage, in Ruritania, with his mother's sister—even if such a marriage is lawful by Ruritanian law, and even if the ceremony has been carried out with the usual Ruritanian formalities, it is still *null and void* by the law of England. The English court will *not*, generally speaking, grant a *divorce* to a man who is *domiciled abroad*, since the law of the country which is his permanent home may not recognise this divorce, or perhaps any divorce, as valid; and it is improper that he should be regarded as a single man in England and a married man in his homeland. Similarly, English law *will* generally recognise the validity of a divorce granted by the proper court of his domicil (*i.e.*, of the state where he had his permanent home at the time) or of a divorce which the law of his domicil regards as valid, even if it was granted by a court elsewhere—and that whether he is a British subject or not. But a person, whatever his nationality, whose permanent home is in England will not be regarded here as validly divorced merely because he has spent a few weeks in Barataria, where divorce procedure is simple, and has been granted a decree there. His *status*—married or single—generally *depends on the law of his domicil—i.e.*, the law of the country which is his permanent home. (*See also* **D24–32.**)

4. Infancy is the status of a person under the age of twenty-one. An *infant cannot vote at elections*; he *cannot hold freehold or leasehold property*, and *he cannot be made bankrupt*. (In exceptional cases where the debt is for "necessaries" (D10(1)), a bankruptcy notice may be issued against an infant.) If he enters into certain kinds of *contracts* during his infancy he *can repudiate* them, if he so desires, up to a reasonable time after his twenty-first birthday. He *cannot make a valid will*, and his rights under another person's will or settlement cannot be compromised or altered without the leave of the High Court. An infant *cannot make a valid marriage without consent* of his parent or guardian, or of the appropriate court. His rights are at all times the special care of the Chancery Division of the High Court, which will protect those rights according to the Rules of Equity (*see* **D5.**)

5. Lunacy, in the broad legal sense, is the status of a person who is "incapable, by reason of unsoundness of mind, of managing his affairs." "Lunacy" in this sense is not necessarily identical with any of the mental conditions to which such psychological terms as "insanity," "imbecility," "idiocy," and the like are applied; there need be no actual mental *disease*. When a person becomes incapable, for this reason, of managing his affairs, the law, in order to protect both him and society at large, *changes his status* by putting the custody of his person, or the control of his property, or both, into reliable hands. Such matters come under the supervision of the Chancery Division, since one of the functions of Equity (see above) is to protect those who cannot help themselves. Certification of "insanity" (in the psychological sense) is not necessary; but with the proper medical certificate and legal safeguards the *patient* (as he must be called) may be removed to a mental hospital. Some reliable person (usually a near relative) may be appointed, by an Order of the *Court of Protection* (a branch of the Chancery Division), as *Receiver* of his property. The Receiver's duties are to look after the property and income of the patient, pay his debts and defray the expenses of his maintenance and medical care, and generally to deal with the patient's property on the patient's behalf. Periodical accounts must be submitted to the Court, which will scrutinise them strictly and at once intervene if there appears to be any irregularity on the part of the Receiver. If there is no relative to take the responsibility, the *Official Solicitor* at the Royal Courts of Justice will be appointed as Receiver, with the same duties and liabilities.

Apart from these matters of administration, a person of unsound mind is regarded as incapable of making a valid will, of entering into a legal agreement, or of dealing with his property. None of these transactions is valid unless the person concerned *understood the nature and effect* of what he was doing; and whether he did understand or not is a question of *evidence* in every individual case: medical and other witnesses must testify to his conduct and demeanour at the time when he entered into the transaction in question. If the Court comes to the conclusion that he was unable to understand the nature and effect of the transaction, the Court will *rescind—i.e.*, set aside or cancel—the transaction, even though it was in proper legal form.

If a person does an act which, if *voluntary or intentional*, would constitute a *crime* (see *Criminal Responsibility*, D6), and his legal advisers put forward a defence of insanity, the general rule is stricter; he can still be convicted unless he can prove, to the satisfaction of a jury, that he was "suffering from such a *defect of reason*, due to *disease of the mind*, as not to know the *nature and quality of the act* he was doing, or (if he *did* know this) not to know that what he was doing was *wrong*." Medical men, psychologists, and social reformers have long regarded this rule (which has been in force since 1843) as too severe. It was a rule applicable to *all crimes*; but the controversy became associated in the public mind chiefly with *murder*. As a result of a long period of agitation and discussion the rule was amended by section 2 of the Homicide Act, 1957; but *only in its application to murder cases*. It is now provided that "a person who kills (or is a party to the killing of) another shall *not* be convicted of *murder* if he was suffering from such *abnormality of mind* as substantially *impaired his mental responsibility* for his acts and omissions in doing, or being a party to, the killing." (It does not matter whether the "abnormality of mind" arises from "a condition of arrested or retarded development of mind," or from "any inherent causes," or is "induced by disease or injury.") The Act goes on to provide that a person who, under the old law, would have been convicted of murder shall instead be liable to be convicted of *manslaughter*.

In other crimes, where the accused person is clearly proved to have been insane at the time the crime was committed, the verdict is now "Not guilty by reason of insanity."

6. Bankruptcy is the creation of Statute Law—there was no common law of bankruptcy. It is the status of a person (the "debtor") who is *insolvent—i.e.*, who is unable to pay his debts (exceeding £50) as they fall due. By the appropriate procedure the State takes the management of the debtor's property out of his hands and places it in the hands of the *Official Receiver*, whose duty it is to realise it and (subject to certain privileged claims) to distribute it *proportionately among his creditors*. The procedure is that one of the creditors files at the Bankruptcy Court a *bankruptcy petition*, on which the Court may make a *receiving order*, which has the effect of *transferring the legal management* of the debtor's property to the Official Receiver. That official investigates the debtor's finances and draws up an account, called a *statement of affairs*, showing the debtor's liabilities and assets. There is a *meeting of creditors* and a *public examination* of the debtor in Court, as a result of which the Court may either *discharge the receiving order* (on the debtor's showing that he can pay his debts, if he is given time, or persuade the general body of creditors to accept his proposals for a *composition* of so much in the £), or the Court may *adjudicate* the debtor a bankrupt. In the latter case it is open to the creditors either to leave the management of the debtor's property in the Official Receiver's hands or themselves to appoint a *trustee in bankruptcy* (usually an accountant) nominated by some or all of them, and that trustee takes over the management of the debtor's affairs. The debtor is bound, under penalty, to give *full information* about his affairs to the Official Receiver and the trustee in bankruptcy; he cannot, while he is a bankrupt, sit or vote i Parliament or act as a Justice of the Peace or i certain other offices. He will be committing a *offence* if he conceals any property or debt c falsifies his books of account, if he obtains propert on credit or secures credit of £10 or more withou disclosing his status, if he trades without suc disclosure or fails to keep proper books of accoun or if he leaves or attempts to leave the countr taking with him property, worth £20 or mor which ought to be divided among his creditor It is also an offence for him to transfer propert with intent to defraud any creditor, and any suc transaction may be set aside by the Court.

7. A Corporation or Incorporated Body is a association of persons recognised by *Act* *Parliament*, or by its *Charter*, as *one single leg* *entity*. It may be a *chartered* or a *statuto* *corporation* (*e.g.*, the British Broadcasting Corpora tion or the London Transport Executive), *local authority* (*e.g.*, the Greater London Council o the Westminster City Council), or a *compan* incorporated under the Companies Act, 1948, o one of the earlier Companies Acts. Generall speaking, a corporation of any kind has powe only to do such things as it is given power to d by its Charter or by the Act of Parliament unde which it was constituted; if it goes beyond tha power it is behaving *ultra vires* —"beyond it powers"—and such acts on its part will b regarded by the Courts as null and void. Th Court may also restrain the corporation b *injunction*—an Order forbidding it to act in suc a manner. (For *companies*, see final paragrap on this page).

Every corporation, being a single legal entit is a legal *person* distinct from the individuals wh are its members. Thus the *corporation itself* ca take *proceedings*, or have proceedings brough against it, in the Civil Courts, and it may itse be *prosecuted* in the Criminal Courts, if it commit an offence, and be liable to a fine. No persona liability rests upon its individual member directors, or officers unless they have personall done something unlawful or aided and abette the corporation in its wrongdoing. The corpora tion itself can *enter into a legal agreement* with on or more of its members or a member of the publi and any person injured by its acts can enfor his legal rights against the property or assets the corporation, which are distinct from th property or assets of the individuals who compos it.

A *company* is usually a commercial concern an generally takes advantage of the principle *limited liability*, in which case the last word i its name must be the word "Limited." Th principle is that, in the event of the company becoming *insolvent*, none of its members can b compelled to contribute to its funds a larger su than the sum which he agreed to pay for h *shares*, however large the indebtedness of th company itself. Every company must file at th Companies Registry a *Memorandum of Associ* *tion*, setting out its *name*, the situation of i *registered office*, its *objects* (beyond which it has n power to act), its *capital*, and whether or not it *limited*. It should also file its *Articles of Associ* *tion*, setting out its *rules of management*, th method of issuing, allotting, and transferring i *shares*, the procedure for *meetings*, the powers an duties of its *directors* and other officers, an similar matters. If and when its objects hav been *fully achieved*, or if it is desired to *disco* *tinue its activities*, or if it becomes *insolvent*, it w be *wound up* and *dissolved*. The winding-up undertaken by a *Liquidator* whose duties a similar to those of the trustee in bankrupt (described above under *Bankruptcy*). The liqui ator may be nominated by the members of th company or, in case of the company's insolvenc by some or all of the creditors, and the liquidator appointment must be confirmed at a spec meeting. If the winding-up of an insolvent co pany takes more than a year the liquidator mu report annually to the *Board of Trade*, th Government Department which watches th interests of the persons concerned.

. The CIVIL LAW or LAW OF PERSONS

is deals with the relations between *one*
idual citizen and another, and their mutual
s and duties. If A makes a business agree-
with B, and breaks it, or if A walks without
ission across B's field of new-mown hay, B
be able to secure *redress* against A by pro-
ings in a court of law. But in neither case
necessary for the State to intervene, by way
osecution, to punish A for what he has done,
no offence against society at large, and no
tion of public order, or the rule of law, has
n. The issue is one merely between A and B;
ay choose to ignore the wrong done to him,
may negotiate amicably with A for the pay-
of compensation or, if this fails, he may *as*
tiff sue A as defendant in a *civil action* for
ges. Unlike a criminal prosecution, under-
n by the State for the preservation of public
and vindication of the rule of law, with a
to punishing the offender, the *civil action*
be brought, if B so chooses, *by B himself* for
urpose of recovering *compensation* in money
ie harm he has suffered and (in some cases) of
ining an *injunction*—a Court Order prohibit-
A from continuing his wrongful conduct.
n, a criminal prosecution will not be dis-
nued even at the request of the injured party,
the State itself is interested to see justice
; but a *civil action* can be *discontinued* by B
hatever stage he desires, with or without an
ement for the payment of *damages* in com-
ation.

ese *relations between one individual and*
er, interference with which may give rise to a
action for damages or injunction, may arise
o alternative ways:—

1. from the acts of the parties themselves,

or

2. from the operation of law.

1. Law of Contract

e relations between individuals which arise
the acts of the parties themselves are usually
ght about by a *contract—i.e.*, by an agreement
een them. A contract may be (a) *expressed*
rds, as where A agrees to buy B's motor-car
400, on certain stated conditions, or (b)
ed by conduct, as where A calls a taxi and
the driver to take him to a certain address.
the former case, particularly if the contract
t into writing, the parties will normally have
ssed all the necessary terms and conditions.
the latter case it is *implied* by A's conduct,
understood by law and custom, that A will
pected to pay, at the end of the journey, the
nt of the fare recorded by the taximeter;
ot necessary for the driver to stipulate those
s in advance. Everybody, several times in
ourse of each day, enters into an *implied*
ct of this kind—when he steps on an omnibus
to his work, when he orders a meal in a
urant, when he tells the grocer to deliver
s to his house, and so on.

e Contracts and Deeds

A Simple Contract is a contract *expressed in*
(whether in writing or not) without the
alities of a *deed* (see below), or a contract
ed by conduct. There is no legal contract
nless there is *complete certainty* on the terms;
nless the basis of the agreement is lawful;
(*c*) unless both parties are *legally capable* of
ing into it (see above, *Status*), and (*d*) in
ete agreement on their intentions. And the
ment is not enforceable (*e*) unless there is
consideration, *i.e.*, some *quid pro quo*,
ssed or implied, on either side. (The Law
nission (D5–3), however, is considering the
ion of *consideration* as essential to every
act). Thus (*a*) a promise by A that he will
3's motor-car cannot be enforced by either
nless the price is mentioned, nor (*b*) if the
s been stolen by B, nor (*c*) if A is of unsound
nor (*d*) if B owns two cars, and A is thinking
e Ford, while B intends to sell the Austin.
Again (*e*) a promise by C, during the course of the year's work, that he will give his employee, D, a Christmas box of £5 is not enforceable by D unless *he* has made a promise, or done something in return. If C tells D that he will give D the £5 at Christmas *on condition that* D puts in certain *extra time* over and above his normal working-hours, and D complies or promises to comply, that compliance, or promise of compliance, will be sufficient *consideration* to turn A's promise into an enforceable contract. There need be nothing at all in writing, except in a few cases laid down by law; in all other cases the only *value of a written agreement*, signed by both parties, is that it provides clear *evidence* of the terms that were agreed. A written contract requires a sixpenny revenue stamp if it is to be produced as evidence in a court of law.

(2) **A Deed** (broadly speaking) is a contract or other written document, *signed*, *sealed*, and *delivered* by the parties. The formalities of *affixing one's seal* to a legal document, and pronouncing the formula, "I deliver this as my act and deed," have emphasised the significance and solemnity of certain important transactions for many centuries past; and even persons who were unable to write their names were capable of carrying out the formalities of *sealing* and *delivery*. The legal requirement that deeds should also be *signed* was imposed only in 1925, by section 73 (1) of the Law of Property Act. The chief practical distinction between a simple contract and a deed is that a *deed requires no consideration* to make it enforceable. The special formalities which constitute the *execution* of a deed (*i.e.*, signing, sealing, and delivery) take the place of that moral obligation which (in a simple contract) the common law required to be satisfied by consideration on the part of the person to whom the promise was made. For this reason a *deed* is required in a case where A makes a promise to B which he desires to render enforceable without any corresponding promise by B to A, and also in a case where A desires to make to B a *gift of property* of such a nature that it cannot be physically handed over. This second case arises particularly where the subject of the gift is *land or buildings*; in fact, by a provision of the Law of Property Act, 1925, a *deed* is always necessary to *transfer the ownership* of any *freehold or leasehold* property, and also to grant a *tenancy* for a term of *more than three years*. The transfer of a *legal right* of some kind (*e.g.*, a share in a company or the claim to moneys under an insurance policy) is generally effected *by deed*.

In connection with the Law of Contract the following subsidiary matters must be considered:—

Subsidiary Matters

(a) **Capacity of Parties.**—The question whether a party to a contract is *legally capable* of entering into it. This question usually depends on that party's *status* (see above):—

(1) *Nationality.*—Nothing turns on this, except that *no commercial contract* can be made with an *alien enemy* in time of war.

(2) *Domicil.*—Where the two or more parties to a contract have their *permanent homes in different countries* it is a wise precaution for them to state, in the contract, under which country's law and by which country's courts, in case of a dispute, its terms are to be construed. If they omit to do so, and some dispute is brought before the English Court, it will endeavour to decide, by considering the wording of the contract, the language in which it is written, the domicil of the parties, and the general circumstances in which the contract was made, what legal system the parties intended to apply and by what court they intended is to be judged. Sometimes it will decide the dispute according to the rules of the foreign law.

(3) *Marriage and Divorce.*—There is now no practical difference in contractual capacity between single persons, married persons, and divorcees.

(4) *Infancy.*—It is not (generally speaking) impossible for a person under twenty-one to enter into a valid contract, but he will be entitled to

repudiate it at any time up to his twenty-first birthday (or a reasonable period after that) *unless* the contract is (*a*) clearly for the *infant's benefit* on the whole (*e.g.*, professional articles or an agreement for apprenticeship), or (*b*) for the provision of *necessaries—i.e.*, food, drink, clothing, or services which are necessary to the infant in his particular station in life. (The origin of this latter rule is probably the practical consideration that, in earlier times, few people would have taken the risk of providing an infant, on credit, with the bare necessities of life if they had been precluded from suing him for reasonable payment.)

(5) *Lunacy.*—A party to a "contract" who knows that the other party is of unsound mind will not be permitted to hold the latter to his bargain. *See* D8(1).

(6) *Bankruptcy.*—A bankrupt cannot make a valid agreement to deal with his property in a manner which contravenes the law of Bankruptcy (see above, under *Status*, D8).

(7) *Corporations.*—Whether a corporation is capable of entering into a particular contract depends upon the legal powers conferred by the Charter or Act of Parliament under which it was constituted, or (if a company) by its Memorandum of Association (see above, *Status*, D8). If the matter to which the contract relates is of grave importance it will usually signify its adherence to the contract by *affixing its seal* with the formalities laid down by its Rules or Articles of Association. If it is an everyday or trivial matter the corporation will normally enter into a contract through some agent (*e.g.*, its Town Clerk, Director, or Secretary, as the case may be) who is empowered to sign or speak on its behalf (*see* Agency, D11).

(*b*) **When Writing is Necessary.**—There are certain exceptions, laid down by Act of Parliament, to the rule (*see* D9–2) that a contract is enforceable even if made only by word of mouth or implied by conduct. The Statute of Frauds, 1677, provides that contracts of these exceptional kinds cannot be enforced by action in the Courts "unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised"—these last words mean an *agent* (*see* Agency, D11). It is *not necessary* that the *whole of the agreement* shall be formally set down in *writing*; but there must be a *written and signed record* of all the *essential terms.*

(i) *A Guarantee.—I.e.*, a promise by A to B in the form—"Please lend money (or supply goods) to C, and if C does not pay you I will." A's promise by word of mouth cannot be enforced against him.

(ii) An *agreement* for the *sale or disposition of land* (*or buildings*) or of any interest in land (or buildings). We have already stated that the actual *transfer* of a *freehold or leasehold* interest must be effected by *deed* (*see* Deeds, **D9**). This is not the same as an *agreement to sell or dispose of* land or buildings; a *transfer* effects an *immediate change of ownership*, while an *agreement to sell* binds the party who signs it to make a transfer of ownership at some *future time.* Such an agreement need not be in the form of a deed, but its *essential terms* must be *in writing.*

(iii) An *agreement* which *cannot be carried out within one year* from the date when it was made, either because the actual carrying out of the transaction will take more than a year or because the agreement contemplates that more than a year is to elapse before the transaction is to be done. For example, A can make, by word of mouth, an agreement to employ B from month to month, or for not more than twelve months from the date of the agreement; but if he promises to employ B for three years, or for one year commencing in six months' time, B cannot enforce that promise unless the essential terms are in writing.

(iv) An *agreement in consideration of marriage.*—*e.g.*, a promise by A, to B, to give A's daughter, C, a certain dowry or income if B will marry her
(The words do *not* cover a *promise or agreement b*
B *to marry* C; the breaking of the latter agreemen
—"breach of promise of marriage"—can giv
rise to an action for damages, by C against B, even
if B has put nothing at all into writing.)

(v) By the Contracts of Employment Act, 196
(in force since July 1964), it is the *duty of an em*
ployer (not later than 13 weeks after the employ
ment commenced) to hand his employee a *writte*
statement of particulars of the employment (period
wage, working hours, and what length of notice i
required for termination).

(*c*) **Mistake.**—Suppose that John Brown want
his portrait painted by a famous artist called
William Brush, of whom he has heard but whom
he has never met. He looks up "William Brush"
in the directory and writes to him, at the addres
shown, offering him 100 guineas to paint th
portrait. Suppose that particular "Willian
Brush" is not the artist at all but a stockbroke
of the same name. Even if that William Brush
accepts Brown's offer, their apparent agreemen
will not constitute a valid contract, since Brown's
mistake as to Brush's identity is so *fundamenta*
that it *destroys the very basis* of the agreement
Where there is a mistake of this kind, "going t
the very root of the agreement," no valid contrac
has, in the eyes of the law, been made. In othe
special cases *equity* (*see* D4 2)) may, on the groun
of *conscience, relieve* one or both parties fron
liability under a concluded contract by *rectificatio*
(*i.e.*, by correcting the terms they have inadvert
ently recorded) or by *rescission* (*i.e.*, by cancella
tion of the contract). It is not every mistak
that will lead to these results; either the mistak
must have been *fundamental* or the circumstance
must have been such that it would be *uncon*
scientious for one party or the other to try to en
force his apparent rights.

(*d*) **Misrepresentation.**—Equity, on simila
grounds, will often relieve a party from liabilit
under a contract into which he has been induce
to enter through a *representation* by the othe
party which is *substantially false*—*i.e.*, a statemen
which is misleading on some essential point. I
it turns out that the *misrepresentation wa*
deliberate, the deceived party may in addition b
entitled to claim *damages for fraud.* Whether th
misrepresentation was *deliberate or innocent*, th
deceived party will usually be able to have th
contract *set aside*—*i.e.*, cancelled.

Suppose, for example, Jones wants to insure hi
life with the Markshire Insurance Compan
Before issuing the policy, which is the contrac
between them, the Company will ask Jones—
"Have you ever suffered from any serious illness?
Suppose Jones says "No," though he did in fac
suffer from tuberculosis five years ago. Even
the policy contains a promise by the Company t
pay Jones's widow £5000 upon Jones's death, th
Company will be entitled to refuse to pay whe
that event happens; it has been induced to ente
into the contract through Jones's misrepresenta
tion.

(*e*) **Duress** means compulsion by *threats or forc*
If a man has been compelled in this manner t
put his name to a contract it is *voidable by hi*
at any time—*i.e.*, *he may repudiate* it on the groun
of duress, and will be upheld by law in doing s
Undue influence means influence exerted by
upon B to such an extent that B could not hav
exercised any free and independent will in doing
particular act. Equity has always been jealou
to protect certain classes of persons from th
kind of influence; it goes so far as to *presume* th
there has been undue influence where a guardia
has got some benefit out of his ward, a paren
from his child who is under (or only just ove
twenty-one, a doctor from his patient, a solicit
from his client, or a priest from his parishione
In most of such cases the onus is upon the perso
in the influential position, who has obtained t
benefit, to prove that there was no undue influenc
it is not for the other person to prove that h
mind was wrongfully influenced by the former.

Illegality of contract arises where the parties agreed to do an act (i) forbidden by law or ontrary to "public policy." (i) The former ıdes not only an agreement to commit a e, but also an agreement to do an act which t be harmful to a third party and give him a of action for breach of contract or tort. courts will obviously not lend their assistance plaintiff who complains that the defendant efused to honour his agreement to do some- unlawful, whether (for example) the agree- t was to burgle a house or merely to write a ous article about another person. (ii) Even e act agreed upon was not actually unlawful, ourts will refuse to enforce the agreement if s to do something which is regarded as harm- o the community. It is not, for example, a e for a man and a woman to live together out being married, nor is it even "unlawful" e civil sense that such a way of life gives the a right of action against the other; but no would enforce an agreement by a woman to me a man's mistress, nor an agreement by nan to maintain her in return.

Breach of Contract occurs when one of the es breaks his promise and neglects or refuses rform his duty under the contract. Breach ne party entitles the other party to sue for *ges*, the amount of which is usually assessed to compensate the latter for the *actual loss* he suffered ("special damage"). In certain the court may award *general damages* in ion—*e.g.*, in an action for breach of promise arriage the jilted woman may be awarded *al damages* for the distress she has suffered, oss of reputation, etc., as well as *special ges* to cover the amount by which she is *f-pocket* by reason of giving up her employ- , buying a trousseau, etc.

Damages have always been the *common-law ly* for breach of contract. In special cases, ver, equity may grant two other remedies ldition to, or in substitution for, damages; only where equity regards damages as an icient compensation. These additional dies are:—

Specific Performance.—I.e., an order, to the in breach, *actually to carry out* what he acted to do. In practice this remedy is ned to: (i) contracts for the sale or letting *d or buildings*, and (ii) contracts for the sale me *article of a special nature* which cannot be ced by spending money in the open market example, the sale of an original painting by orandt. The remedy of *specific performance er* granted to enforce a contract for *personal es*, since it would be impossible for the court pervise the carrying out of such a contract.

Injunction.—I.e., an order by the court to arty in default *prohibiting him* from carrying ome positive act which would constitute a h of contract. For example, where a singer ntered into a contract to work, for a certain d, only under the management of one cular impresario and no other, the court may the singer not to offer or engage her services here during that period. Disobedience to junction constitutes *contempt of court*, and is hable by fine or imprisonment.

cy

The Status of an Agent.—An *agent* is a per- vho, being duly authorised, *acts on behalf of er person* who is called the *principal*. An is not the servant or employee of his princi- The principal tells his agent what trans- ns he wishes the agent to carry out, but does xercise the control and supervision that a r exercises over his servant. Thus, for ex- , a solicitor is the *agent* of the client who has cted him to attend to the purchase of a ; once instructions have been given it is the solicitor to carry out the work in his vay, as his skill and knowledge dictate. But olicitor's clerk is the solicitor's *servant*; he l what letters to write, what documents to prepare, what inquiries to make, and so forth. The two functions may sometimes appear to overlap; but the essence of agency is that there must be a *third party* with whom the principal is to be brought into relations; "the agent is the conduit-pipe connecting the principal and the third party." The agent is therefore debarred from acting for his *own benefit* without the principal's knowledge and consent.

Generally speaking, any person may do through an agent whatever he has power to do himself, except such transactions as depend upon some *personal qualification* peculiar to his own trade or profession. Thus, a man whose business is to sell or buy ordinary commercial articles can properly leave such business to an agent to perform; but an engineer, a lawyer, or a surgeon cannot entrust an agent with work that requires the exercise of *personal qualifications*, calling for special training and skill.

(2) **The Contract of Agency.**—Agency is brought about by *contract*—an agreement in writing, by word of mouth, or even one that may be implied from the conduct of the parties. No formal words are necessary: a request to an estate-agent to find a purchaser for your house will make him your agent for that purpose; if you ask a dealer to obtain for you a rare book or a Sheraton table, he is a purchasing agent on your behalf. The *terms* of the contract between the principal and the agent may be agreed upon in detail between them, or may depend upon the *usage* or general practice in the particular trade or profession. The parties are generally at liberty to agree upon whatever terms they please; in commercial agencies it is always desirable to set down in writing, for record purposes, the period for which the agency is to last, the area and scope of the agent's duties, his method of remuneration (usually by *commission*, at so much *per cent.* of the value of business he does), the prices at which he is empowered to sell or buy, and whether he is to be entitled to commission on sales to customers, or purchases from vendors, not introduced by him but carrying on business within his area.

In agencies of a special kind—where, for instance, a solicitor is instructed—his charges are regulated by a professional scale laid down by law; an estate-agent usually stipulates for payment of his commission on the recognised scale. Where no rate of remuneration has been agreed or implied, and after the work is done the parties cannot come to terms, the question must be decided by a court or arbitrator on the basis of *quantum meruit*—that is to say, an estimate of the *reasonable value* of his work.

(3) **Rights and Duties of Principal and Agent.**—These depend on the terms agreed between them; but if (as frequently happens) these terms are not on record, or are incomplete, certain legal principles apply. The first is that the relationship is one of *mutual trust*. The principal must do nothing to hinder the agent in earning his due; if he appoints a "sole agent," he must not entrust the transaction to other hands. If he does, he will have to pay the sole agent also. He must reimburse the agent for all expenses and losses properly incurred in doing what he was authorised to do. The agent must act honestly and loyally towards his principal; he must not make a secret commission or profit for himself, over and above what has been agreed; he must use proper skill and care, according to his qualifications, in his principal's business; he must keep proper accounts and pay over to his principal the money from time to time collected on the latter's behalf. If he has a *personal interest* in any transaction, he is bound to make *full disclosure*. The law will not tolerate any conduct which brings about a conflict between the agent's duty to his principal and his own *personal advantage*. The agent is therefore failing in his duty if, unknown to his principal, he buys the principal's property for himself, or sells his own property to the principal.

(4) **The Principal and Third Parties.**—So long as the agent has acted within the *scope* of his agency, the principal is bound by any authorised act done or agreement made between the agent and other parties. And even where the act was unauthorised, the principal is bound if he has, by words or conduct, led others to believe that the agent was authorised to do it. If the agent does something outside the scope of his agency—an act which no third party would reasonably expect the agent to have power to do—the principal is not legally bound towards the third party. These rules apply also to cases where the agent has received money or property from a third party on his principal's behalf, but fails to hand it over to him. The principal cannot claim payment over again from the third party unless the latter ought clearly to have known that the agent was not authorised to receive it. In other words, only contracts entered into and payments made by or to the agent in the *ordinary course of his business* are enforcable by and against the principal and third parties.

In cases of master and servant, similar rules apply where the servant, in the ordinary course of his business, injures some third party by a wrongful act; the servant is liable in damages, and the master also if the act (which turns out to be wrongful) was done within the *apparent scope* of the service. So, if one of the servant's ordinary duties is to deliver goods on his master's behalf by van, and while he is doing so he runs over a pedestrian through his own careless driving, the master as well as the servant will be liable to pay damages for the injury.

But the principal cannot be *prosecuted and punished*, by fine or imprisonment, for an agent's *crime* unless the principal himself authorised or took part in it.

(5) **The Agent and Third Parties.**—If the agent makes a contract *without disclosing* that he is merely *acting as agent*, he is *personally* liable to the other party to the contract, even though he intended to act on his principal's behalf. If he discloses that he is acting merely as an agent, but does not disclose his *principal's name*, he (the agent) will not usually be personally liable. If the contract is in writing, he can safeguard himself by signing it "as agent," "on account of," "on behalf of," or "for" a named person.

If, on the other hand, the agent gives a third party to understand that he is acting for a certain principal but has *in fact* no authority to act for him, and if the principal later refuses to accept liability, the agent is liable to the third party for his false statement or pretence. This is known as *breach of warranty*—that is, he "warranted" or guaranteed that he had authority to bind his principal, but has broken his warranty; having thus left the third party without right of redress against the principal, the agent must bear the liability himself.

2. Law of Tort

This branch of the law deals with the relations, between one individual citizen and another, which arise from the operation of the law itself, without the necessity for the parties to do any act to put them into legal relations with one another. As was pointed out above (**D9**(**1**)), if A and B are to be linked in a contractual relationship, each of them must take some step to bring that relationship about. No such step, however, is necessary in connection with the matters dealt with by the Law of Tort. Everybody has a right to expect that his person and his property shall be inviolable by other private citizens; he also has a right to expect others to refrain from attacks upon his character and his business reputation. These rights do not arise from any agreement or other act on his part, but from the general principles of the law.

A *tort* is the violation of such a right, which entitles the injured party to bring a *civil action* for
damages to *compensate* for the injury he h
suffered. The word *tort* (in French "wrong
is derived from the Latin *tortus* meaning "twisted
or "distorted."

It will be seen from the Table (**D3**) that son
torts (*e.g.*, assault) may also be crimes—that i
they may entitle the injured party *either* to bri
a *civil action* for *damages* or to *prosecute* the offen
ing party and have him *punished* by a *crimin*
court in cases where the offending party's acti
is liable to harm the community at large;
personal assault, for example, may lead in som
circumstances to general disorder, and in th
event it will become a matter for intervention
the State through the criminal courts (*see* **D3**
36). This section, however, deals only with th
civil remedies which, as in breaches of contra
are primarily *damages* and sometimes *injuncti*
(*see* **D11**(**1**)).

The main headings under which torts may
committed are shown in the Table.

Trespass is a wrongful act committed by o
citizen, against the will of another citizen, eith
against the latter's person or in disturbance of h
possession of land or other property.

(1) **Trespass against the Person** may be by wa
of *assault, battery,* or *false imprisonment.* A
assault is an attempt to do violence to the perso
of another; if the act is fully consummated
becomes a *battery.* Thus it is an *assault* for o
man to shake his fist in the face of another, or
adopt a threatening attitude towards another,
deliberately to set his dog on another person.
the first person actually strikes the other perso
or if the dog, encouraged by the first perso
actually bites or harms the other person, that is
battery. In order to constitute an assault
battery, and to render the trespasser liable to a
action for damages, his act must be *deliberate.*
is not assault and battery if A *accidentally* knoc
against B in a crowd, with the result that B fal
and is injured. The act by the trespasser mu
also be *against the will* of the person injured. Th
an operation performed by a surgeon, though
may seriously affect the body of the other perso
is not an assault or battery if the other person h
consented to the operation; but such an operatio
performed without the other person's consen
may amount to an assault or battery.

Certain acts which would in the ordinary wa
constitute assault or battery are excusable; it
recognised, for example, by the common law, th
a parent or a teacher has the right to infli
reasonable chastisement upon a child or pupil
his care, and provided that the chastisement is n
excessive the child or pupil has no right of actio
If, however, the chastisement results in serio
injury or amounts to brutal violence, then t
person inflicting it will be liable to an action f
damages.

False imprisonment means the *unlawful restrai*
of one person by another. It need not amount
actually locking up a person in a room; it
sufficient if his freedom of movement is *total*
restrained either by confinement or by the use
force or threat of force. It should be noted th
the restraint must be unlawful; it is not, f
example, unlawful for a police officer to arrest
person engaged in committing a crime, or a pers
whom the officer has reasonable grounds f
suspecting of committing, or being about
commit, a violent crime. Even a private citiz
may lawfully arrest a person who has actua
committed a violent crime or whose behaviour h
led to a breach of the peace (*see* **D41–2**).

The tort of *malicious prosecution* is committ
by a person who makes a *criminal charge* again
another person where the proceedings termina
in the acquittal of the latter, where the fi
person was actuated by spite or ill-will, where the
was no reasonable or proper cause for the p
ceedings, and where the second person h
suffered damage as a result. The essence of t
tort is *malice* on the part of the person w

ght the criminal charge; it is not sufficient he was honestly mistaken.

Trespass to Land arises whenever one person *unlawfully* upon land or a building in the ssion of another person. Two important s should be noted, as several popular fallacies about this tort. First, trespass to land is not ordinary case a crime, unless there is some f Parliament which makes the trespass a nal offence (for example, under certain es it is a criminal offence for an unauthorised n to cross a railway-line or to enter a Govern- airfield from which considerations of ty require unauthorised persons to be led). Secondly, it is not necessary, to tute a trespass, that *actual damage* should be to the land or building on which the tres- has set foot. The essence of the tort is erence with the possession of the other party, his may arise by merely walking across his or throwing refuse upon it, or placing or ng anything on the land without the other s consent; any act of *physical interference* s.

Nuisance.—The *tort of nuisance* arises when cupier of land or premises does something which substantially interferes with the en- nt by a neighbouring occupier of his land or es. In *trespass* (see above) the interference e *physical*; this is not so in cases of nuisance. ample, it is a nuisance if A allows his factory ey to emit volumes of thick smoke which continually into B's house or garden, or for arry on, in a building belonging to him, a or process which causes noxious smells or ing vibrations liable to interfere with B's nent of his property. It is not, however, such act that gives rise to an action for ce; there must be a certain amount of and take," particularly in urban areas, but must not use their premises in an un- able or wilfully annoying manner. Thus been held that a teacher of music who had singing in her house for several hours a nd on several days a week, which caused erable disturbance to the person next door, t committing a nuisance, since it was not onable for her to use her house in this r. On the other hand, when the person oor retaliated by clashing domestic imple- and deliberately making as much noise as e while the lessons were going on, he was have committed a nuisance because his t was unreasonable and wilfully annoying. ery case depends upon its own special facts. ding contractor who keeps a pneumatic ing outside a private house, in connection uilding operations, is not liable to an action sance, provided that the use of the drill is ry to the work, that it is confined to ble working hours and limited to a tem- period; but if the owner of a motor-cycle keep its engine running, merely to demon- ts power, outside his own garage for several a day, and on several days a week, his urs could claim that that was (in law) a e.

the above examples may be classed as *nuisances*, and they are torts but not There is, however, another class, known *c nuisances*, which become criminal offences are liable to injure the public in general. es of these are leaving an unlighted tion on a public road, blocking a public h, or allowing a building to get into such a disrepair that it causes a danger to users ublic highway. In such cases the person the public nuisance may be prosecuted nished and, moreover, any individual injured by such conduct may have a right a civil action for damages.

respass to Goods is an unlawful disturbance B's lawful possession of his goods. Such disturbance may arise by seizure or removal of the goods without the owner's consent or by conduct causing damage to the goods. It follows that every theft of goods is also a trespass; but for the preservation of public morality it is laid down that, if there is a criminal element in the conduct of the wrongdoer which makes his trespass theft, the injured party cannot bring a civil action for damages unless the thief has first been prosecuted in a criminal court.

The *tort of detinue* consists in the wrongful detention by one person of another's goods and his failure or refusal to deliver them up when demanded.

The *tort of conversion* or *trover* arises when A wrongfully appropriates the goods of B to his own use or to the use of another person, depriving the owner of them permanently or for a substantial time, or destroying them. These torts of *detinue* and *conversion* can be committed only against goods or articles of property; they cannot arise from interference with fixtures permanently attached to a building, growing crops or trees; but these torts may be committed if, after such things have been removed or cut down, the wrongdoer detains or converts them to his own use.

(5) **Negligence** in law has a very specialised meaning; it is not "neglect" or "carelessness" in the ordinary sense, but failure to take such care as the circumstances of the particular case demand. In the *tort of negligence* there are two essential elements—first, a *legal duty* to exercise proper care and, secondly, a *failure* to take such care. No action for negligence can be brought by A against B, even if B has been grossly careless, unless the relations between the parties were such that B was under that legal duty towards A. Moreover, the *degree of care* which A is entitled to expect from B will vary according to the nature of those relations.

One obvious example where the legal duty of care arises is among persons using the roads. All of us have the right to use the roads for the purpose of travelling, on foot or in some vehicle, and the manner in which each of us exercises that right will obviously affect the safety and comfort of other road-users. There is therefore a *legal duty of care* upon every road-user (under the common law, and quite apart from the provisions of Acts of Parliament relating to motor-cars) to exercise his right to walk or drive with due regard to the similar rights of other road-users. And, equally obviously, the *standard or degree of care* which it is reasonable to expect from the driver of a powerful car is higher than that which is expected from a pedestrian, since the amount of damage which will be caused by carelessness on the part of the driver is very much greater than that which the pedestrian is capable of inflicting.

We are *not* here referring to *offences* under the Road Traffic Acts, for which drivers or pedestrians may be *prosecuted and punished* under the *criminal law*. Careless or reckless driving or walking may be a criminal offence under those Acts, even if it has caused no injury to any person or property. In cases where such injury *has* been caused the *test* to be applied, in determining whether the injured person can *sue and recover damages* against the other party, is whether that other party has fallen short of the *standard of care* reasonably to be expected from him. It is true that disobedience to a provision of the Road Traffic Acts, or neglect of the Highway Code, may constitute *evidence* helping to prove that the latter party was lacking in the proper standard of care required of him; but there may be other circumstances which show that he was *negligent* in law, and liable to an action by the injured party for *damages*, even though he committed *no criminal offence*.

There are many other relationships where the *duty to take care* arises. One of these is the relation between *the occupier of premises* and persons *coming on to the premises*, whether they have a right to be there or not. Towards *trespassers* (see above) the duty of the occupier is merely a negative one—he must not "set a trap"—*i.e.*, he must not deliberately do anything calculated to cause injury, nor must he do any act which, if done carelessly, is reasonably likely to cause injury. If he knows a trespasser is on the premises he must *warn* him before he *does any dangerous act*; the fact that the trespasser has no lawful right to be there does not entitle the occupier (for example) to weaken the supports of a bridge or set off an explosion without warning. If the occupier does so, he will be liable to be sued for damages, in an action for negligence, even by a trespasser who is injured as a result.

The other rules, relating to the duty of care owed by an occupier to persons coming on to his premises, have been modified (as from January 1st, 1958) by the Occupiers' Liability Act, 1957.

The occupier's duty towards a *trespasser* remains *unchanged*. The Act, however, abolishes the former distinction between an *invitee* and a *licensee*, both of whom it describes by the new term, *visitor*. The principal rules are:—

1. The occupier owes the *same duty* ("the common duty of care") *to all his visitors*, except in so far as he is free to, and does, extend, restrict, modify, or exclude his duty, to any visitor, by agreement or otherwise.

2. The "common duty of care" means a duty to take such care as in all the circumstances is *reasonable*, to see that the visitor will be *reasonably safe* in using the premises for the purpose for which he is invited or permitted to be there.

There are *subsidiary rules*—*e.g.*, that an occupier must expect *children* to be *less careful than adults*, and that a person "in the exercise of his calling" (*e.g.*, a window-cleaner) can be expected to appreciate and guard against special risks incidental to that calling. And a *landlord* of premises, if he is under a *legal obligation towards his tenant* to keep the premises in repair, is to owe *to visitors the same duty* as if the landlord were the occupier, so far as concerns dangers arising from his default in carrying out that obligation. One of the matters considered by the Law Commission (D5–3) is the creation of a right of redress, for purchasers and visitors injured by defects in a building, against vendors and landlords.

Among the classes of persons upon whom the law imposes a *duty to take care* are those who practise a *profession or calling* which, from its nature, demands some special skill, ability, and experience. A man who is advised or treated by a physician, surgeon, or dentist, or who consults a lawyer or an architect, is entitled to expect him both to possess and to exercise a reasonable degree of such skill, ability, and experience. If the professional man falls short of the *proper standard*, the patient or client may bring against him an action for damages on account of his negligence. But a mere error of judgment on a difficult point does not amount to negligence, provided that the professional man possesses the proper standard of knowledge and skill and has used them carefully and conscientiously to the best of his ability. And he is not liable, by virtue of his professional status, to an action of negligence for something he has done while acting otherwise than in his professional capacity—*e.g.*, a solicitor who is asked to express an opinion on the value of a house (which is no part of his professional duty). (But a barrister cannot be sued for negligence in the conduct of a case in court.)

(6) **Defamation.**—The tort of *defamation* committed by a person who *attacks the reputati* of another by "publishing" a *false and defamato* statement concerning him to a third party. the defamatory statement is *in writing* or so other *permanent* form (*e.g.*, a picture, a film, o gramophone record), then the action will be *libel.* If the defamatory statement is in *spok words* or some other *non-permanent* form (*e.g.*, signs or gestures) it will be *slander.*

Another important distinction must be observ at the outset. In cases of *libel* the person who reputation has been attacked may sue for damag *without proof of "special damage"*—*i.e.*, pro that he has *suffered actual harm* from the libello statement; while in *slander no action* can normal be brought *unless special damage* can be prove There are, however, five exceptional cases whe such proof is unnecessary, *viz.*, in slanders:—

(*a*) *disparaging* a person in the way of *business, profession,* or *office of profit* (*e.* saying of a doctor that "he is ignorant of t first principles of medicine");

(*b*) imputing *dishonesty* to a person holdi an *office of honour* (*e.g.*, saying of a Councill that "he gives contracts to his friends");

(*c*) imputing that a person has committ a *crime punishable by imprisonment* (*e.* saying of a man "he is no better than thief");

(*d*) imputing that a person is sufferi from a *contagious disease* of a disgraceful ki (especially a venereal disease);

(*e*) imputing *unchastity* to a *woman girl.*

In these five cases "publication" of the sland alone is sufficient to give rise to an action, witho proof of special damage; for slanders of oth kinds no action can be brought unless spec damage can be proved.

Note also that no action can succeed, either libel or slander, unless the statement complain of is (1) *false*, and (2) *defamatory* and unless there has been *publication* to a *third par* (1) The statement must be false "in substan and in fact"; if it is substantially true the pers complaining has suffered no injury, recognised law, to his right (*see* D12 1)) to the inviolacy his reputation. (2) The statement must *defamatory*—*i.e.*, it must be one which "tends lower him in the estimation of right-thinki members of the community," or which is "ca culated to expose him to hatred, ridicule, contempt." (3) *Publication*, in this conte means simply *making known* the defamato statement to at least one *third party*. If t defamatory statement is conveyed *only to person defamed*, and to no one else, there is "publication," and the person defamed has *civil remedy.*

In one exceptional case—where a defamato statement, *in writing*, is likely to lead to a *brea of the peace*—the person making it may be *prosecut* for the offence of *criminal libel*, for the purpose n of compensating the injured party, but of u holding law and order (*see* D6 1)). In t exceptional case the *truth* of the statement (s above) is *no defence*, and *publication* to a th party is not necessary to secure a convicti But there is no such offence as "criminal slande

If a defamatory statement is made reflecti on a *class of persons* generally (*e.g.*, an attack "Methodists" or "coloured people" or "mone lenders") that will not entitle a person w happens to belong to that class to bring an acti unless he can show that *he personally* was aim at and defamed. The family of a *deceased pers*

t bring an action for a libel or slander upon
putation of the deceased.

liament has, however, passed new legislation
against racial propaganda or discrimination
lly (the Race Relations Act, 1965).

he person sued puts forward the defence
he words he used were "not published of
oncerning" the person bringing the action,
uestion must be decided whether those to
the statement was published could *reason-*
nderstand it to refer to him. If such under-
ing is reasonable, then it is no defence for
rson who made the statement to show that
not in fact intend to refer to the other person,
en that the latter's existence was unknown
n.

ne statements are defamatory in their
l and primary sense (*e.g.*, "John Brief is a
ughly dishonest lawyer"); others may
r unexceptionable if looked at literally, but
have a defamatory meaning in a particular
xt, or in particular circumstances known to
ersons to whom they are published (*e.g.*, "I
Irs. B has left her doctor a lot of money. A
nd of doctor *he* is!"). In cases of the latter
the person who claims that the published
are defamatory of him must plead an *in-*
o—*i.e.*, he must set out, in his statement of
the meaning in which he alleges the words
ained of were used. It will be the duty of
dge to decide, as a matter of *law*, whether
ords are *capable* of bearing that meaning;
ry will have to decide, as a question of *fact*,
er the words complained of did actually
y that meaning to those who heard or read

re are several recognised defences to an
of libel or slander:—

Justification.—A plea that the words com-
d of were *substantially true.* Once the words
been shown to be defamatory, it is for the
who used them to prove their truth—not
party injured to prove them false.

Absolute Privilege.—By common law, or by
Parliament, defamatory words used on
particular occasions, though published to
parties, cannot give rise to any right of ac-
The occasion is "absolutely privileged."
ty to any *legal proceedings*, nor any witness,
l, or member of the jury, nor of course the
can be called upon to answer for any words
used *during the proceedings*, however spite-
d however harmful they may have been to
putation of any other person. The rule
to *pleadings* (*i.e.*, allegations in writing,
the court) as well as to statements made
t by word of mouth.

lar protection applies to words spoken *in*
ment by a member of either House (though
spoken outside either House are not pro-
. And under the Parliamentary Papers
840, those who publish (in the ordinary
f the word) the proceedings of either House,
authority, are protected in the same way;
official communications, on *affairs of State*,
by a minister to the Monarch, or by one
of State to another in the course of his
duty. To all these *absolute privilege*
.

ualified Privilege.—Apart from the cases
entioned, there are other *occasions* which
vileged, not absolutely, but in a *qualified*
The *nature of the qualification* will be
ed below; meanwhile it may be said that
leged occasion of this latter kind arises
er the person making a communication has an *interest*, or a legal, social, or moral *duty to make it*, and the person to whom it is made has a corresponding interest or duty to *receive it.* A common example is a reference given, about the character of a servant, by a former to a prospective employer; another is a report made, on the commercial credit of a trader, by one person who has dealt with him to another who intends to do so. Other occasions of *qualified privilege* are *reports* of *judicial proceedings*, of *public meetings*, and of the *proceedings* of municipal or other *public bodies*.

Such occasions are *privileged* to this extent and with this qualification—that there was no *malice* (*i.e.*, spite or other *improper motive*) in the mind of the person when he made the communication. If there was malice, then the fact that the occasion was one of qualified privilege will not protect him from an action for damages at the suit of the person defamed. In any such action it is the duty of the judge to decide, as a question of *law*, whether the occasion was one of qualified privilege; it is for the jury to decide, as a matter of *fact*, whether the defendant was malicious in what he wrote or spoke. (Contrast occasions of *absolute privilege*, where the presence or absence of *malice is immaterial.*)

(4) *Fair Comment* "on a matter of public interest."—This form of defence is most commonly employed by newspapermen, reviewers, and critics. If this defence is to succeed, the words to which it relates must be really *comment* (*i.e.*, expressions of opinion, not statements of fact): the comment must be concerned with *a matter of public interest* (*e.g.*, a book, a play, a musical performance, a political speech, or the public actions of men in the public eye—but not their private lives). Lastly, the comment must be *fair*—and it cannot be fair if it is actuated by *malice* in the mind of the commentator. If he has mingled with his comment some statement of *fact*, and that statement is inaccurate or misleading, that in itself will prevent the comment from being regarded as fair. The *onus is on the defendant* who is pleading fair comment to establish that what he is seeking to defend is really *comment*, that the matter on which he commented was one of *public interest* (not, for example, private scandal), and that the comment is *not based on any misstatement* of facts or *otherwise unfair.* Dishonest or insincere comment cannot be fair; but, on the other hand, an honest belief in the commentator's mind that his comment was fair is not enough for a successful defence. The comment must be fair *in fact.*

The usual *remedy* in actions of *libel* and *slander* is damages—a sum of money sufficient (in the jury's view) to compensate a man for the harm his reputation has suffered. In certain rare cases the Court may, in its discretion, grant an *injunction* ordering the defendant not to publish or not to repeat the publication of a libel.

The Defamation Act, 1952, reduces the risk of legal proceedings against anyone who *innocently* "published" a libel. The "publisher" may make an *offer of amends*, *i.e.*, an offer to "publish" a *correction and apology*, and to take practicable steps to *notify* those who have received copies of any defamatory document. (*a*) If the offer is *accepted* and the promise performed, the party defamed cannot bring, or continue, an action for libel or slander. (*b*) If the offer is *rejected*, then the "publisher," in any action taken against him, may plead, *in defence*, that the words were "published" innocently, and that the offer of amends was made as soon as practicable. *Innocent* publication means: (1) that the "publisher" did not intend the defamatory words to refer to the other party, and knew of no reason why they might be understood to refer to him; or (2) that the words were not in themselves defamatory, and that the "publisher" knew of no reason why they might be understood to defame the other party; also that, in either case, the "publisher" exercised all reasonable care in regard to the "publication."

V. THE LAW OF PROPERTY

I. In General

(1) **Living Persons.**—The special rights and disabilities which affect the ownership and disposal of property by certain classes of persons have been already dealt with under the heading of *Status* (D7 8). It is unnecessary to add anything here on the law of property *in general*, so far as living persons are concerned; but different rules are applicable (as will be seen below) to the ownership and disposal of *land and buildings* as compared with *property of other kinds*. The reason for this main distinction is that the former are, in their nature, *immoveable* and *cannot be physically transferred*, as can money and "chattels" (*i.e.*, animals and *tangible objects* which are capable of being owned). In addition, there is a third class—certain *intangible things* which can be owned and dealt with—for example, the right to be paid a debt, a share or stock in a company, an insurance policy, or a patent; these are known as *things in action*, and they can be transferred only in certain formal ways, which will be described below.

(2) **Deceased Persons.**—It is obvious that the law of any civilised community must make provision, not only for the *transfer by a living person of his property*, but also for the *transmission of that property (his "estate") upon his death.* English Law permits every person who is *not disqualified by infancy or lunacy* (*see* **D7**) to *give directions, during his lifetime, as to the disposal of his estate upon his death*; he can do this by means of a *will.* If he leaves *no valid will* he is said to die *intestate*, and in that event *the law itself* lays down how his estate is to be distributed. A concise survey of the law governing the estates of deceased persons is given below. (Some of these rules have been modified, so far as *domicil* is concerned, by the Wills Act, 1963.)

Wills and Intestacies.—The law of wills is highly technical; much trouble can be caused by a "home-made" will, and it is wise to seek a solicitor's advice. It is only possible here to outline the *formalities* necessary to make a valid will, and the *procedure* to be adopted after a death. The rules stated are those under English law—applicable to England and Wales, but not Scotland or Northern Ireland.

(1) **The Nature of a Will.**—The person making a will—the *testator*—sets down how he wishes his property to be disposed of after his death, and states the names of the persons (the *executors*) who are to attend to its disposal.

The executors may be, but need not be, some or all of the persons whom the testator desires to benefit under his will. One executor alone is sufficient in law; but if that one dies before he (or she) has completed his duties, delay and difficulty may arise. It is therefore better to appoint *at least two* executors; if one dies, the other has full powers to continue the work. If the testator's *estate* (that is, his property) is large, it may be best to appoint a bank as executor; all banks have trustee departments which are experienced in such matters. They have scales of charges for executorship work, which will be supplied on request. An executor is not permitted to charge for his work, unless the will authorises him to do so—a thoughtful provision for a complicated estate. Nor is the executor bound to accept the executorship when the death occurs.

A will "speaks from death"—that is, it has no legal effect until the testator dies; it can be *revoked* (that is, cancelled) in various ways, or alterations can be made by *codicil*, which is really a supplementary will. Further, the property to which it relates is that of the testator *at the date of his death*, which may be more or less than what he owns at the date when the will is made. The will can be revoked or varied as often as desired to suit changing circumstances; its provisions are not final until death.

Generally speaking, a testator may make whatever provisions, in regard to his or her property and the persons to be benefited, he or she thin
fit. He or she may even direct that his or h
wife, husband, or children are to be deprived
all benefit from the estate; but, if he or she do
so, it will be well to give the reasons, either in t
will itself, or in a signed, witnessed, and dat
document, which should be left with the will.

Under Acts of 1938, 1952 and 1965 (*see* **D32**(2
a husband or wife, an unmarried daughter or s
under twenty-one, or a son or daughter "und
disability" (that is, one who for some reason
incapable of looking after himself or herself), w
is not adequately provided for under the will, m
apply to the Court for "reasonable provision f
maintenance" out of the estate; the Court h
power either to refuse the application or to gra
the applicant whatever maintenance it thinks f
In making its decision the Court will take note
the testator's reasons for his failure to provide f
the applicant in question. (*See also* **D32**(2) rela
ing to former husbands and wives).

If a person dies without leaving a valid will,
is said to die *intestate*. In that case somebo
(usually the husband or wife or next of kin) mu
apply to the Probate Registry (at Somerset Hou
in London or in the nearest District Regist
elsewhere) to be appointed *administrator*.
administrator has the same rights and duties as
executor. If there are children under twenty-o
and in certain other cases, there must be at lea
two administrators, and the procedure on dea
is more involved and troublesome than whe
executors have been appointed by will. Furthe
as the testator has not directed what is to happ
to his property, the law has laid down an *order*
succession, which the administrators must obser
The intestate's husband or wife is then entitl
first to the *personal effects* (furniture, househo
goods, motor-cars, books, etc.); next, to t
whole of the estate, if there are no children
near relatives, or £5,000 if there are, and, aft
that, the husband or wife and children have certa
rights in the remainder of the estate, if an
details of which can be found in the Intestat
Estates Act, 1952. If there is no husband or wi
or no children, or neither, the next of kin of t
intestate will benefit in order of nearness of their
lationship to the deceased.

It is always prudent to make a will, howev
simple, since by doing so the testator exerci
control over the disposal of his property and sav
considerable trouble for his family.

(2) **The Execution of a Will.**—The formalit
must be strictly observed, except in the case
soldiers, sailors, and airmen on active service (
cluding members of the Women's Services a
nurses), for whom informal directions, even i
letter or by word of mouth, are sufficient. For
other testators, inattention to the formalities m
render the will invalid, and will in any case ca
considerable trouble and expense.

The will must be *in writing—i.e.*, not
word of mouth—handwritten, typewritten,
printed, but the wording need not be in legal
formal language, so long as it clearly identifies
testator, the executors, the various kinds of p
perty dealt with, and the persons to be benefit
It should also state that the following formalit
have been carried out when it was executed—t
is, signed by the testator and *attested—i.e.*, w
nessed by two competent persons:

(a) *The will must be signed* by the testator,
by some other person in his presence and by
direction. If the testator can write, his *us*
signature will suffice; if he is illiterate or
unwell to sign in full, he may make his "mar
or his initials alone. If he is incapable of hold
a pen, someone else may sign for the testat
provided he is present at the time and author
the signature. If the testator is blind or oth
wise incapable of reading the will, it should
read over to him before his signature or mark
placed on it, and the fact of his blindness sho
be mentioned in the final clause.

(b) *The signature or mark must be at the foot*
end of the will. This means (i) nothing ad

the testator's signature, and (ii) nothing en anywhere on the document *after the testator lf has finished signing*, will be valid, except gnatures, addresses, and descriptions of the sses. If, therefore, at the last minute the or desires some addition, alteration, or deleo be made, he and the same witnesses must or put their initials against the addition, tion, or deletion, which otherwise will be ed.

The testator's signature must be made or (if nnot sign) acknowledged *in the presence of itnesses*, who must both be *present at the same* Any persons may be witnesses, so long as are capable of understanding what is going They need not read the will or know its nts; but if either of them is a *person who is e a benefit* under the will, or the husband or f such a person, he or she will *lose that benefit*. therefore safest to call in witnesses who are gers to the testator. Both witnesses must *esent together* when the testator signs (or owledges) his signature; it will not be a valid ation if first one witness, and then the other, led into the room. (The wife or husband of eficiary must not be a witness.)

The witnesses must sign the will *in the preof the testator*. Either witness may, if necessign by mark or initial, but no other person sign on his behalf. For identification purit is usual and desirable for the witnesses to heir addresses and occupations, in case of a quent dispute which may necessitate their found to give evidence.

he will consists of several pages, they should stened together before execution, and the tures of the testator and witnesses should r at the end of every page, not to satisfy les set out above, but as evidence that every formed part of the will when it was executed.

is desirable (though not legally essential) the will should bear, just above the signaof the witnesses, an *attestation clause*—that ormal statement that these formalities have carried out. The usual wording of this clause e found in the example shown below.

these rules apply in exactly the same way *odicil*.

The Contents of a Will.—The opening words d clearly identify the testator by his full s, occupation or description, present address f possible) other recent addresses, and declare his is his *Last Will*. It is sometimes found ath that a testator has a banking account or s and shares registered in his name at some ddress, and in such cases the bank or comconcerned, wishing to be sure that his iden- clear, may insist upon a sworn statement to fect that he is the same person as the person knew as customer or shareholder. (See the ple below.)

xt follows the *revocation clause*—a declaration the will now being made *revokes* (that is, ls) all previous wills and codicils. If this is serted, doubts may arise after death as to er the new provisions are intended to be tuted for, or merely to supplement, proviin an older will. If it is intended that the will is to remain valid in part, that should be y stated. If the document now being exeis a *codicil*, it should be described as such, he date of the original will to which it is a l should be mentioned, and also which parts original will are being *confirmed*, to stand and which *revoked*.

next clause should appoint the executors, must be identified by their full names and ptions or addresses. "My brother John," son Charles," or "my mother" will suffice, only one person could possibly answer to f these descriptions; but "my wife" is ough without giving her names in full, since s not follow that the person who is the testavife at the time of his death was necessarily fe when the will was made.

Next follow the directions for disposal of the testator's property. *Bequests or legacies* of particular articles ("my pearl necklace," "my oak bedroom suite") or of particular investments ("my 3% War Stock")—these are *specific legacies*—must clearly identify exactly what is being bequeathed. In the case of land or a house, the full description should be given—"my leasehold house and grounds at 31, Acacia Road, Redhill in the County of Surrey," or "my freehold farm known as 'Newlands' at Northgate in the County of Derby." The words "I devise" are the technical words appropriate to freeholds: "I bequeath" to all other kinds of property: the effect is the same. (Bequests or legacies of *sums of money*—*pecuniary legacies*—should preferably be stated in words rather than figures; if figures are used the accidental omission of a nought may be disastrous.)

Finally, there is the clause that deals with the *residue* of the Estate—that is to say, whatever will remain after the executors have paid the funeral expenses, death duties (if any), legal and other fees, the testator's debts, and the pecuniary legacies he has bequeathed, and after the specific bequests have been handed over to those entitled. Such a clause is necessary because no testator can be sure, when he makes his will, that he has disposed exactly of everything of which he may die possessed, or that all the persons to whom he has made bequests will necessarily be alive, when he dies. In general, the death of such a person—a *legatee*—before the testator causes that person's legacy to *lapse*; but if there is a bequest of the *residue* for division among a number of persons, no harm is done: the *lapsed legacy*, being left over and undisposed of, leaves the residue to be divided among the surviving *residuary legatees*. The expression "such of the following persons who may survive me" may be properly used.

(4) Revocation and Revival.—A will or codicil may be *revoked* (*i.e.*, cancelled) by "burning, tearing, or otherwise destroying" it with the intention of revoking. Destruction by accident, or without the testator's desire to revoke it, is ineffective, and if a copy exists, its provisions may be put forward as still valid. The revocation clause in a later will (see above) will be equally effective to revoke an earlier will; or some part of the earlier will may be revoked by a later codicil clearly referring to that part.

A will is also *revoked*—generally speaking—by *subsequent marriage*, since the law assumes that, if the testator who is newly married had had time for or given thought to the matter, he would have altered his will. If he did not do so after marriage, he will die intestate.

If a testator makes *Will A*, and later on *Will B* containing a revocation clause, Will A is revoked —*i.e.*, cancelled. But if *Will B* is in turn revoked by *Will C*, that does *not revive*—*i.e.*, revalidate—*Will A*, unless *Will C* says, in so many words, that "*Will A* is hereby revived."

SPECIMEN WILL

I JOHN SMITH of 31 Acacia Road Redhill in the County of Surrey Company Director[1] HEREBY REVOKE[2] all wills and testamentary documents[3] heretofore made by me AND DECLARE this to be my LAST WILL.

1. I APPOINT my wife JANE SMITH[4] and my Solicitor EDWARD JONES to be jointly the Executors of this my Will.

2. I DEVISE my freehold farm known as "Newlands" situate at Northgate in the County of Derby unto my son JAMES SMITH in fee simple.[5]

3. I BEQUEATH the following specific legacies:[6]

(1) To my son THOMAS SMITH any motor-car of which I may be the owner [7] at the date of my death.

(2) To my said son JAMES SMITH all my shares in the Company known as John Smith & Sons Limited.

(3) To my said wife all my personal chattels [8] not hereby or by any codicil hereto otherwise bequeathed [9] for her own absolute use and benefit.[10]

4. I BEQUEATH the following pecuniary[11] legacies:

(1) To my daughter JULIA SMITH the sum of TWO THOUSAND POUNDS.

(2) To my secretary EVELYN ROBINSON the sum of ONE HUNDRED POUNDS.

5. I DEVISE AND BEQUEATH all the residue [12] of my real and personal estate whatsoever and wheresoever not hereby or by any codicil hereto otherwise expressly disposed of as to my freeholds in fee simple [5] and as to my personal estate absolutely unto my said wife JANE SMITH for her own absolute use and benefit.[10]

6. I DIRECT that any executor of this my Will being a Solicitor or a person engaged in any profession or business may be so employed and act and shall be entitled to make all proper professional charges [13] for any work done by him or his firm in connection with my Estate including work which an executor not being a Solicitor or a person engaged as aforesaid could have done personally.

IN WITNESS whereof I the said JOHN SMITH the Testator have to this my LAST WILL set my hand this twelfth day of April One Thousand Nine Hundred and Sixty-Five.

[4] SIGNED AND ACKNOWLEDGED by the above-named JOHN SMITH the Testator as and for his LAST WILL in the presence of us both present at the same time who at his request in his presence and in the presence of each other have hereunto subscribed our names as witnesses:

John Smith

George Matthews,
6, Elm Road,
Redhill, Surrey.
Chauffeur.

Ida Gray,
10, Oaktree Road,
Redhill, Surrey.
Children's Nurse.

Notes

Profession is usually inserted for identification purposes.

[2] Revocation Clause—cancels all *previous* wills and codicils.

[3] "Testamentary documents"—includes both wills and codicils.

[4] Wife's *name* should be mentioned—he may have a different wife by the time he dies.

[5] "In fee simple"—technical words showing that the entire freehold interest is disposed of.

[6] "Specific legacies"—*i.e.*, legacies of actua specified things.

[7] Not "my motor-car"; he may sell his p sent car before he dies and perhaps buy a n one, in which case there might be a dispute as whether he meant only the car he owned at t date of his will.

[8] This expression is defined in the Administ tion of Estates Act, 1925. It includes furnitu plate, china, wines, cigars, books, and other *p sonal effects*. It is better to use a word clea *defined* by Act of Parliament than a vague wo like "possessions."

[9] *i.e.*, all personal effects which the Testator not left or will not leave to anybody else.

[10] These words show clearly that, although wife is one of the Executors, with the duty clearing up the estate for the benefit of *all* the p sons to be benefited, these particular bequests for *her own personal benefit.*

[11] "Pecuniary"—*i.e.*, money.

[12] "Residue"—everything left after all other gifts have been disposed of, and debts pa

[13] Charging Clause, without which the Execu who is a Solicitor would not be able to charge his work on the Estate.

[14] This is the proper form of *attestation claus i.e.*, the clause showing that the proper formalit for signing and witnessing were observed.

Probate and Letters of Administration.—It i peculiarity of the English system that a decea person's estate, upon his death, does not "v in" (*i.e.*, fall into the possession of) the perso to whom he has left it by will, or among whom has by law to be distributed (the "beneficiaries the estate vests, in the first instance, in executor or executors, if he has appointed a such. (If he has made no such appointment, th pending the appointment of administrator administrators (see above), the estate vests (the time being) in the Presiding Judge of Probate Division of the High Court of Justi that Judge has no duties in relation to the esta but any notices that would, if there were executo have to be served upon them, must be served the time being upon him.) The generic name th applies both to executors and administrato when their title has been lawfully recognised. *legal personal representatives*; that is to say, th are *recognised by law as representing the decea person*, for all purposes under the law of proper and for most purposes under the law of contr and the law of tort. Generally speaking, deceased person's rights and liabilities are tra mitted to his legal personal representatives, a can be enforced by or against them as soon they have taken out a *grant of probate* or of *lett of administration.*

This "grant," in either case, is a docum issued by one of the Registries and bearing seal of the Probate Division of the High Co and the signature of one of its Registrars. states the deceased's name and address, the d and place of his death, and *either* (1) that his *will* has been *proved and registered* in the Regis concerned, or (2) that he died *intestate* (as the c may be); that (in the former case) the *executors,* (in the latter case) the *administrators*, whose nam addresses, and descriptions are given, are *entit to administer* (*i.e.*, to deal with) all the est which "vests in" them by law; and the docum concludes by certifying that an *Inland Reve Affidavit* has been delivered, showing the *gr and net values* of the estate and the amount *estate duty and interest* (if any) paid. Where will has been "proved," a photostat copy of will is bound up inside the "grant"; if no has been "proved" the "grant" consists o single sheet bearing the above-mentioned pa culars. It is important to note that, in eit

the *title* of the *legal personal representatives*
their legal right to deal with the estate) is
nced by the "grant"—*i.e.*, the document by
n the Court's authority is conferred upon
—and not directly by the terms of the will
their relationship (if any) to the deceased.
body, for example, who is *purchasing property*
deceased from the legal personal representa-
is required only to *satisfy himself that probate*
tters of administration have been granted to
; such a purchaser is not in the least con-
ed with the terms of the will.

henever any *formal transaction* has to be
ed out in connection with the deceased
on's estate the "grant" must be produced;
applies in particular to dealings with land or
ings, "things in action" (*see* **D23 2**)), the
tion, defence, or continuation of legal pro-
ngs for the benefit of the estate, and the
fer of the deceased's contractual rights.
e are, however, a number of *informal acts*
h the persons (if any) appointed by the will
executors, or the nearest relatives who intend
pply for letters of administration, may pro-
do before the issue of the "grant"; these
de such common-sense matters as arranging
uneral, safeguarding and insuring documents
valuables, feeding livestock, locking up
ises, and preserving property which would
iorate if neglected. All persons should,
ver, take care *not to sell or dispose of any part*
estate before the "grant" is issued; a person
without lawful authority, meddles with the
e may find himself regarded as *executor de son*
-i.e., placed in the position of an executor by
wn wrongdoing—and thereby bound to meet
abilities of the deceased person, and pay the
duties (if any), for which he ought to have
ded. Even a person named in the will as
itor takes a risk if he does more than the
urgently necessary acts before probate, since
y turn out that that will is, for some technical
n, invalid, or some later will may come to
in which he is not named.

t more than four persons can apply for a
of probate or letters of administration. If
fore the will names more than four executors,
persons named will have to decide among
selves which of them are to apply. Even
ere are no more than four, *none of them is*
elled to apply, unless he has already meddled
the estate; he can renounce his right by
ng a form of renunciation. If the deceased
ppointed no executor by will, one or more
exceeding four) of the next-of-kin can apply
etters of administration. Apart from the
al cases (see above) in which there must be
st two administrators, no grant will be made
y more distant relative of the deceased unless
ntil all nearer relatives have renounced their
or been "cleared off"; this last expression
s that it must be clearly shown that they
ead or for some other reason are incapable of
as administrators. (The order of priority
g the relatives entitled to take out a grant
) husband or wife; (2) children and their
oter issue" (*i.e.*, grandchildren, great-
children, etc.); (3) parents; (4) brothers
isters and issue of deceased brothers and
s; (5) half-brothers and half-sisters and
of deceased half-brothers and half-sisters;
andparents, and so forth.)

has been said above that the property of a
sed person "vests" on his death in his
tor or executors, if any; if there are no
tors it "vests" in his administrators as
as they have been duly constituted as such
he "grant." *In law* these *legal personal*
entatives (executors or administrators) have
ame *powers* of disposing of the deceased's
rty as if they were the owners of that pro-
in the fullest sense; but in accordance with
ules of *equity* (*see* **D4**) they must exercise
powers of disposal strictly in accordance with
is *just and conscionable*—*i.e.*, they must
bute the property itself, or sell it and dis-
e the net proceeds, as laid down by the
of the *will* (if any); in case of an intestacy,
l down by the *law of succession*, as set out
Intestates' Estates Act, 1952. That strict exercise of their powers which conscience demands will be enforced, in case of need, by the Chancery Division of the High Court of Justice (*see* **D5**), *at the suit of any beneficiary* under the will or intestacy. But *purchasers* and persons other than the beneficiaries can safely deal with the legal personal representatives as though they were legal owners of the deceased's property, provided the "grant" is produced as evidence of their powers.

The *procedure* in applying for a *grant of probate* or *letters of administration* is that the applicants must make a *valuation* of the various kinds of property of which the estate consists; the value of each item is to be the value on the date of death. (It is not usually necessary to employ a licensed valuer, though this may be helpful if the estate includes valuable jewellery, antiques, or works of art.) An *Inland Revenue Affidavit*, for death-duty purposes, must be *completed* and *sworn before a Commissioner for Oaths*. This document is one of a number of printed forms (varying according to the nature and composition of the estate, and obtainable from Somerset House, the Estate Duty Office, and certain principal post offices). It is divided into headed columns showing (*a*) the descriptions and the values of the various parts of the estate (*e.g.*, cash at bank, Government securities, stocks and shares, furniture and effects, and so forth); a separate section shows (*b*) the funeral expenses and the debts which the deceased left owing. The *gross estate* consist of the items under (*a*); the *net estate* is calculated by deducting those under (*b*) from the gross total (the cost of a tombstone cannot be deducted).

In the simplest cases *estate duty* is payable on the *net estate*, according to a sliding scale; but no duty is payable on an estate of £5000 or less. (In all but the simplest cases it would be wise to consult a solicitor, as the law relating to estate duty is excessively complicated.)

Another part of the document sets out particulars of the deceased and of the applicants, and the kind of grant required. The document, when sworn, must be forwarded to the Estate Duty Office, who will *assess the duty payable* (if any) and interest on such duty from the date of death. This must be *paid in full* before proceeding further, *except* the part of the duty that relates to *freehold property*, which may be paid by instalments. (The deceased's bank will usually grant a loan or overdraft for the purpose of such payment.) When the duty has been paid the Inland Revenue Affidavit will be returned to the applicants receipted.

The second document required is the *Form of Oath for Executors or Administrators*. This gives particulars of the deceased and of the applicants, as before, and declares *either* (*a*) that they believe the "paper writing" before them to be the deceased's *last will*, or (*b*) that the deceased died *intestate*; in either case they declare their *relationship* (if any) to the deceased, and the *capacity* in which they apply (*e.g.*, "the executors named in the will," or "the lawful widow of the deceased," or as the case may be); and they swear *to administer* the estate (the gross amount of which they mention) *according to law*, and to produce proper accounts whenever called upon to do so. This Oath must also be sworn before a Commissioner.

If there is a will it must now be signed (for identification purposes) by the applicants and the Commissioner for Oaths. If there is no will a third document is required, known as an *Administration Bond*. This is a printed form which must be completed and signed, sealed, and delivered (*see* **D9 2**)) by the applicants and two *sureties*—*i.e.*, independent persons who are willing to *guarantee* that the applicants will carry out their duties according to law, under the *penalty* of forfeiting double the value of the estate if there is any default. (In practice, an *insurance company* will usually undertake *the duty of surety* for a reasonable premium, and in that event no other surety is required.) The Bond must be executed (*i.e.*, signed, sealed, and delivered by the individual sureties, or sealed by the insurance company, and also signed, sealed, and delivered by the applicants) before a Commissioner for Oaths.

Finally, the applicants must take to the Principal Probate Registry at Somerset House, or to one of the District Registries outside London, (*a*) the receipted Inland Revenue Affidavit; (*b*) the duly sworn Oath for Executors or Administrators; (*c*) *either* the will (if any), duly marked with the signatures of the applicants and the Commissioner, *or* the Administration Bond, duly executed. If there is no hitch, the *grant of probate* or *letters of administration* will usually be posted to the applicants (or their solicitor) within about fourteen days.

(For the convenience of persons who have no legal adviser, there is a Personal Applications Department, situated in the Royal Courts of Justice, Strand, W.C.2, where the officials are extremely helpful in answering questions and showing applicants how to complete the forms. But in most cases trouble and delay will be avoided by employing a solicitor.)

II. Property in Land (Immoveable Property)

Although the *logical distinction* preserved in the legal systems of other countries is between property in land and buildings and property of other kinds ("immoveables" and "moveables"), English law has from an early date made the more artificial distinction between *real property* or *realty* (*i.e.*, *freeholds*) and *personal property* or *personalty* (*i.e.*, *leasehold* land and property of all other kinds). The reason is historical. In early times, if the possession of freehold land was withheld from its rightful owner, his remedy was an action for recovery of the actual thing withheld—*i.e.*, the freehold land itself—and that very *thing* (in Latin, *res*) would be restored to the owner under an order of the Court. On the other hand, when property of other kinds (including leaseholds) was withheld from its rightful owner, his remedy was an action against the wrongdoer, in which the remedy would be the award of *damages* against the wrongdoer *personally* (*in personam*)—not an order for the restoration of the actual goods or other property withheld. Although that distinction in the remedies is no longer generally applicable, the terms (*realty* and *personalty*) have been retained.

1. Realty or Freehold Property.—The difficulties of this branch of the law are due principally to historical reasons which go back to the Feudal System. In a very practical sense that System recognised only the Monarch as the *owner* of land; those who held it from him were *tenants* (in French, "holders"). If the tenancy was one which was not limited to expire at the end of a fixed period it was known as "an estate in fee simple"—*i.e.*, a *freehold*; a tenancy which was for a fixed period only was known as "a term of years absolute," or a *leasehold*.

When the Feudal System came to an end this distinction remained. A freehold estate in land is still an interest which has *no fixed expiry date*; and the freeholder, out of that unlimited interest, can "carve," as it were, *fixed leasehold terms*, during which tenants will hold the land of him.

The property legislation of 1925 has profoundly changed and simplified the law. Until the end of 1925 one important characteristic of the freehold estate was that of *primogeniture*—the rule that, on the death of the freeholder intestate, the freehold passed intact to his *eldest son* or (if he left no son) to his eldest male heir. This was abolished by the Administration of Estates Act, 1925, which enacted that, in the event of a person's dying intestate after December 31st, 1925, the *whole of his property* (realty as well as personalty) should devolve upon his legal personal representatives (*see* **D18**); and that it should, as one whole, be sold and converted into money so far as necessary for the payment of the deceased's funeral expenses and debts, death duties, administration expenses, and for distribution among his next of kin. The eldest son, or heir, has no longer any special privilege.

Settlements.—On the other hand, a freeholder (whom we will call Charles), having a freehold
estate in land—*i.e.*, an interest which has
expiry date—can *during his lifetime* crea
successive interests to take effect one by on
Charles can, if he so desires, *settle* his freeho
estate to be enjoyed by himself during his lif
time; after his own death, by his eldest so
George during that son's lifetime; then by h
second son John, during John's lifetime, an
finally by George's son Peter "in fee simple
The successive interests of Charles, George, an
John are called *life interests*; the ultimate, futu
freehold interest, reserved for Peter to enjoy aft
the deaths of his grandfather, his father, and h
uncle, is called a *remainder*. Both the life i
terests and the remainder are *rights of property*
which Charles, George, John, and Peter becon
entitled immediately the settlement is made—tha
is, they are *present rights* to the *future enjoyme*
of the property, and those rights can be dealt wit
at any time, even before they "fall into posse
sion." Since Charles, George, and John *mu*
some time die, Peter knows *now* that his freeho
remainder *must* come, some time, to him or h
personal representatives and, through them, to h
next of kin (see above); for even if he dies youn
while George and John are still alive, his right wi
not be "defeated" but will be preserved for tho
to whom his property may eventually pass und
his will or intestacy. Therefore that *present rig*
to *future enjoyment* is a piece of property whic
Peter can deal with *now*, unless he is under twent
one, or unless he is restricted by the terms of th
settlement from doing so. George and John ca
if they are so minded, do the same with their li
interests—that is, they can *now* sell to anoth
person, for hard cash, their present rights
future enjoyment, or they can mortgage (*i.e*
pledge) those rights against a loan, on the unde
standing that they will get back those righ
when the loan is repaid.

To watch over these successive interests, and
preserve the rights of the ultimate successo
Charles appoints *trustees* of the settlement, whos
duty it is to act impartially by all the beneficiarie
A *trust corporation* (usually one of the ban
trustee companies), which never dies, or *at lea*
two individuals, may act as trustees. Th
Trustee Act, 1925, provides for the appointmen
by a simple procedure, of new trustees to take th
place of those who die, become unfit, or unwillin
to go on acting, etc. In the last resort th
Chancery Division of the High Court (the gua
dian of equity) has power to make such an appoin
ment; for "equity never lacks a trustee."

In order to enable landed property to be freel
disposed of, it is provided by the Settled Land Ac
1925, that the person who is for the time bein
enjoying the current life interest (see above) ha
power to *sell the entire freehold* estate if he
desires. Nevertheless, the scheme of interes
under the settlement is not defeated, for th
purchaser from the tenant for life must pay th
purchase-money not to him but to the trustee
they must invest the money in safe investment
and carry out the provisions of the trust with th
necessary modifications. Each *tenant for li*
will then receive the *interest or dividends* on th
investments during his lifetime, just as former
he would have received the rents and profits
the land during his lifetime; while the *remainde*
man (Peter) will ultimately come into the *capit*
of the trust fund (*i.e.*, the investments themselve
in lieu of the freehold interest. (By the terms
a recent Act, half the investments may consist
stocks or shares in commercial concerns recon
mended by a stockbroker or other competen
adviser.)

2. Leaseholds.—We have seen above that th
freeholder, out of his estate which is unlimited
time, can "carve" fixed *terms of years absolute*
leasehold estates. These terms may be of an
length; the most common are terms of 999 and
years. The document by which such a term
granted is called a *lease*; the person granting th
term is the *landlord* or *lessor*; the person to whor
it is granted is the *tenant* or *lessee*. But the lesso
by the grant of a lease, has not given up
interest in the land. The lessor's freehold esta
is unlimited in time; when, therefore, the leas
hold term (however long) comes to an end, th
right to possession and enjoyment of the land w

to the freeholder. That right, known as a *ion*, is again a *present right* to *future enjoyment* as such, a piece of property which the free- r can, if he wishes, dispose of *now*. The of a reversion " is, in fact, equivalent to the of the freehold subject to an existing lease; nfers upon the purchaser the lessor's right to ve rent from the lessee throughout the lease- term, and at the expiration of that term to *sess and enjoy* the land without limit of time.

e *lessee* has a *legal estate* in the land for a *term* of years, and he in turn (unless pro- d by the provisions of his lease) can grant *rms* to expire at any time before his own *term*. This is a process which can be ted, in turn, by each lessee, underlessee, sub- lessee, and so forth, who will become respec- the underlessor, sub-underlessor, and so of the person to whom the next subordinate st is granted. Thus Michael, the free- r, by granting to James a term of 999 years, himself with a *freehold reversion* which will , at the expiration of the 999 years, into the ssion of the then freeholder. James, by the of an underlease, can carve (out of his lease- term of 999 years) a sub-term of 99 years in r of William, whose underlessor or landlord ecomes, leaving himself with a *leasehold ion* of 900 years. William, in his turn, can to Anne a sub-underlease for 21 years, g himself a *leasehold reversion* of 78 years, so forth. The relationship of lessor and , or landlord and tenant, subsists between m and Anne, James and William, Michael ames; this relationship is one of *privity of* as well as *privity of contract*. The former e means that each of these pairs of indivi- is linked by their *mutual interest in the same of years* as above described. The latter e, *privity of contract*, means that the *link is ctual*—it arises from the agreement between el and James contained in the headlease, reement in the underlease between James William, and that in the sub-underlease en William and Anne. But between Anne ames, between William and Michael, there elationship of any kind, neither of contract estate; Michael can look only to James, to William, and William to Anne, to carry e terms of the respective tenancies.

ertain circumstances, however, there may be *of estate* between two parties without *of contract*. Suppose Michael *conveys* ransfers) his freehold reversion, *during the ence of James's lease*, to Robert. Thereby t will take over all Michael's rights; *i.e.*, become lessor, in place of Michael, to James ee, as well as being entitled to possession e freehold when James's lease expires. en Robert and James there will be *privity e*, arising from their mutual interest in the f 999 years (as lessor and lessee respectively); ere is between them no *privity of contract*, bert and James have made *no agreement* ne another. The distinction may in certain stances be important.

Form and Contents of a Lease.—A lease for of more than three years must be made by **D9**(2)) between the lessor and the lessee. es and describes the parties, and sets forth return for an annual *rent* (and sometimes ment, in addition, of a lump sum called a *m*), the lessor *demises* (*i.e.*, lets) to the for a term of so many years from such and date, the land in question with the build- ected thereon. (In the law of property the gs go with the land on which they stand.) ollow the *lessee's covenants*—the promises he is to perform: to pay the rent by ted instalments, on certain dates; to pay axes, and other outgoings on the property; and keep the property in full repair; to he inside and the outside of the buildings ed times; to keep the property insured, ull value, in the names of the lessor and ; to permit the lessor periodically to the condition of the property; to carry pairs which the lessor, as a result of such ions, may call upon him to carry out. are some of the stock clauses; but every individual lease must be carefully studied in order to ascertain what the lessee's obligations are.

Next come the *lessor's covenants*—the promises which the lessor is to perform; the chief of these is that, if the lessee carries out his part of the bargain, the lessor will permit him " quiet enjoyment " of the property without disturbance during the term. Some leases also contain *stipulations* binding on both parties; for example, a *stipulation* that the rent shall be reduced or suspended if the property is damaged or destroyed by fire, and sometimes an arbitration clause. At the end of most leases comes a *proviso*, for the protection of the lessor, to the effect that he shall be entitled to expel the lessee, and to re-enter and repossess the property, if the lessee ceases to pay his rent or to perform his covenants as required, or in the event of the lessee's bankruptcy.

One copy of the lease (the *original*) is signed, sealed, and delivered (**D9**(2)) by the lessor, and handed over to the lessee as evidence of his *title* to the leasehold interest. The other copy (the *counterpart*) is signed, sealed, and delivered by the lessee, and handed over to the lessor as evidence of his entitlement to the rent and to the performance of the covenants by the lessee. The counterpart requires a stamp (impressed by the Stamp Duty Branch of the Inland Revenue) of only five shillings; but the original must be stamped at the rate of 10*s*. for every £100 of the rent (in addition to £1 for every £100 of the premium. No stamp duty is payable on rents up to £100; and the stamp on the premium under £4,500 is *nil* if the rent is £50 or less).

Statutory Reforms in Law of Landlord and Tenant.—The above text on *Leaseholds and Leases* sets out the common law rules. But, at various times since 1920, Parliament has considerably amended and added to those rules—particularly to protect (1) tenants of trade, business and professional premises, and (2) tenants of dwellings of comparatively low rateable value.

Business Tenancies.—The Landlord and Tenant Act, 1954, Part II gives security of tenure to the tenant of most business premises. Fuller details are given on **D33**.

Residential Tenancies.—The Rent Act, 1965 restores the security of tenure which had been undermined by the 1957 Rent Act; full securty of tenure, accompanied by rent regulation. is given to tenants of low and moderate-rented properties (*i.e.*, of rateable value up to £400 in London and £200 elsewhere). It is now an offence for a landlord to evict a tenant from premises of any value whatever without a court order. This is now a permanent part of the law of Landlord and Tenant, and replaces the temporary provisions of the Protection from Eviction Act, 1964.

The 1957 Rent Act allowed controlled rents to become decontrolled when the premises were re-let. The new Act stipulates that the vacation of a controlled property will result not in decontrol but in conversion on re-letting to a regulated tenancy under the new Act. For fuller details *see* **D33–4**.

3. Mortgages.—The word *mortgage* is Norman-French; its literal meaning is " dead pledge." The process of mortgaging land and buildings is roughly analogous to that of pawning a piece of jewellery as security for a loan of money—with the important difference that the land cannot, of course, be physically handed over to the lender (as can the jewellery) to be kept in his custody until the loan is repaid. But a pledge and a mortgage have this in common—that the parties intend no change of *ownership*; the *borrower* (the *mortgagor*) is and remains *owner* of the property *after*, as *well as before, the transaction*. In exchange for a loan of a certain sum, the *lender* (the mortgagee) temporarily enjoys a *charge* upon property worth (it may be) much more than that sum, as *security* for the repayment of the loan, with the stipulated interest, at the stipulated time. The *borrower* is still the property-*owner*.

Because of the essential immoveability of land, the mortgage transaction is effected by a *mortgage deed*, which sets out the terms on which the loan is granted. Generally speaking, the borrower (the mortgagor) is permitted to remain in *possession* of the mortgaged property unless and until he fails to pay an instalment of interest or to repay the capital when called upon, or unless and until he breaks some condition of the mortgage deed. In early times such failure was often the signal for the lender (the mortgagee) to oust him *permanently* from possession, and even to deprive him of *ownership* of the property. But the courts of equity (as we have seen, D4 2)) gradually evolved the rule that it was unconscionable for the lender to enrich himself, at a low cost to himself, from a transaction in which the intention of the parties was to *pledge the property temporarily* as a *security*, not to sell it permanently for a small sum. Hence was evolved the concept known as the *equity of redemption*—the rule that, even *after the legal date* fixed by the deed for repayment of the loan and for freeing the property from the mortgage, the borrower should still remain entitled to *redeem* the property (*i.e.*, to free it from the charge) by tendering to the lender the balance of the loan, with all interest and costs to date; and that the lender should thereupon be *bound* to give the borrower full and unfettered rights over the property, free from all the conditions of the mortgage, and in the same state as it was in originally. The lender (the mortgagee) must get no collateral (or additional) advantage of a permanent kind once the loan, interest, and costs were paid off; and this is still the law today.

The law, as stated above, has established the principle that the borrower who mortgages his freehold or leasehold interest, as security for a loan of money, shall not be deprived of his ownership, but shall retain such ownership after the execution of the mortgage deed. That deed is, in the first place, a *contract or agreement* under which the borrower promises to repay the loan to the lender, with interest at a certain rate, in one sum or by instalments, and meanwhile, for the lender's protection, to keep the property insured, in proper repair, and so forth. But that is not all; it is clearly important that the lender (the mortgagee) should, in addition, be granted an interest *in the property itself*—an interest which will enable him to take actual *possession* of the property, if need be, to enforce his rights, much as the pawnbroker has the right to *possession* (though not *ownership*) of the pledged article until the loan is repaid.

The Law of Property Act, 1925, devised a method of giving the lender (the mortgagee) a legal estate in the property while still preserving the rights of ownership of the borrower (the mortgagor). That Act provides that the grant of a mortgage of land, in *whatever form* it is effected, shall confer upon the lender (the mortgagee) *a term of years absolute*—*i.e.*, a *legal estate* in the *land itself*, which the mortgagee can deal with by sale, and which will be transmitted, as an interest in land, to his legal personal representatives upon his death. It is further provided that, on the final discharge of the mortgage (*i.e.*, the repayment of the loan, with all interest and expenses due to the mortgagee), that term of years shall *cease and be extinguished*, the mortgagor thereafter continuing to hold his freehold or leasehold estate *free from the mortgage term of years*, and free also from all the conditions of the mortgage deed.

In such a scheme it was necessary to distinguish the term of years conferred by the mortgage from any term of years absolute which might be or might have been conferred upon a lessee or underlessee by way of a lease or tenancy (see above, *Leaseholds*). For the purpose of such distinction the Act provides that, if the mortgagor's legal estate is a *freehold*, the mortgage deed confers upon the mortgagee a *term of 3000 years*, thus leaving to the mortgagor a legal *reversion* to commence after the expiration of that term (since the freehold estate is not limited to expire at any particular time). And if the mortgagor's legal estate is a *leasehold*, due to expire at the end of a fixed period, the mortgage deed confers upon the
mortgagee a *term of years to expire ten days bef*
the leasehold term, thus again leaving the mo
gagor with a legal reversion (in this case of t
days only).

In this way each party has a legal estate in t
land itself, quite apart from the *contractual* rig
and obligations in regard to the loan, which c
be enforced by and against him *personally*. T
mortgagor can sell his freehold *subject to*
mortgage term and the obligations of the mortga
deed; the mortgagee can *sell his mortgage te*
with the benefit of the rights that go with
The sale of a freehold (whether subject to
mortgage or not) is effected by a deed called
conveyance; the sale of a leasehold is effected by
deed called an *assignment*. The mortgage te
can be dealt with in a deed called a *transfer*
mortgage. In every case the purchaser takes ov
the vendor's legal estate in the land, subject to,
with the benefit of, the personal obligations
rights in the original deed. In case of the dea
of the mortgagee or mortgagor, the legal estate
question, and the rights or obligations, are tra
mitted to his personal representatives.

Finally, it should be mentioned that, as
additional safeguard, the *title deeds* (evidencing t
mortgagor's freehold or leasehold title) must
handed over to the mortgagee when the mortga
deed is executed, as part of the latter's securit
The mortgagor must take care to get them ba
when he *redeems* the property by paying off t
loan, interest, and expenses.

4. **Title.**—(a) *Evidence of title.*—Before freeho
or leasehold property changes hands, it is the du
of the purchaser's solicitor to *investigate title*-
i.e., to satisfy himself that the vendor has a prop
title himself and a proper right to convey or assig
Generally speaking, the purchaser's solicitor mu
go through the deeds (evidencing sales, tra
missions on death, grants of leases, grants a
redemptions of mortgages) for at least *thirty yea*
back; he must check every step in the *devoluti*
of title (*i.e.*, every change in ownership) and ma
requisitions (*i.e.*, demand explanations) on a
point which is doubtful. This is still the syste
over the greater part of the country. No stam
duty is payable on conveyances up to £4,50
from £4,500 to £6,000 it is 10*s*. per cent; after th
it rises to £1 per cent.

(b) *Registration of Title.*—With a view, howeve
to simplifying such procedure the Land Registr
tion Acts have provided for a different syste
In areas to which an Order in Council has ma
the system applicable, *registration of title*
compulsory upon any sale of freeholds, or
leaseholds having more than forty years to ru
Registration is effected in the following way: t
Government lawyers at H.M. Land Registry,
Lincolns Inn Fields, London, W.C.2, or so
District Registry, investigate the title of eve
freehold or leasehold sold after the appropria
date, *once and for all*. If they are satisfied that
is in order, they register the owner as *register*-
proprietor of the land with *absolute title* to his fre
hold or *good leasehold title* to his leasehold. (The
kinds of titles indicate that the title is unexce
tionable, but if there is a slight doubt the pr
prietor may be granted a *qualified title*; and if
is in possession of the land he may be granted
possessory title, which signifies little more than t
fact of possession. The Chief Land Registrar
empowered, however, to convert both qualifi
and possessory titles into absolute or good leas
hold titles, after fifteen years in the case of fre
holds, and after ten years in the case of leasehold

The Land Registry issues to the register
proprietor a *land certificate*, certifying (on beh
of the Government) that a registered title of t
appropriate kind has been granted. In a
further transactions relating to that particu
land the purchaser's solicitor need not conce
himself with the original deeds save in exceptio
cases; he can generally rely upon the certif
statements made in the *land certificate*, on wh
the name of the new registered proprietor

ed by the Land Registry officials when a *er* in his favour, or the grant of a lease to is lodged at the Registry. There are priate sections in the land certificate for ration of a mortgage and the particulars of ortgagee for the time being.

istration of title is compulsory in a number as, and at the time of going to press a Bill before Parliament to extend compulsory ration, on sale, over the whole country.

Joint Ownership.—If two or more persons are wners of freehold or leasehold property, that not mean that A owns one part of the land uildings, and B and C other parts; the effect t all of them *jointly own the whole.* (The gy will be clear if the reader considers the f a motor-car owned jointly by A, B, and C; y *all three own the entire car* between them; not be said that A owns the engine, B the s, and C the body.) The Law of Property 925, recognises such joint ownership of land eans of a device known as a *trust for sale.* espective rights of A, B, and C (equal or al) can be fully enforced only if and when roperty is *sold* and the net proceeds of sale, ney, divided up in the proper proportions; ny or all of the joint owners can insist upon ale or division for the purpose of obtaining proper shares. But, while the property ns unsold, all the joint owners have rights ding to the proportions of their shares; if, xample, the property is let, the net rents, paying for repairs and other expenses, must vided between them in those proportions. four persons can jointly own a freehold or old legal estate in land; if more than four titled to the *beneficial interest*, then four of number only must hold the *legal* estate, and will enforce the *beneficial rights* of all t the legal owners. A purchaser from joint s of the legal estate is concerned only with tters' *legal title*; provided he hands over the ase-money to them (not being less than two), nebody authorised by them, *the purchaser is sponsible* for what they may do with that . If those legal owners, from whom the aser buys, fail to pay over the proper shares se *beneficially interested*, it is for the latter orce their rights against the vendors, who old the legal estate, by action in the Chan- Division, the guardian of equity. The aser's title to the land itself is not affected e vendors' failure properly to carry out the of the trust for sale, so long as the *legal* has been properly transferred to him and he id the purchase-money to *not less than two* wners.

. Property Other than Land (Moveables)

hattels.—Chattels are *concrete things* which the subject of ownership, other than land ldings, and other than objects so closely to land or buildings that they are regarded t thereof (*e.g.*, growing crops and trees, or lord's fixtures" built into some structure or ely attached that they cannot be removed t serious damage to the structure).

the ordinary way chattels can be *sold* or *way* without any special legal formalities— by *physical transfer*—*i.e.*, by the owner g them over to somebody else. If a l is to be *mortgaged* as security for a loan, rocedure differs according to whether the pledging it (the borrower) is or is not to *possession* of the chattel. (His *ownership*, er case is not disturbed.)

f, as happens when an article is *pawned*, the er is not to keep the article in his possession, nds it over to the pawnbroker, who hands exchange the agreed loan and a *pawn-* On production of the pawn-ticket, and the nent of the loan with the stipulated interest, rrower is entitled to receive the article back. sion is made by law for cases where the er defaults in payment, or where an unreasonable time elapses before he seeks to *redeem* what he has pledged.)

(*b*) If, however, the arrangement is that the *borrower* is to *retain possession* of the mortgaged article (as may happen if he borrows from a *moneylender* on the security of his furniture), then the borrower must execute and hand to the lender a document called a *bill of sale.* The law relating to such a document is extremely complex; but the most important provision is that the lender cannot enforce his rights unless he *registers* the bill of sale, at the Bankruptcy Court, in a register which any member of the public can inspect for a small charge. If then some member of the public desires to purchase the article from the person in whose possession it remains, but has reason to suspect that that person, though he may be the owner, has mortgaged it to a money-lender, it is open to the proposing purchaser to inspect the *register of bills of sale* to satisfy himself on the point. If he finds an entry against the owner's name, he will be wise not to proceed with the transaction. If he finds no such entry, and has no reason to believe the owner to be bankrupt, he can usually assume that there is nothing to prevent the person in possession from passing a good title to him. The proposed purchaser can also inspect the register of bankruptcies in order to see whether the vendor has the right to sell (*see* **D8**(**1**)).

2. Things in Action.—These (*see* **D16**(**1**)) are *intangible rights* which can be owned and dealt with but, because of their abstract nature, cannot be *physically* transferred. If Brown owes Jones £50, Jones (the creditor) can transfer to Robinson the right to collect the £50 from Brown. Jones does this by a document called an *assignment* of the debt and (most important) by giving *written notice* to Brown (the debtor) that Robinson is now the creditor instead of Jones.

Similarly, if Jones owns ten shares in Brown & Co., Ltd., Jones will hold a *share certificate*—*i.e.*, a document certifying the amount of his shareholding. He has certain rights in the company, but these depend upon the company's *memorandum and articles* (**D8** 2)) and upon the *registration* of his name in the company's register of shareholders. The share certificate is only *evidence* of his rights—it is not in itself a piece of property, and the physical handing over of the certificate will effect nothing unless Jones executes a *share transfer* in Robinson's favour and Robinson sends it to the company for registration, together with the old share certificate in Jones's name. After *registration* of Robinson's name, the company will destroy the old certificate and issue a fresh one to him.

Again, if Jones has insured his life with the Brown Life Assurance Society, he will have received a *policy* which is *evidence* of the right of his legal personal representatives to be paid £1000 on Jones' death. If Jones wishes, during his lifetime, to transfer that benefit to Robinson, he can do so, but it will not suffice for him merely to hand Robinson the policy. To transfer the *rights* under the policy he must execute an *assignment* in which it is stated that Jones, being the policy-holder and entitled to certain rights thereunder, now *assigns* those rights to Robinson. But no transfer of those rights will have been effected until Robinson has *notified* the Assurance Society of what has been done and sent it the policy and the assignment for *registration* in its books.

These examples illustrate the principle, set out in the Law of Property Act, 1925, that an *unconditional assignment*, in writing, by a person (the assignor) entitled to any debt or other thing in action, in favour of another person (the assignee), if *notice in writing* is given *to the debtor* or other person on whom the obligation rests (in the above examples, to Brown, the Company, and the Assurance Society), shall entitle the assignee to all the assignor's rights, including the right to enforce those rights by action in the Courts, without calling upon the co-operation of the assignor in whom the right to the debt, or other thing in action, was originally vested.

DIVORCE AND OTHER MATRIMONIAL CAUSES

1. HISTORICAL SKETCH

The anomalies in this branch of the Law of England, and the legalistic attitude of the Courts to the subject, are principally due to historical reasons. For centuries the Church of Rome was the supreme ecclesiastical authority, and the law of that Church (Canon Law) applied to *matrimonial causes*—that is to say, disputes relating to any marriage and the mutual rights and duties of the spouses. Marriage was *indissoluble*—that is, there was no such thing as divorce in the modern sense of *breaking the legal tie*. But the Ecclesiastical Courts, which alone administered the matrimonial law before 1858, might for certain reasons grant a *decree of nullity* (a declaration that a particular "marriage" was null and void). In other cases they might grant what is now called a *legal separation* (known, in those days, as a "divorce *a mensa et thoro*," *i.e.* banishment from bed and board); this latter decree, however, *did not dissolve* the marriage bond, but merely gave judicial sanction to the spouses' living apart from each other, and regulated the terms of the separation. After the Reformation the Ecclesiastical Courts continued to deal with matrimonial causes on the same legal principles as before.

As a result of the Acts of Supremacy passed in the reigns of Henry VIII and Elizabeth I, the Sovereign was declared to be the supreme governor of the Realm in all spiritual and ecclesiastical, as well as temporal, causes. This royal supremacy, exercised constitutionally through Parliament, was part of the law of the land; since there was no limitation upon the power of Parliament (*see* **D5**), special Acts were passed, from time to time, to effect that which neither the Ecclesiastical nor the Civil Courts then had jurisdiction to do, *viz.*, to break the marriage tie itself. A divorce of this kind, known as "divorce *a vinculo matrimonii*" (a divorce from the marriage bond) was rare, for the procedure was cumbersome and expensive. Except by the passing of a special Act of Parliament, there was no means of getting a marriage dissolved before the year 1858.

The Matrimonial Causes Act, 1857, transferred the jurisdiction in matrimonial matters from the Ecclesiastical Courts to the new Civil "Court for Divorce and Matrimonial Causes"; but perpetuated the old ecclesiastical practice with regard to nullity suits and judicial separation (formerly known as "divorce *a mensa et thoro*"). Apart from this rearrangement, the Act took the revolutionary step of conferring upon this Court a new judicial power—that of granting a *divorce in the modern sense* of a complete *dissolution of marriage*. As we have seen (**D5**), the Supreme Court of Judicature Act, 1873, and subsequent legislation, set up one single High Court of Justice, of which the Probate, Divorce, and Admiralty Division formed part, taking over (with other work) the jurisdiction which had been conferred in 1857 upon the "Court for Divorce and Matrimonial Causes." This jurisdiction remains in the hands of the Probate, Divorce, and Admiralty Division to-day. Great changes have been effected *by statute* (notably in 1923, 1925, 1937, 1950, and 1963) extending the grounds for divorce and the jurisdiction of the Court; but in the *interpretation and adaptation of principles* the great body of *case law* (*see* **D4**), which enshrined the principles and practice of the old Ecclesiastical Courts, is not without its influence to-day. The principles of equity (*see* **D4**), however, have not modified the strict legalism of this branch of the law; *equity has no application to the law of matrimonial causes* (except for resort to *injunction* (*see* **D11**) for the protection of the wife's person or property).

2. POWERS OF INFERIOR COURTS—SUMMARY JURISDICTION

Concurrently with the jurisdiction of the Divorce Division of the High Court, Magistrates' Courts
now have power (Matrimonial Proceeding
(Magistrates' Courts) Act, 1960, and Rules mad
thereunder) to grant relief (by a *matrimonial order*
to *either spouse* (the *complainant*) in certain case
of misconduct on the part of the other spouse (th
defendant). The procedure is simpler, quicker
and cheaper than in the High Court. A Magi
strates' Court may grant a matrimonial order; i
such order provides (*a*) that the complainant shal
be no longer bound to cohabit with the defend
ant that has the same effect as a High Court de
cree of judicial separation (*see* **D28**). A Magi
strates' Court may also provide (*b*) that th
husband shall pay the wife (or (*c*) where the hus
band's earning capacity is impaired by age
illness, mental or physical disablement, that th
wife shall pay the husband) weekly maintenanc
up to £7 10*s*. plus (*h*) up to 50*s*. for each depend
ant child; (*d*) the child's custody (up to 16 year
of age) may be granted to the complainant o
(*e*) to a county council or county borough counc
or (in special circumstances) (*f*) such child ma
be ordered to be placed under the supervision o
an independent person (such as a probation officer
and (*g*) access to the child may be granted to eithe
spouse or to any parent. (There are special pro
visions relating to (*d*), (*e*) and (*f*).)

Either spouse may apply for relief on the groun
that the defendant—

(1) has *deserted* the complainant;

(2) has been guilty of *persistent cruelty* t
the complainant or an infant child of th
complainant or of the family;

(3) has been convicted (i) on indictmen
(*i.e.*, by a jury) of any *assault* on the com
plainant, or (ii) by a Magistrates' Court o
certain offences (involving imprisonment fo
not less than one month) *against the person* o
the complainant, or (iii) of a *sexual offen*
(or an attempt thereat) against an infant chil
of either spouse who is a child of the family

(4) has committed *adultery*;

(5) while knowingly suffering from *venere*
disease, has insisted upon sexual intercour
with the complainant, or permitted suc
intercourse without the complainant bei
aware of such disease;

(6) is a *habitual drunkard* or a *drug a*
dict;

(7) being the *husband*, has compelled t
wife, or led her, *to submit to prostitution*;

(8) being the *husband*, has wilfully *ne*
lected to provide reasonable maintenance for t
wife or any dependant child of the family;

(9) being the *wife* (*in case* (*c*) *above*) h
wilfully neglected to provide, or make
reasonable contribution to, *reasonable mai*
tenance for the husband or any dependa
child of the family, having regard to a
resources of the spouses.

A Magistrates' Court has jurisdiction to hear a
such complaint *if either spouse ordinarily resides*
the Court district, or (except in (3) above) *if*
cause of complaint arose in that district, or (in ca
(3)) if the offence or attempt arose in that distri
Jurisdiction is also exercisable *if the complain*
resides in England and the parties last resid
together in England (even if the defendant n
resides in Scotland or Northern Ireland), or *if*
defendant resides in England though the co

ant resides in Scotland or Northern Ireland. Court may order the *costs* of the application paid by either party.

ne general rule is that a complaint under (4) e must be made *within six months* of the date the act of adultery first became known to the plainant. A complaint on any other grounds generally be made within six months of the nd of the complaint arising, unless the com- ant was abroad at the time; but this time does not apply to such continuing offences sertion (see below) or wilful neglect to main-

ese "domestic proceedings," as they are ed, may be heard before one stipendiary lly qualified magistrate) or not more than justices of the peace, including, so far as ticable, both a man and a woman. The *ng* is *in private*, the public being excluded, newspapers are prohibited from publishing ls; "domestic proceedings" must be dealt separately from other matters, and reports probation officers may be received on the ct of any attempted reconciliation or on the ns of the parties. In general, the magistrates ld apply the same general principles as are ed in the Divorce Division; lay justices of the are advised on the law by their legally fied clerk.

Magistrates' Court, however, has *no power to a divorce* or *to annul a marriage;* the sole diction to make such a decree is in the hands ne Divorce Division of the High Court of ice.

order may be enforced by committing the ndant to prison if his failure to comply with order is shown to be due to wilful refusal or ble neglect. (*See also* D32(1)).

order is enforceable while a wife is *residing her husband*, and *no order* may be made on the cation of a complainant where it is proved he or she has been *guilty of adultery*, unless the ndant condoned or connived at (see below), or is wilful neglect or misconduct conduced to tended to lead to), the adultery. An *order dy granted* will be *discharged* (i.e., its effect be terminated) on *proof of the complainant's ery*, or *on* proof that the spouses *voluntarily ned cohabitation.*

a matrimonial cause is pending in the Divorce ion of the High Court, no application for a ration or maintenance order ought to be dealt by a Magistrates' Court. And a Magistrates' t may refuse to make any order when the suit estion would, in its opinion, be more con- ntly dealt with by the Divorce Division.

peals. A Magistrates' Court has power "to a case," upon *a point of law* (not a question of arising on the application, for decision by a ional Court consisting of two or more judges e Divorce Division. And an appeal from a ional Court lies to the Court of Appeal, by of either the former or the latter.

ATRIMONIAL CAUSES in the DIVORCE DIVISION of the HIGH COURT

onstitution of the Court

e President of the Probate, Divorce, and ralty Division and not less than three other Court Judges attached to that Division are ermanent judges for Matrimonial Causes. sit both at the Royal Courts of Justice in on and at Assizes. Certain subsidiary duties erformed by the seven Registrars of the ipal Registry of the Division at Somerset House, and by District Registrars in the principal cities of England and Wales.

(2) Practice and Procedure

In contrast to "domestic proceedings" in Magistrates' Courts, the *Judges* of the Divorce Division sit normally in *open court*, though they have power to sit *in camera* (in private) where the ends of justice so require. In *nullity proceedings*, however, it is provided by statute that evidence on the question of *sexual incapacity* must be heard *in camera* unless the Judge is satisfied that the ends of justice require such evidence to be heard in open court. Press publicity is limited by statute to certain matters, and the publication of indecent matter may give rise to prosecution, in *any* matrimonial proceedings.

In general, practice and procedure in the Divorce Division are governed by statute, by rules of Court framed by a judicial committee under statutory authority, and by the principles and practice of the old Ecclesiastical Courts—except in proceedings for dissolution of marriage, which the old Courts could not entertain (*see* D24(1).

(3) Relief and Grounds for Relief

(a)—Nullity of Marriage. The Court has power to declare a "marriage" null and void in two main classes of case:

> (i) "*Marriages*" *Void from their Inception*—*i.e.*, where one of the parties had *another husband or wife living* at the time of the ceremony; where there was a *mistake* as to the *nature* of the ceremony, or the *identity* of the other party; where one party had been declared of *unsound mind* and was detained as a lunatic at the time of the ceremony; where the parties were within the *prohibited degrees* of relationship (*e.g.*, brother and sister, or uncle and niece); or where the *ceremony was not in due form*, or was a mock "marriage."
>
> (ii) *Marriages which are Voidable*—*i.e.*, which stand good unless and until one party or the other ("the Petitioner") successfully petitions the Court for annulment—*i.e.*, where either party was sexually *impotent at the date of the ceremony*; where either party has wilfully *refused to consummate* the marriage; where the marriage was *induced by threats* or fear or duress (*i.e.*, force), or where one spouse was *intoxicated* at the time of the ceremony.

The Act of 1965 (re-enacting in part the Act of 1950) has (somewhat illogically) added certain other grounds: (*a*) where either party was, at the time of the ceremony, in fact of *unsound mind* but had not been declared so, or was then a *mental defective*, or then subject to recurrent fits of *insanity or epilepsy*; (*b*) where the other spouse was, at the time of the marriage, suffering from *venereal disease* in a communicable form; and (*c*) where the wife was, at the time of the marriage, *pregnant by some person* other than the petitioning husband. But in these last cases (*a*), (*b*), and (*c*) the Court must not grant a decree unless it is satisfied that the petitioner was, at the time of the marriage, ignorant of the facts alleged; that the proceedings were instituted within a year of the marriage, and that there has been no sexual intercourse between the parties, with the consent of the petitioner, since he or she discovered that there were grounds for a decree of nullity.

Where a "marriage" is *void* (see above) the law regards it as *never having taken place* at all. Where it is *voidable*, the decree *annuls the marriage retrospectively* from its inception; but certain transactions between the parties while they actually remained married are validated, and the Court has power to order maintenance for the woman; and *any child* who would in the normal way have been the legitimate child of the parties *remains legitimate*, notwithstanding the annulment.

Sterility—i.e., inability to produce children—is not, in itself, a ground for annulment of the marriage. If the *impotence* of one spouse appears to be *curable* without danger the Court may, before pronouncing a decree, require that opportunity for *cure* be first given. If he or she *refuses to undergo examination or treatment* the Court may infer, after hearing the other party's evidence, that impotence exists. The petitioning husband or wife may ask for a nullity decree on the ground of *his or her own impotence*, provided he or she did not know of it at the time of the marriage. And there have been recent cases in which *both partners* have been granted decrees.

Apart from the one-year rule (mentioned in the last paragraph but two) in certain cases, delay (however long) in petitioning for nullity is no bar to the grant of a decree.

(b) Divorce.—(i) *Its Nature and Purpose.*—Divorce means the *breaking of the legal tie* of marriage by a decree of the Court. There is much controversy on the subject, some of it ill-informed, and much of it tinged with emotion and prejudice. It is not the purpose of this sub-section to take sides in the controversy, but (so far as possible) to remove misconceptions and to set out the various points of view.

We have to start by facing the unpalatable truth that *some marriages do break down* in fact. The symptoms of break-down may be continual strife, and sometimes violence, between the spouses, so long as they continue to live together; or there may be an actual breaking-up of the home because one or the other finds the situation intolerable and leaves. The function of the law should be to deal with this state of affairs as best it can, paying due regard: (*a*) to the interests of the children (if any), who are innocent parties to the dispute: (*b*) to the interests of the spouses and of any third party involved: (*c*) to the interests of public decency and the safeguarding of family life generally.

The problem has suffered from over-simplification by the Press and the protagonists on either side. Sometimes it is represented (quite inaccurately) as a conflict between those who want divorce to be " easier " or " harder " to obtain. Sometimes it is said that divorce as an institution is " causing the break-up of family life." This is a superficial view, ignoring the true nature of the problem, and confusing effect with cause. Happily married couples do not seek divorce. Divorce is the drastic *remedy* provided by the civil law in the case of a marriage which has already *broken down in fact*; the availability of divorce does not bring about the break-down, any more than the availability of surgical treatment can be said to bring about ill-health. A marriage may break down—that is to say, the " kernel " of the marriage, the mutual respect and affection between the spouses, has withered away; only an empty shell—the legal tie—continues to subsist between them. How should this situation be dealt with by law?

It is common ground, among both the upholders of the orthodox view and those who advocate reform, first, that every possible effort should be made, by private individuals and public institutions, to effect a reconciliation, if at all possible. Such efforts are favoured by the law, and excellent work is done to this end by religious organisations, medical men, probation officers, lawyers, and such institutions as the Marriage Guidance Council.

Secondly, it is common ground that, if such efforts are unsuccessful and the *breach proves irreparable* in fact, the interests of the children (if any) should be paramount, and no pains should be spared to secure their proper care and maintenance. This is laid down by law; the Judge in
matrimonial cause may take the initiative in pro
viding for the custody, maintenance, and educa
tion of the children, or for placing them under th
care of the Chancery Division (*see* D5); wheth
the initiative is taken by the Judge or by one
the parents, the welfare of the children is the *par*
mount consideration, irrespective of the rights an
wrongs as between the parents. Nobody will den
that, once the marriage has broken down *in fac*
the children will suffer to some extent; but it doe
not follow that they would suffer less if the leg
tie between the parents were preserved, or if th
home, with its atmosphere of strife, and perhaps
violence, were kept together at all costs—eve
assuming such a thing were possible. A divor
may not be granted unless the Judge is satisfie
that all possible arrangements have been mad
for the care and upbringing of the children (D31

It is at this point that the main controvers
begins. Where the " kernel " of the marriage ha
withered away, should the " shell "—the legal t
—be preserved or discarded? And if discarde
then in what circumstances and on what co
ditions? The present answer of the law is a no
altogether satisfactory compromise.

The Christian Churches declare that marria
is not merely a civil institution but a religio
sacrament, and the Roman Church regards it
indissoluble. This last is a matter of religio
dogma and belief; not a question for ration
argument. It is a view as deserving of respect
any other; but, as we have seen, it was abandone
by Parliament a century ago, and is unlikely to
reinstated in the civil law of England. Ma
churchmen regard this view as binding on the
consciences, but it is no longer the law of the lan
For better or worse, a marriage can now be legal
dissolved, leaving each party free to contra
another union if he or she so desires. On wh
basis, then, ought such dissolution to be grante

This is the second stage of the controvers
The conventional view, the attitude of the prese
law, is that a decree of divorce can, and ought t
be granted solely as a result of some *matrimoni*
misconduct by the " guilty " party, entitling t
" innocent " party—and only the " innocent
party—to go to the Court for relief. Accordi
to this view, the decree of divorce (though in la
a merely civil remedy) is regarded virtually as
the nature of a *penalty* upon the " guilty " par
for his or her wrongdoing—a view that has su
vived from biblical times. The reformers co
sider this an anachronism and an anomal
pointing out: (*a*) that in those times (as is the ca
under Islamic law to-day) it was only the husba
who could divorce his wife (not *vice versa*)—a st
which was then a very severe punishment, sin
divorce meant, for the woman, disgrace, degrad
tion, and poverty; whereas there is to-day lit
or no economic penalty or social stigma up
the " guilty " spouse, who is frequently no less
and often more—desirous than the " innocen
spouse of obtaining his or her freedom. T
reformers further emphasise: (*b*) that the mat
monial law has never pretended to identify its
wholly with the doctrines of the Church;
example, the Book of Common Prayer declar
of marriage, that " first, it was ordained for t
procreation of chiluren "; yet not even t
Ecclesiastical Courts went so far as to annu
deliberately childless marriage, and under t
present law a refusal to have children is not
matrimonial offence and involves no penal
Finally, (*c*) the reformist view is that the esse
of the married state—the " kernel "—is t
mutual respect and affection between the spous
once that " kernel " has withered away and t
marriage has *irretrievably broken down in fact*, t
preservation of the legal tie is a mere preten
the breaking of that legal tie, from the point
view of public decency, should be regarded as t
necessary and proper result of the break-down
the essence of the marriage, or the break-up of
marital home. Under the present system, a
fusal by the " innocent " party to take proceedi
for divorce, however malicious his or her mot

uch refusal, cannot be questioned, and this
s for irregular unions and illegitimate births;
e other hand, the law's insistence that there
be an "innocent" and a "guilty" party
tably induces two spouses, who find their
intolerable, to resort to unworthy subter-
; under a more rational system (such as
ns, for example, in the Scandinavian states)
parties might amicably join forces to have
narriage dissolved, once it was quite clear that
ciliation was out of the question. Parlia-
has recently discussed the advisability of
itting a divorce where the spouses have
lly lived apart for 7 years; but without
ss.

these view-points, and others, were con-
ed by the Royal Commission which heard
nce in 1951–55 and made certain recom-
lations in 1956; its Report, however, was by
eans unanimous, and the law, by and large,
ins unchanged. That is to say—only the
ocent" party, except in "discretion cases"
1)), can take proceedings for divorce against
' guilty" party; the law has sternly set its
against "divorce by consent" in any cir-
tances—if such consent comes to light. But
mmittee appointed by the Archbishop of
erbury reported in favour of the "reformist"
(D26(2)) at the end of July 1966; and the
Commission (D5–3) is likely to support its
nmendations.

Grounds for Divorce. The *Petitioner* (*i.e.*,
usband or wife who is *asking the Court for a*
ce against the other spouse) may present a
on on the ground that the *Respondent* (the
spouse):

(*a*) has since the celebration of the marriage
committed adultery;

(*b*) has *deserted* the Petitioner *without*
cause for at least *three years* preceding the
presentation of the petition; but, by the Act
of 1965, the 3 years' period is not to take
account of any one period of 3 months during
which the spouses came together again with a
view to reconciliation.

(*c*) has since the celebration of the marriage
treated the Petitioner with *cruelty*; or

(*d*) is *incurably of unsound mind* and has
been *continuously under care and treatment for*
at least five years immediately preceding the
presentation of the petition. (*See also* D31(2).)

rther, a *wife* may petition for divorce on the
nds that:

(*e*) her husband has, since the celebration
of the marriage, been guilty of *rape, sodomy,*
or bestiality.

ally, to cover those cases where one of the
es has disappeared and not been heard of for
years:

(*f*) any married person who alleges that
easonable grounds exist for *supposing the*
ther party to be dead may petition the Court
o have it presumed that the other party is
dead and *to have the marriage dissolved.*

petition for divorce on any ground may be
nted *until the expiration of three years* from
ate of the marriage, unless a Judge is satisfied
there is a case of *exceptional hardship* upon
etitioner or *exceptional depravity* on the part
Respondent. Whether there is such a case
uestion for the Judge's discretion upon the
nce brought before him.

to the above-mentioned grounds for
ce:

Adultery means *voluntary sexual intercourse*
en a husband and a woman who is not his
or between a wife and a man who is not her husband. (A woman who has been raped—*i.e.*, forced to have intercourse with another man against her will—is not guilty of adultery.) For obvious reasons, *direct evidence* of the act of adultery is rare, and the Court may infer from circumstantial evidence that adultery has taken place.

(b) *Desertion* means, primarily, the *intentional permanent abandonment*, by one spouse of the other, *without that other's consent*, and *without reasonable cause.* Therefore there is *no desertion* in such cases (for example) as: (i) where a husband *cannot* live with his wife because he is serving a sentence of imprisonment; (ii) where a husband leaves his wife for a *short time* for necessary business or family reasons, *intending to return to her*; (iii) while a *separation continues with the consent of both parties*; (iv) where the spouse who abandoned the other had *just cause* to do so; (v) any one period of 3 months cohabitation with a view to reconciliation does not break the period of desertion.

Indeed, in certain cases under (iv) the doctrine known as constructive desertion may apply *against the other spouse*, if he or she has (figuratively speaking) *driven the first spouse away. Constructive desertion* means, not "desertion" in the literal sense of walking out of the matrimonial home, but conduct on the part of a husband which is intended to force, and virtually forces, his wife to leave him, or *vice versa.* Thus, if a husband brings his mistress to live with him in the matrimonial home and, as a result, his wife leaves him, not only is the wife innocent of desertion in the legal sense, but the husband is himself guilty of constructive desertion; it will be presumed against him that he intended to terminate his marital association, and he has in fact *carried out that intention.* Such a case illustrates the principle that there are *two elements* in the legal meaning of *desertion*—the *act* of physical separation and the *intention* to bring normal married life to an end.

In order to bring about desertion it is not necessary that the spouses should cease to live under the same roof; "desertion is not withdrawal from a place, but from a state of things." It is sufficient that the Respondent (the "guilty" spouse) has withdrawn from, or forced the other to withdraw from, *cohabitation*—*i.e.*, from sharing a common "home" in the full sense of the word. A wife "deserts" her husband if she refuses (against his will) to share his room, to take her meals with him, and to perform the usual duties of a wife. On the other hand, the mere refusal of sexual intercourse, in itself alone, does not amount to desertion, though it *may amount to cruelty* (D28) if it has broken or is likely to break the health or spirit of the Petitioner.

It should also be noted that desertion is not a single act but a continuous state of affairs. The Petitioner must prove beyond reasonable doubt *that desertion without cause continued* during the entire period of *three years* required by law as the basis of a divorce petition. Although (see above) desertion in the legal sense must be *without the consent* of the petitioning spouse, recent judicial decisions have tended to dispense with the requirement that the deserted party must prove a *continuing desire* for the deserting party to return, and a *continuing willingness* to receive and reinstate the deserting party, during the *entire period of three years* preceding the commencement of proceedings; in other words, once the latter party's *original act and intention of deserting* has been proved, that intention is *presumed to have continued*, unless there is evidence to the contrary. (But see above (b)(v).) But any kind of *agreed separation* is fatal to the case, whether the agreement be in writing, by word of mouth, or implied by conduct. An agreement, however, by a husband, who is *already living apart* from his wife, to *maintain* her and the children does not constitute a separation by agreement, unless there is evidence that the *wife actually consented* to his leaving her. A *matrimonial order* made by a Magistrates' Court (*see* (D24(2)) does not necessarily prevent the period of desertion from running, unless the order contains a clause, deliberately inserted, to the effect that "the parties shall no longer be bound to cohabit."

If the deserting party makes an *offer to return* to the matrimonial home it is the duty of the other party to receive him (or her) back and to resume normal married life together, *if the offer to return is genuine* and if no other matrimonial offence (such as adultery or cruelty) has been committed by the deserting party. Whether such an offer is "genuine" is a question of fact, to be decided on all the evidence; it will generally be a wise safeguard for a deserted party who receives such an offer to *take legal advice* before accepting or rejecting it; for if rejection of the offer subsequently proves to have been unjustified, he (or she) may become the deserting party. This situation, again, arises from the legal view that "desertion" consists of two elements—the *act* and the *intention* of deserting. (*See also* (**b**) (**v**), above).

An *honest and reasonable belief*, by one spouse, that the other spouse has committed, or is committing, adultery, if such a belief is induced by the other spouse's conduct, may be "just cause" for the first spouse to refuse cohabitation, and prevent him (or her) from being regarded as the deserting party.

(c) *Cruelty* is not defined by statute, but has been decided, in reported cases, to mean conduct causing danger to life, limb, or bodily or mental health, or giving rise to a reasonable apprehension of such danger. (The term "Mental Cruelty" is unknown to English law; but there may be *cruelty* in the legal sense *without physical violence.*) The Courts have refused to commit themselves to a comprehensive definition; *every case* must be considered on its *own facts* in the light of the whole history of the marriage. One single act, even of violence, can seldom be regarded as "cruelty"; but the conduct complained of must be of a *grievous nature*—not mere conduct which (however reprehensible) may be regarded as "part of the wear and tear of married life." In order to constitute cruelty, the conduct must be understood to be likely to break the latter's *health or spirit.* An *insane person*, who does not understand the nature and quality of his acts, and so cannot form the necessary "intention" (*see* **D8**), *can be guilty of cruelty* if he was warned of the probable result; for it is no longer necessary for the petitioner to prove that the respondent *intended* to be cruel or was aiming or directing his conduct against the petitioner.

Drunkenness, in itself, is *not* cruelty; but if it is so *persistent*, or its effects so inevitably *distressing* to the other spouse, as to *threaten his or her health*, it may amount to cruelty. Similar considerations apply to persistent refusal of sexual intercourse, excessive sexual demands, or sexual malpractices either forced upon the other spouse or committed with third parties.

A *divorce petition* based wholly or partly on cruelty must *set out specifically the acts* complained of, evidence of which is to be given at the trial. (This ensures that the Respondent knows the details of the case he has to meet.)

(c) **Restitution of Conjugal Rights.**—Either spouse may petition the Court for such a decree where the other spouse has "wrongfully withdrawn from cohabitation" (see above). *Willingness to return* to cohabitation, *if genuine*, or *proof of just cause* (see above) for refusal are good defences. If the petition succeeds, and the Court orders the erring spouse to return, his or her *non-compliance* with the order *will not lead to enforcement* by arrest or otherwise; but it will (so to speak) fix upon him or her responsibility for the separation, and *establish* his or her status as the deserting party (see above). And *non-compliance* with a restitution decree is in itself *a ground* for the
other party to petition for a decree of *judici*
separation (see below).

(d) **Judicial Separation.**—A petition for th
form of relief may be presented by either spou
on the ground last mentioned in the foregoi
paragraph, or on any of the grounds for which
divorce petition (see above) might have been pr
sented. The *effect of the decree* (as in the case of
similar order made by a Magistrates' Court)
that the Petitioner is *no longer bound to cohabit* wit
the Respondent, and cannot therefore be regarde
as a deserting party. (The *legal bond* of marriag
remains in force; the procedure is therefore ofte
employed by a spouse who does not desire divorc
perhaps for reasons of conscience, perhaps merel
so as not to allow the other party freedom to marr
somebody else.) It is, however, open to a Pet
tioner, who has obtained a decree of judici
separation, to petition for divorce, on the sam
facts, at a later date—*provided that three yea*
have elapsed since the date of the marriage (s
D27 1)).

Bars to Relief.—(1) *Absolute Bars.*—It is, b
statute, the duty of the Court to investigate, so fa
as it reasonably can, the facts alleged in an
petition for divorce or judicial separation, and t
inquire whether there has been any *connivance*
condonation on the part of the Petitioner, an
whether any *collusion* exists between the partie
The Court must dismiss the petition, and *refuse*
decree, even in an undefended suit, unless it is sati
fied: (*a*) that the *Petitioner has proved his or h*
case; (*b*) that the Petitioner has not been *accesso*
to or connived at the adultery (if any) of the oth
party; (*c*) that the Petitioner has not *condone*
the adultery (if any) or the cruelty (if any) of th
other party.

(a) *The Petitioner must prove the case*—that is t
say, satisfy the Court that there are *proper groun*
for a decree *according to law*; there is no such thin
in suits for divorce and judicial separation,
judgment by consent, by admission, or in defau
of defence (as is possible, for example, in actio
for breach of contract (**D11**) and tort (**D12**)).
matrimonial suits the *State*, and not merely th
parties themselves, must see that the provisio
of the law are *strictly observed*.

(b) *There must be no connivance*—that is to sa
the Petitioner must not have intended *to promo*
or encourage or provide opportunity for the com
mencement or the continuance of the Respondent
adultery. Merely *keeping watch upon a suspect*
spouse, for the purpose of obtaining evidence,
not necessarily connivance; there must be activ
encouragement or acquiescence—wilfully "shuttin
one's eyes" to what is going on or likely to tak
place. (But, if a spouse who has connived at h
partner's adultery repents and withdraws h
acquiescence, the connivance may be regarded
"spent," and no longer be a bar to divorce.)

(c) *There must be no condonation* of adultery
cruelty—that is to say, *forgiveness* of all such ac
as are known to, or suspected by, the injure
spouse, and the restoration of normal marital rel
tions with the offending spouse. ("Forgiveness
means forgiveness *on condition* that there shall
no further matrimonial offence.) Condonation ma
be by words or conduct. The Petitioner *cann*
obtain a decree on the ground of any offence
offences which he or she has *condoned*, except
case of *revival*. But adultery or cruelty shall n
(now) be deemed to have been condoned merel
because of a resumption of cohabitation (for n
more than three months) with a view to reco
ciliation.

Revival—If, subsequent to the condonation, th
offending spouse again commits some matr
monial offence or offences, the former offence
offences, other than adultery, are *revived*—*i.e.*, th
effect of the forgiveness and restoration (see abov
is cancelled, and the former offence or offences w
again afford a ground for divorce or judicial separ

It does not matter whether or not the new ce is of the same nature as the old; condoned ty will be revived by new acts of cruelty or tion; condoned cruelty will be revived by a act of adultery, and so forth. But, by the of 1965, adultery, once condoned, cannot be ed.

Discretionary Bars—(*a*) *There may be an ment* or *bargain* between the parties (whether nancial consideration or otherwise) that the ioner will commence or conduct a suit for ce or judicial separation, or that the Re- dent will not defend such a suit. There is *sion* if one party *requests or suggests* that the *should commit adultery* in order to provide nce for a divorce, and the other party *es* to the request or suggestion. But it is necessarily collusion for the Petitioner, ing that *adultery has already been committed*, k the other party *for details or for evidence* on h the Petitioner can act. The Court regards cial arrangements between the parties with cion, if they are entered into *before the suit is enced*, and it will carefully investigate such gements, and it has a discretion, under the Act, to permit such financial arrangements if are fully disclosed. Once the petition has filed, there is no objection to discussion, een the parties or their advisers, of necessary cial arrangements as to alimony or main- nce (*see* **D30**(**1**)) or the disposal of the imonial home.

Apart from connivance and condonation, r of which (as we have seen) is a *bar* to the ing of a decree, the *Court has a discretion to refuse or to grant* a decree of divorce or ial separation, according to circumstances, if ds that the *Petitioner* has himself (or herself): een *guilty of adultery* during the marriage; *shown unreasonable delay* in presenting or cuting the petition; or (*iii*) been guilty of ty, or desertion without reasonable cause, the Respondent's acts of adultery or cruelty hich the petition is based. The Court has a ar *discretion*, where the ground for the petition *ltery*, *desertion*, or *unsoundness of mind*, either fuse or to grant a decree to a *Petitioner* who *iv*) been guilty of such *wilful neglect or mis- ct* as has conduced to (*i.e.*, helped to bring) the Respondent's adultery, desertion, or ndness of mind; and (*v*), by the 1965 Act, a discretion to grant a divorce where there een an agreement between the parties, if full sure is made (*see* (**a**) above).

a case where each party is asking for a divorce st the other, each admitting his (and her) misconduct and asking the Court to exercise iscretion in his (and her) favour, the *Court exercise its discretion in favour of both* and ve the marriage. The same applies to *y*.

case (*i*) above, where the *Petitioner* has him- or herself) been *guilty of adultery*, it is the oner's duty to lodge in the Divorce Registry *retion statement*—*i.e.*, a written statement in led envelope (to be opened by the Judge hearing) admitting the facts and explaining ircumstances of his (or her) adultery. The *on* in such a case must *contain a clause ng the Court* "to exercise its discretion in the oner's favour." The Petitioner's *own* ery, admitted in open Court, may be the uch evidence available.

ree Nisi and Decree Absolute.—When the comes on for trial the Judge will hear the *ce of the Petitioner* and his or her witnesses, *gal argument* on his or her behalf; *if the case ended* by the Respondent spouse, or by the pondent (*i.e.*, any *man* accused, in the peti- of adultery with a Respondent *wife*), or by *oman named* in the petition as having com- adultery with a Respondent *husband*, the will hear their evidence and legal argument eir behalf. The Judge, if not satisfied on points (*a*), (*b*), and (*c*), (**D28–9**) in a case of divorce or judicial separation, must *dismiss the petition*, in which event the married status of the parties will remain unchanged. If the Judge *is* satisfied on the points mentioned he will, in a suit for *judicial separation*, pronounce a *final decree*; in a *suit for restitution of conjugal rights* he will *order* the deserting spouse to *return to cohabitation* (the effect of the decree and the order is described above, **D28**(**1**)).

In a suit for *nullity* or *divorce*, the Judge will pronounce a decree *nisi*—*i.e.*, an order that the marriage is to be *annulled* or *dissolved* unless (*nisi*), before that event takes place, *some cause* is shown to the Court *why final annulment or dissolution ought not to be permitted*. Intervention for this purpose may be made by an official known as the *Queen's Proctor*, or by any member of the public. Such interventions after decree *nisi* are rare, but may be made on the ground, for example, that there was a collusive arrangement (see above) which was not disclosed, or some other material fact, which was concealed from the Court at the hearing.

If such intervention succeeds, the decree *nisi* will be *rescinded* (*i.e.*, cancelled) and the parties will retain their former status. If there is *no such intervention*, or if such intervention is *dismissed*, then the marriage will be *finally annulled or dissolved* on application (on a special form), at the Divorce Registry concerned (not in open court), by or on behalf of the *Petitioner*, not earlier than *three months* after the decree *nisi* (unless the Court fixes a shorter time by special order). If the Petitioner does not make such an application, then the Respondent may do so after the lapse of a *further three months* (*i.e.*, six months after the date of the decree *nisi*), and the Court has power to grant or refuse such application or to deal with the case as it thinks fit.

The decree which *finally annuls or dissolves* the marriage is called a *decree absolute*. Unless and until it is granted, the marriage tie still subsists; the decree *nisi* does *not* terminate the status of husband and wife. But the *decree absolute* does terminate that status, leaving both parties free to marry again.

Incidental Matters

(1) Custody and Maintenance of Children.—Apart from the general power of the Chancery Division, as guardian of equity (**D5**), *to protect the person and the property of any infant* (**D7**) and of the Local Authority under the Children and Young Persons Act, 1963, (even though there may be no matrimonial proceedings between its parents), and apart from the additional powers of that Division and of Magistrates' Courts, under the Guardianship of Infants Act, 1925, *to appoint a guardian or guardians for any infant*, and to make orders for either parent to have *access* to the infant (*i.e.*, to see it periodically) and for the infant's *maintenance*, the Divorce Division itself may make orders for the *custody*, *maintenance*, *and education* of the *children of the family* (*see* **D31**(**1**)) in any matrimonial proceedings, and give directions for placing them under the protection of the Court, and for access to them by either or both of the parents. The expression "children of the family" includes children lawfully adopted by both husband and wife, children of a bigamous "marriage" which has given rise to nullity proceedings (**D25**), and also children born before the marriage of their parents and legitimated by that (subsequent) marriage. The Court may make such orders and give such directions at any time after proceedings have been commenced for nullity, divorce, judicial separation, or restitution of conjugal rights; it may make interim orders, and give interim directions, from time to time *during the proceedings*. It is, however, *unusual* for the Divorce Division to make orders for custody of or access to any child *over the age of sixteen* (since such orders would be difficult to enforce). (*See also* **D31**(**1**) for recent changes in the law.)

In all such proceedings, in *whatever court* they may be taken, the *paramount consideration* is the *welfare of the children—not the punishment of the "guilty" parent, nor any privilege* of the father as against the mother, or *vice versa.* (It is, for example, unusual for the Court to deprive the mother of the custody of a very young child, even though she has committed or is living in, adultery —unless, or course, she is neglecting the child or is a "bad mother" in the widest sense.) In some cases, for good reason, both parents may be passed over, and the custody of the child may be given to some third party.

(2) **Financial Provision.**—(a) *Alimony Pending Suit.*—On any petition for nullity, divorce, judicial separation, or restitution of conjugal rights, the Divorce Division may make such *order* for *payment by the husband to the wife* of *alimony pending suit* (*i.e.*, a periodical sum for or towards her support *during the proceedings*) as the Court thinks just. The Court may also *order a wife Petitioner*, in a suit for divorce or judicial separation on the ground of the *husband's insanity*, to pay *alimony pending suit* for or towards the *support of the husband during the proceedings.*

(b) *Permanent Alimony* is the term used for similar payments which the Court may order the husband to make to the wife *after* the pronouncement of a *decree of judicial separation* on any ground, and such an order *in favour of the wife* may be made even where a decree has been pronounced *against her*. An order for *permanent alimony* may also be made *in favour of the husband* in a case where the *wife petitioned* for judicial separation on the ground of *his insanity*. *Permanent alimony* may also be ordered in favour of the wife where an order for *restitution of conjugal rights* has been made in her favour.

(It will be observed that, in all the above cases, the period during which the payment of *alimony* may be ordered is *while the status of marriage remains in being.*)

(c) *Permanent Maintenance* is the provision which the Court may order the husband to make in favour of the wife *after a decree absolute* of *divorce or nullity*—*i.e.*, for the period *after the married status has been terminated*. (The Court may, *in exceptional cases*, make an order for *permanent maintenance* in favour of a "guilty" wife.) In *one case permanent maintenance* may be ordered *against a wife* and *in favour of a husband*—where the *wife petitioned* for divorce on the ground of *his insanity*. The order may be for payment of a *monthly or weekly sum* during the *joint lives of the parties* (*i.e.*, so long as they shall *both* live), or for a capital sum to be invested so as "to secure to the wife such lump or annual sum of money, for any term not exceeding her life," as the Court thinks reasonable, in both cases having regard to "*her fortune* (if any), to the *ability of the husband*, and to the *conduct of the parties*." The amount of the order is therefore left to the *discretion of the Court*; and it may be varied by the Court from time to time as the circumstances of the parties change. (The words "conduct of the parties" show that, in fixing the payments, the Court does not necessarily regard the question of "guilt" or "innocence" as clear-cut on the one side or the other; it may take into consideration the *whole history of the marriage*. The Court also takes into account the *property and income* of *both parties*.) (*See also* D32(1)). The Court may also order the husband to pay a reasonable lump sum to the wife.

(d) *Periodical Payments* may be ordered to be made, *by the husband to the wife*, on or after the making of a *decree for restitution of conjugal rights*, for the joint lives of the parties. The Court may order the husband to "secure" such payments as in the case of permanent maintenance. Where the *husband successfully applied* for the decree, the Court may order the wife, if she is "in receipt of any *profits of trade or earnings*," to pay to the husband, or for the benefit of the children, such part of those profits or earnings as it thinks reasonable. *See also* D32 (D *and* E).

Where a husband has been guilty of *wilful ne lect to provide reasonable maintenance* for his wi or infant children, then, in any case where th wife might have petitioned for judicial separatio the Court may (on the wife's application) orde the husband to make to her such *periodical pa ments* as may be just, and it may order the hus band to "secure" such payments (as describe above). (Thus, where there has been wilfu neglect to maintain, on the part of the husban the wife may apply for financial relief in th Divorce Division instead of in the Magistrates Court; there is *no limit* in the Divorce Division t £7 10s. a week, as there is in the Magistrates' Cour (D24 2)). And the wife may make such an appli cation even if she does not wish to petition for decree of nullity, divorce, judicial separation, o restitution of conjugal rights.)

(e) In any case where the Court has power t make a *permanent* order, it may now order th payment of a *lump sum* (1965 Act).

(f) *Settlements.*—In any case in which the Cour pronounces a decree for divorce or judicial separa tion by reason of the *wife's adultery, cruelty, o desertion*, the Court has power to order the wife' property, or any part of it, to be *settled* (D20) fo the benefit of the innocent party, or of th children of the marriage, or both.

The Court also has power, after a decree fo nullity or divorce, to vary the terms of any settle ment which may have been made on the partie before or after their marriage; the variation ma be made to benefit the children, or the parties o either of them, as the Court thinks fit.

(g) *Damages against Co-respondent.*—A husban who is petitioning for a decree of *divorce o judicial separation*, on the ground of his *wife' adultery*, may ask for an award of *damages again the Co-respondent* (*i.e.*, the man with whom sh has committed adultery). Such a claim, which comparatively rare nowadays, is usually trie before a judge and jury; the damages should b assessed so as to *compensate the husband*, so far possible, for the loss of his wife where she has bee seduced from his side by the adulterer.

(h) *Costs.*—The costs of the proceedings ar *always in the discretion of the Court*, each case de pending on its own facts. Generally speakin however, the costs "follow the event"—*i.e* when a decree or order is made against a husban he will usually be ordered to pay the costs in curred; costs, however, are rarely awarde against a "guilty" wife, but are not infrequentl ordered to be paid by the Co-respondent (if any An order for costs may be made, but rarely against the "woman named" in a petition having committed adultery with the husband.

Note on Domicil.—It has been explained abov (*see* D7) why the English Court will *not, generall speaking*, grant a *divorce* to a man who is *domicil abroad*. Since the *domicil of a wife* is the same *that of her husband* (even if she has not lived wi him for many years), the refusal of the Englis court to accept jurisdiction has caused hardsh in many cases. To mitigate this hardship th Matrimonial Causes Act, 1965 confers upon th Divorce Division an additional statutory jurisdi tion in the following cases, *in favour of a wife*, eve if her husband is *not domiciled in England*:

(*a*) In *any* matrimonial proceedings, *other th* for a "decree of presumption of death and dissol tion of marriage" (see below), if: (i) the wife h been deserted by her husband, or the husband h been deported from the United Kingdom as alien; and (ii) immediately *before the desertion deportation* the husband *was* domiciled in Englan

(*b*) In proceedings for *divorce* or *nullity*, if: the wife is *resident* (*i.e.*, actually living for t time being) in England; and (ii) has been *ordinar*

ent there for a period of *three years* immedi-
r preceding the commencement of the pro-
ings; and (iii) the husband is *not* domiciled
ay other part of the United Kingdom, or in the
anel Islands or the Isle of Man. (The two last-
ed territories have their own separate systems
w.)

In proceedings for a decree of " presumption
leath and dissolution of marriage ": the
and is presumed by law (*for the purpose of*
taining the wife's domicil) to have died
mediately after the last occasion when she
, or had reason to believe him, to be living."
s the wife can acquire an English domicil of
own as from that date.)

nd, under the Matrimonial Causes (War
riages) Act, 1944:

In the special case of *marriages celebrated*
ng the Second World War, where: (i) the
and was, at the time of the marriage, domiciled
de the United Kingdom; (ii) the *wife* was,
ediately before the marriage, *domiciled in*
and; and (iii) the parties *never resided*
her in the country which was the husband's
icil at the time of the marriage, the Divorce
sion may deal with proceedings for divorce or
ty *as if both parties* were at all material times
ciled in England. (This provision was to
r the special cases of soldiers from the
inions or Colonies, the United States or other
gn countries who, while stationed here during
War, married English girls and had to go back
eir own countries, *leaving their wives behind*—
me instances without communicating with
again.)

RECENT CHANGES IN THE LAW

rtain important changes in the law have been
ed by Acts of Parliament in 1958 and 1965:

1. In any agreement for maintenance made
een spouses, without recourse to a Court, any
iction against applying to a Court for changes
nancial arrangements is void, but the other
sions are valid and enforceable. " Financial
gements " mean provisions governing rights
liabilities towards each of the spouses while
apart, including cases where the marriage
be dissolved or annulled, and rights and duties
ding the maintenance of a child of the family.

Where there has been a change of circum-
es since the agreement was made, causing
sions to have been committed or omitted, or
e the agreement does not make proper pro-
n for the children, the High Court or a
strates' Court may vary or revoke those
es and insert others which appear to the
to be just. (A Magistrates' Court, however,
nly bring the maintenance up to £7. 10*s*. a
for a spouse and £2. 10*s*. for a child, and only
party resides in the court's area).

Neither 1 nor 2 (above) precludes the right
her spouse to apply for an order containing
ncial arrangements " under some other Act.

Where a maintenance agreement provides
ntinuing payments after the death of a party
lies after 16 August 1957, the surviving party
within six months from probate or letters
ministration (D18(2)) or, with the Court's
at any time before the estate is fully
nistered, apply to the High Court for an
under 2 above. The legal personal repre-
tives (D18(2)) are not liable for distributing
tate after the expiration of the six months
ut taking these provisions into account; but
rviving spouse is not precluded from claim-
om the beneficiary.

These provisions do not apply to any sum
le under a maintenance agreement made
17 August 1957; and 1 (above) does not
unless at least four-fifths of the estate is left after providing for funeral and legal expenses and debts, and no liability falls upon the legal personal representatives.

B.1. The powers of the Divorce Division to provide for the *custody, maintenance, and education of the children* of the family (D29(2)) are enlarged to apply also to a *child of one of the parties* (including an *illegitimate* or *adopted* child) " who has been accepted as one of the family by the other party," as they apply to a child (whether legitimate or illegitimate) of *both parties*. All such children are referred to as " children of the family ".

2. Where a husband has been *guilty of wilful neglect to provide reasonable maintenance* for his wife or infant children (D30(2)), enabling the Divorce Division to order the husband to make *periodical payments* to the wife, the words " infant children " are to include any *illegitimate child* of *both* parties, and the Court may make orders for *custody of and access to* (D29(2)) any such children. If the Court considers it in the *child's best interests*, it may order the periodical payments for the child's benefit to be made *to the child* itself, or *to some other person* on the child's behalf, instead of to the wife (D30(2)).

3. The same Act contains further enlightened and much-needed reforms for the *protection of the children* in matrimonial proceedings (whether defended or undefended). The Court, generally speaking, is *not* to pronounce a decree of *judicial separation* (D28(2)), or make *absolute* any decree for *divorce or nullity* (D29(2)), unless and until the Court is satisfied *either*—

> (*a*) that arrangements have been made for the *care and upbringing* of every such child under 16, and that such arrangements are satisfactory or the best that can be devised in the circumstances, *or*
>
> (*b*) that it is impracticable for the party or parties appearing before the Court to make any such arrangements.

But the Court *may* proceed without observing these requirements if: (i) there are *special reasons* against delay, and (ii) either or both of the parties have given to the Court a *satisfactory undertaking* to bring the question of such arrangements for the children before the Court within a specified time. The Report of the Committee set up by the Archbishop of Canterbury (D27(1)) would refuse a decree *nisi* (D28(2)) until satisfactory arrangements for the children are made.

4. On any application to the Court for *special leave* to present a divorce petition *within three years from the date of marriage* (D27(1)), the Judge must consider, not only the *possibility of a reconciliation* between the parties and the *interests of the children of the marriage* (which was his duty under the Act of 1950), but also the interests of any child referred to in para. A1, above.

5. Even if proceedings for divorce, nullity, or judicial separation are *dismissed*, the Court may still make provision for the custody, maintenance and education of any child referred to in para. A1 above, and may vary such orders from time to time.

6. Finally, the Court is given power, in exceptional circumstances, to commit the care of any such child *either*: (i) to a *county council* or *county borough council*, *or* (ii) to an *independent person* under the *supervision* (if the Court think fit) of a *welfare officer* or of a county council or county borough council. Further powers are conferred on *Local Authorities* by the Children and Young Persons Act, 1963.

C.1. The words " continuously under care and treatment " (in relation to a spouse of unsound mind) (D27(1)) are to be interpreted *more liberally and more broadly* (in various ways) then has been the practice of the Court in the past.

2. A person who has *deserted* his or her spouse and is now of *unsound mind* may be regarded (for the purpose of divorce or judicial spearation) as *capable of forming the intention of continuing* the desertion, if the Court takes the view that the "deserting" party would in any event have stayed away (even if no unsoundness of mind had supervened). (*Note.* Hitherto the Petitioner has faced almost insuperable difficulties in such cases, since it is not normally possible to attribute to a person of unsound mind the capability of forming any "intention" whatsoever (D8(1)). *See also* Cruelty—D27(ii) (c), and D28 (c).

3. Where the Petitioner is seeking *divorce* on the ground of the Respondent's *desertion* without cause for at least *three years* preceding the presentation of the petition (D27(1)), any *agreement for separation* (whether in writing or not), entered into before *1st January 1938*, shall be *disregarded* by the Court if either: (*a*) the Respondent *had already deserted* the Petitioner, or (*b*) the Court is satisfied that the *circumstances* in which the agreement was made would have amounted to desertion (*without cause*) by the Respondent but for the Petitioner's apparent consent, in the agreement, to a separation.

(*Note.* Desertion did not become a ground for divorce until *1st January 1938.* Some deserted spouses may have entered into separation agreements, inadvertently, *before* that date, and this provision is intended to mitigate hardship where there was (at that time) a genuine case of desertion but the case was ruined by the signature of a written agreement to live apart, or by some form of spoken words or conduct, on the part of the deserted party, appearing to signify consent to the separation.)

D.1. Maintenance Orders *made by the High Court* (or a County Court) may be *registered in a Magistrate's Court*, which is given power to *vary* and to *enforce* such Orders. Maintenance Orders *made by a Magistrates' Court* may be *registered in the High Court*, which is given power to *enforce* such Orders. (The purpose of such registration is to make enforcement more easily effective; in some cases it may be more convenient for the wife to resort to High Court procedure; in others to proceed in the Magistrates' Courts.)

2. If the spouse (usually the husband) liable for payments under a Maintenance Order is a person *in employment*, and if his maintenance payments are at least four weeks *in arrear*, then the Court may make an *Attachment of Earnings Order*. This Order will *authorise and direct his employer to deduct from his earnings* certain sums (which the Court will specify), to be handed over *by the employer* to an official of the Court, who will pass them on to the wife as instalments towards the payment of: (*a*) the arrears, and (*b*) the amounts currently falling due under the original Maintenance Order. (*Note.* Hitherto the Courts have had no power to compel employers to collect such payments out of the defaulting husband's earnings; the wife's only remedy has been to ask for an order committing the defaulting husband to prison—a procedure which gave her *no financial redress* or assistance.)

The *Attachment of Earnings Order* will also specify the "protected earnings rate"—*i.e.*, the rate below which the Court thinks the defaulting husband's earnings should *not* be reduced by virtue of the authorised deductions. (*Note.* In other words, the Court will see that the defaulter is left with a reasonable part of his earnings to live on.)

E.1. The Court is given power to make an order against the Respondent (D27(1)) for financial provision (D30 (1)) in favour of the Petitioner (D27(1)) or the children, *either* at the time of the decree *nisi* (D29(1)) *or* at any subsequent date; but the Court is not to disregard any delay on the part of the Petitioner in applying for such financial provision.

2. The Court is given power to set aside (*i.e.*, cancel the effect of) any disposition of property by a Respondent husband (or former husband) i favour of some third party, if that disposition o property has been made within the past thre years (preceding the Petitioner's application fo financial provision), and seems to have been mad with the intention of defeating or frustrating th Petitioner's application. But no such dispositio of property is to be set aside if it was made *fo valuable consideration* in favour of a *person wh acted in good faith* and without knowing of th Respondent's intention to defeat or frustrate th Petitioner's application. (*Note.* This will enabl the Court to protect a wife, in certain circumstances, if the Respondent husband (or forme husband) has (for example) transferred part of hi property to his mistress, with the intention o defeating his wife's claim to maintenance, alimony *etc.* Up to now the Court has had no power t remedy such action by a husband who has mad a transfer of the kind *prior to* a Court Order fo maintenance, *etc.*) *See also* Lump Sum order D30 (e), and Matrimonial Causes Act 1965 (below

3. The power of the Court to order "reasonabl provision for maintenance" out of the estate of deceased person (D16 2)), in a case where his wil or intestacy does not leave his wife "reasonably provided for, is now extended to benefit a *forme wife* (*i.e.*, "a woman whose marriage with hi was during his lifetime dissolved or annulled." (*Note.* This definition is not limited to a forme wife who was the "innocent" party in divorc proceedings; but the Court has a discretion t make or refuse the order, taking all the circumstances into account.) Such an order may b discharged, varied, suspended or revised at th suit of various interested parties.

4. The Court's powers under paras. 2 and (above) are extended to protect: (*a*) a *forme husband* whose former wife has divorced him, o obtained a judicial separation against him, on th ground of *his insanity* (D27(1)), or (*b*) where th Court has ordered a settlement of the wife' property, or "periodical payments" out of he income, where there has been a decree for restitution of conjugal rights (D28(1)).

5. The executors or administrators (D18 (2)) o the deceased spouse are not to be liable if, whe a claim under para. 3 is made, they have alread distributed the deceased's estate (provided the waited for 6 month after the Grant of Probat or Letters of Administration (D18 2)); but th claimant under para. 3 can follow the propert into the hands of a beneficiary and recover it (i it is still available) by means of an order unde para. 3 (above).

6. Under the Married Women's Property Act 1882, the Court was given power to decide in *summary manner* (*i.e.*, by a rapid and simpl procedure) disputes between any husband an wife about the *ownership of any property.* Tha power is now extended to cases where the respondent spouse *has been, but no longer* is, in contro of the property, or the *claimant does not kno* whether it is still in the respondent's control o not. The Court may order the necessary enquiries to be made; in appropriate cases it ma also order property in the hands of the respondent or of a third party, *to be sold*, so that the claiman may have his or her share paid out of th proceeds.

F. The Court is given power to grant an injunction against any person who appears likely to dispose of property so as to defeat any of the provisions of **E** (above) or to transfer such propert abroad.

G. If any question arises as to the right of husband or wife to money derived from an allowance made by the husband for housekeeping or any similar expenses, or to any property acquired out of such money, the money or propert (in the absence of agreement to the contrary) sha be treated as belonging to them both in equa shares. (The old rule was that the wife's saving out of housekeeping allowances belonged to th husband.)

TATUTORY REFORMS IN LAW OF LANDLORD AND TENANT

Business Tenancies

Inder the Landlord and Tenant Act, 1954,
t II (and cases decided under it) *security of*
ire is granted (under certain conditions) to a
ee or under-lessee who *occupies premises for the*
pose of a trade, business, profession or employ-
t carried on by him on the premises. (We
l refer to such premises as "*the holding*".)
holding may not be used as business premises,
there is no security, if the lease or tenancy
eement prohibits their use as such, unless per-
sion has been given by the lessee's (or under-
ee's) landlord to that effect. *Tenancies ex-*
led from protection include agricultural hold-
, mining leases, on-licensed premises (except
ain hotels and restaurants) and tenancies not
eeding three months, unless the tenant and the
son who carried on the same business there
ore him have occupied the premises for more
n six months altogether.

holding is protected by the Act by the pro-
on that the *tenancy does not automatically come*
n end on the date specified in the original lease,
only (i) *if the landlord gives to the tenant not less*
i six nor more than twelve months notice in
ing to terminate the tenancy; (ii) *if the tenant*
s to the landlord, within a similar period, a
est for a new tenancy; (iii) where the tenancy
r a *fixed period*, if the *tenant gives at least three*
ths notice (expiring at the end of the period or
any quarter day afterwards) *that he does not*
t the tenancy continued; (iv) if it is a *periodic*
ncy (from month to month or year to year),
tenant gives the landlord notice to quit, of the
legal length; (v) if the tenancy is *surrendered*
vi) if the tenancy is *forfeited* (which can be done
he landlord only on a Court application). In
s (*i*) *and* (*ii*), the *parties may agree* to fresh
ns for a new tenancy. It is *vital* in such cases
the *time-table* laid down in the Act shall be
ered to, and the *advice of a solicitor* should be
ght *at least twelve months before the end of the*
e; if any request or application is out of time,
Court cannot help the party in question. The
lve months or six months *notice of termination*
above) *must not expire* earlier than the date of
ry of the original lease.

Vhere (i) the landlord serves the notice of
nination: (*a*) it must require the *tenant,*
in two months of the notice being given, *to*
fy the landlord whether or not he is willing to
up possession on the specified date; (*b*) it must
e *whether or not the landlord will oppose an*
lication to the Court for a new tenancy, and if
n what grounds. Four of the grounds are that
tenant has neglected repairs or payment of
for which he is liable or committed some other
ch of his lease, or that the landlord has offered
onable alternative accommodation. Three
her grounds are: (*e*) that the existing tenancy
underlease of part of premises held under the
l lease, and the separate lettings would produce
wer total rent than if the whole were let to-
er; (*f*) that on the termination of the current
ncy the *landlord intends to demolish or recon-*
t the holding or a substantial part, and could
reasonably do so without obtaining possession
e whole; (*g*) finally, that on the termination
he current tenancy, *the landlord intends to*
py the holding for the purposes of a business to
arried on by him, or as his residence. (But the
lord *may not oppose* the grant of a *new lease*
is final ground if his interest was purchased or
ted within *five years* immediately preceding
termination of the lease.)

the *tenant* prefers *to request a new tenancy*, he
t propose to the landlord that it shall com-
ce not more than twelve nor less than six
ths from the date of request; but the com-
cement must *not be earlier than the date of*
y of his existing lease. The tenant must also
ose the period of the new lease, the rent he is
ng to pay and the other particulars of the
osed new tenancy. The tenant cannot make
request (*a*) if the landlord has already served
mination notice, or (*b*) if the tenant has served
e to quit; nor can either (*a*) or (*b*) take place
the tenant's request for a new tenancy.

Within two months after the tenant's request, the landlord must serve on the tenant notice stating on which of the above grounds (if any) he will oppose the Court's grant of a new tenancy. The parties cannot make any agreement to the effect that the Act shall not apply.

The next step is for the *tenant, not less than two months nor more than four months after the landlord's termination notice or the tenant's request* for a new tenancy, *to apply to the County Court*, which *must grant him a new tenancy* on such terms as the parties may agree on or the Court thinks fit, unless the landlord establishes any of the above grounds of objection. If the *landlord's objections are false*, the Court will grant the tenant *damages*.

If the landlord establishes any of grounds (e), (f) or (g), so that the Court cannot grant a new tenancy, the Court orders the *landlord to pay to the tenant compensation for disturbance*. If the tenant has carried on *business* on the holding *for the whole of fourteen years* preceding the termination, the compensation is *twice the net rateable value:* if for a *lesser period, a sum equal to the rateable value.*

If the above procedure is carried out, the *old lease continues* in effect *until the final disposal of the case*, even if the lease has expired meanwhile. "*Final disposal*" includes any necessary *time for appeal.*

(2) Residential Tenancies

Under the Rent Act, 1965, *security of tenure* is provided for *tenants of dwellings* with *rateable value* (*a*) *up to* £400 a year in the *Metropolitan Police District* and £200 *elsewhere* (including (*b*) those still controlled by the old Rent Restriction Acts 1920 to 1939, which now apply only to very small and low-rated dwellings.) The Act imposes a *standstill on present rents* (except variations of rents including rates, cost of services and owner's improvements). *Rent officers or assessment committees* will be set up *to revise rents* in category (*a*). The protected tenancies under (*a*) are called "regulated tenancies". Certain *statutory tenancies of formerly requisitioned dwellings* (which would have *expired on March 31, 1966*) are continued after that date as regulated tenancies. *Occupiers who are not tenants* (*i.e.* those in occupation *necessarily because of their employment*, such as caretakers) *are included* under the term "tenants".

The task of the *rent officers and rent assessment committees* is *to fix fair rents* on application of landlord or tenant, or both, in counties, county boroughs, London boroughs and the City of London. They are *to take into account all the* circumstances, age, character, locality and state of repair of the dwelling; but *disrepair due to the tenant's neglect* and *improvements by the tenant* are to be *disregarded*, as is *also* any *great demand* (*exceeding supply*) *of dwellings in the district.* The fixed rents are to be registered, and must *include payments for furniture and services* (*if any*). *If the landlord pays rates*, that fact is to be noted, and the *registered rent plus the rates may be recovered from the tenant.* If the cost of services, or of repairs to be done by the landlord, is a variable sum, the registered terms must say so. The landlord cannot lawfully recover more than the registered rent, taking the above variations into account.

It is *unlawful for any person* (with intent to *cause the residential occupier* to *give up occupation* or to refrain from pursuing his rights or remedies) to do anything calculated *to interfere with his peace or comfort* or *persistently to withdraw or withhold services* reasonably required for occupation. "Residential occupier" means a person occupying the premises as a residence, either by contract or by any Act of Parliament. The penalty is a fine up to £100 or imprisonment up to six months or both, before the magistrates, for a first offence, and a fine up to £500 or the imprisonment, or both, for a subsequent conviction. The *occupier*, even if the premises are not "protected" (*i.e.*, not subject to the Rent Restrictions Acts or certain other statutes) *cannot lawfully be evicted even* when the tenancy has terminated and the occupier continues to reside there, *without leave of the Court. In default,* the owner is liable, on conviction before the magistrates, to a *fine up to £100 or six months' imprisonment or both*—unless he can prove that he reasonably believed that the occupier had ceased to reside in the premises. *Occupiers protected* are the tenant or *former tenant,* a lawful *subtenant,* and the widow or widower, or any member of the family of either, residing with the occupier at his death.

The demand for or taking of a premium as a condition of the grant, renewal, continuance or transfer of a *protected tenancy* (in addition to the rent) *is forbidden* (except in case of expenses, paid by the outgoing tenant, for a period after the transfer, or improvements he has paid for, or as a refund to the outgoing tenant of any reasonable premium which he himself paid on taking posession, or (if part of the premises are business premises) for goodwill transferred to the incoming tenant.) There are also *restrictions on the demand for, or taking of, a premium in relation to a "regulated tenancy"*; broadly speaking, a premium is lawful only if the tenancy or its continuance is for more *than seven years*—and then only if the registered rent is higher than the rent payable under the tenancy.

There are wide provisions regarding the protection of occupiers of furnished dwellings and regarding mortgages. As the Act of 1965 has only recently come into force, there is little case law on the subject, and legal advice should be sought.

(*Note*: The Queen's Speech (Nov. 1965) foreshadowed the introduction of legislation to reform the leasehold system for residential property (D21)).

CRIME AND PUNISHMENT IN A CHANGING SOCIETY

It is a melancholy reflection that man is not naturally benevolent or tolerant towards his fellows: that humanitarian conduct is not necessarily associated with theological dogma, cultural values, or political progress, and is seldom induced by admonition or moral exhortation. In particular, we may consider the comparative lack of humanising influence, from ethical Christianity or parliamentary democracy, upon the punishment of criminals. It is only when the scientist and the philosopher begin to speculate upon and seek out the sources of conduct which fills the ignorant with horror and disgust that it becomes possible to persuade the ordinary man that such conduct is not a perverse form of wickedness, calling for passionate condemnation and savage repression, but a symptom, calling for investigation, of a deeper disorder which must be scientifically diagnosed, its causes traced and treated, unemotionally and impersonally, with a view to their mitigation or removal.

The Growth of Research.—Much the same, or similar, problems have arisen with regard to religious persecution and witch-hunting on the most barbarous scale, which survived sixteen centuries of Christianity. They gradually fell out of use, not because of the realisation that they were morally wrong, but because of the spirit of scepticism that was abroad early in the eighteenth century—reflected particularly in the *Treatise* of David Hume (1728–40). The revolting treatment of lunatics continued even longer, throughout most of the polite and sophisticated 1700s, when one of the shows available for the amusement of visitors to London was the antics of the inmates of Bethlehem Hospital, or Bedlam; such scenes were material for *The Rake's Progress* of William Hogarth (himself a socialist reformer) as late as 1735. It was not until the 1790s, when research was devoted to cerebral anatomy and physiology, that insanity was regarded as a matter rather for compassion and treatment than ridicule and contempt. Slavery owed its abolition as much to intellectuals like Steele, Pope, Thomson, Cowper, Sterne, Johnson, and Adam Smith, as to religious reformers like Wesley, Whitefield, and Granville Sharp. It received its death-blow in England (in the early 1700s) from lawyers like Mansfield. In America, as we know, slavery was nominally abolished by political action only in 1865, but racial intolerance still persists in many of the States.

Penal Reform.—Penal reform owed its inception principally to two men—the investigator and research-worker John Howard (the greatest of whose work was done between 1777 and 1784), and the Utilitarian philosopher Jeremy Bentham, whose *Principles of Morals and Legislation* (1789) laid the foundations of our present system. He advocated the prevention of crime by the scientific method of seeking out and removing its cause, and the reform of the convicted criminal by means of his classification, education, and rehabilitation in the community on his discharge. He taught that conduct is morally "good" only when it promotes the greatest happiness of the greatest number; all punishment, being in itself evil, ought to be admitted only so far as it promises to exclude some greater evil.

Until comparatively recent times the only conception of punishment, apart from sporadic experiments by reformers like Pope Clement XI (1700–21), who built a prison for the special treatment of young offenders, was by death or the infliction of physical pain. In France, the worst savageries of the criminal law were swept away by the Revolution in 1789; in our country Sir Samuel Romilly could say, as late as 1817, "the laws of England are written in blood." In his day the death penalty was still exacted for thefts of more than forty shillings in value; transportation remained a common form of punishment until 1852, when it was replaced by penal servitude, and executions might still take place in public until the 1860s. Even in our own times there have been judges who regarded deterrence as the principal function of the criminal law.

Recent Government Recommendations.—Since the 1930s the emphasis has gradually changed. The 1959 White Paper presented to Parliament by the Home Secretary, entitled *Penal Practice in a Changing Society,* contained a number of enlightened ideas for dealing with the new wave of crime which has been evident since the end of the last War, despite increase in prosperity—contrary to the beliefs of reformers like Bentham, who thought that, if poverty and starvation were removed from society, crime would diminish. That document tried to formulate scientific problems in a scientific way; the recent and continuing prevalence of offences involving violence was regarded as an opportunity for the study of symptoms, research into causes, diagnosis and selection of treatment. Panic legislation was rejected in favour of experiment, adjustment, and trial of new techniques.

In April 1964 a White Paper was presented to Parliament by the Home Office, entitled *The War Against Crime in England and Wales—1959 to 1964.* It is written in an equally enlightened manner; it recalls that the 1959 document proposed a "fundamental re-examination of penal methods based on studies of the causes of crime or rather the factors which cause or inhibit crime and supported by a realistic assessment of the results achieved by existing methods." It reminds us that the increase in violent crimes, which had been evident in the years before 1959, has continued from 1959 to 1964, and so has the search for more effective remedies.

Some Statistics.—Between 1964 and 1965 there was an increase of 6·2 per cent in the indictable offences recorded by the police, an increase of 8 per cent in breaking and entering, and an increase of 18·8 per cent in violence against the person. Convictions on these offences rose during the period by 6·4 per cent. One-third of all those convicted each year are under 17 years of age one-half are under 21, as are also two-thirds of those convicted of breaking and entering. Even when account is taken of the strength of the Police Force and better records, and more co-operation

the public, there has still been a substantial
ase in the actual volume of indictable (grave)
es—from 744,000 in 1960 to 1,134,000 in 1965.

**evention and Detection of Crime: Recent
lopments.**—As criminals become better organ-
and use more efficient techniques, it is neces-
for police methods to keep pace with these
ges. Substantial increase in police pay has
o an improvement in recruiting, and between
and 1965 the number of policemen in England
Wales has risen from just under 70,000 to just
83,250. In the provinces the Forces are
tantially up to strength, but in London and
large cities a further 10,000 policemen could,
estimated, help to reduce the wave of crime.

man-power has been strengthened, more
e have been engaged in the work of prevention
detection; the engagement of civilians (such
affic wardens) has been a further aid to effi-
y. New powers are being given to the Home
tary, by Parliament, to this end; in the
e Office itself a Police Research and Planning
ch has been established to concentrate on
s of combating the growing volume of serious
unsolved crime. There have been improve-
s in the prospects of promotion and of train-
t the Police College, and also in the provision
odern housing for policemen and their fami-
the budget for which has risen since 1959
£1,200,000 to over £5,000,000. Discussions
have taken place between the Home Secre-
and persons prominent in voluntary services to
ommunity have resulted in the establishment
presentative committees to study the facts
linquency and the best ways of using local
rces against it.

ntencing Policy in Criminal Cases.—The Home
has been aiming to secure full information
ne courts about the background of offenders
ose best qualified to supply it, full co-ordina-
of this information and its prompt applica-
to ensure that sentence follows immediately
conviction. The Criminal Justice Act, 1962,
des that no one should normally wait more
8 weeks, after committal, for trial; and the
e Office is giving careful guidance to Magis-
s and others as to what is involved in every
of sentence, what it is designed to achieve,
it in fact achieves, and its result. On 30
1964, *The Times* published an important
e by a well-known Criminologist on *Sentenc-
olicy in Criminal Cases*; on the same day the
Chief Justice called for group study to secure
rmity in sentencing policy and a deeper
rstanding of the social factors involved, and
June the Lord Chancellor proposed compul-
courses for J.P.s.

w Reform.—On 15 June 1964 the Criminal
al Act gave power to the Court of Criminal
al (now called the Court of Appeal (Criminal
ion) to order a fresh trial on new evidence,
Committee under Lord Donovan is reviewing
nstitution, powers, and procedure. Other
tion has dealt with suicide, indecent offences
st children, the order of Counsel's addresses
iminal Courts, the alteration of the verdict
uilty but insane" to one of "not guilty
se of insanity," and provision has been
for the continuance of a trial where a jury-
has died or is discharged. The Criminal
e Bill, 1966, provides for verdicts of juries
majority of 10 to 2, instead of unanimity.
tanding Committee on criminal law revision
sidering the law of larceny and perjury, the
lance of witnesses at criminal trials, and the
n of crimes into felonies and misdemeanours.
ee the Criminal Justice Bill, 1966, proposing
written statements at *preliminary proceedings
magistrates*, instead of evidence by word of
unless either prosecution or defence especi-
equests it (D6(2)). The law on betting and
g is to be tightened up.

ventive detention and corrective training
ing abolished; in their place prison sentences
ose over 21 are to be drastically increased, in
f grave offences. The Prison Rules were
led in 1963 to make all prisoners already in
ntive detention eligible for release after serving two-thirds of their sentences. The 1965 White Paper (Cmnd. 2742) proposes further drastic changes (*see* **D36**).

Probation Service.—The Morison Committee reported in 1962 on the Probation Service and made recommendations. Salaries have been raised to new levels; in 1965 there was an increase from 182 to 283 in the number of students in training; and a Probation and Advisory Training Board has been set up. Twenty-eight Probation Inspectors have been appointed; the strength of the service has been increased to 2,417, and it is hoped to bring it up to 2,750 during 1966. Under the Administration of Justice Act, responsibility for the London Probation Service is transferred from the Home Secretary to a Probation Committee composed of representatives of the Courts.

Prisons.—For adult offenders, five remand centres have been opened and a number of prisons for both men and women, of various kinds, have been built or planned. Overcrowding is being reduced; the number of men sleeping three to a cell has fallen from 5,337 in Jan. 1965 to less than 5,000 in Sept. 1965. Further relief will be obtained when the new prisons under construction are completed. The strength of the prison service has risen to more than 7,300 in April 1965 (excluding administrative staff).

Employment of Prisoners.—The Home Secretary's principal objectives are to reduce overcrowding, to improve training facilities for long-term prisoners, and to give them proper employment; to develop the hostels which help their transition from detention to freedom, and to establish a sound after-care system.

After-Care.—Under the Criminal Justice Act, 1961, the assistance of after-care has already been applied to persons released from detention centres, and arrangements are being reviewed for organising statutory and voluntary after-care for those discharged from prisons, borstals, detention centres, and approved schools. The Advisory Council has recommended that full use should be made of the help of voluntary workers, and that those concerned with the welfare of persons in custody, and with the preparations for their release, should become members of the Prison Service. The Government has accepted these proposals, though it will take time to recruit and train the necessary staff. A great importance is attached to voluntary work.

Juvenile Delinquency: Emphasis on Prevention.—A strong Advisory Committee has been appointed to take into account conditions in the home, the family, at school and at work, the housing situation, and the personality of the delinquent. The Committee is concerned rather to find out the reasons why juveniles commit crimes, and what can be done about it, rather than with methods of punishment after the crimes have been committed. The 1959 proposals were very largely concerned with the *treatment* of delinquents; the 1964 White Paper lays the emphasis on *prevention*. Special importance is attached to the powers and duties of every County Council and County Borough Council "to make available such advice, guidance and assistance as may promote the welfare of children by diminishing the need to receive them into or keep them in care . . . or to bring children before a Juvenile Court." These duties are imposed by Section 1 of the Children and Young Persons Act, 1963, which also empowers Local Authorities to arrange for voluntary organisations to provide any of these services. (For the 1965 White Paper, *see* **D36**.)

The Need for More Research.—Further investigation is needed into the social and psychological aspects of delinquency, methods of prevention and the effects of the various kinds of "treatment" (this word is being increasingly used in place of the word "punishment"). In 1963 a Committee was appointed to examine the influence (if any) of television upon juvenile delinquency and this is being financed by the I.T.A. Full details of research are set out in the appendix to the White Paper.

Treatment of Offenders.—The Criminal Justice Act, 1961, increased the maximum fines for *juvenile offenders*, reduced the minimum age for attendance at an attendance centre from 12 to 10; altered the conditions of after-care for children released from approved schools, and permitted the temporary removal of unruly pupils, and the transfer to borstal, of those who cannot benefit from approved school training or interfere with the training of others. Power was given to the Home Secretary to give fresh directions on the management of approved schools and to regulate the constitution of voluntary managing bodies; the minimum age at which a sentence of borstal training can be imposed has been reduced from 16 to 15; imprisonment for offenders under 17 has been abolished, and borstal has become the principal form of institution for training offenders between 17 and 21 (as well as for those between 15 and 16 not suitable for approved schools). Where offenders between 17 and 21 are sentenced to imprisonment, great changes are made in the conditions; sentences must now be either not more than 6 months, or over 3 years. As detention centres will take the place of prisons for all offenders under 21, the Act provides for abolishing these sentences of imprisonment by Order (abolished by Order of 1963).

Home Office Children's Department.—A great building programme for approved schools and their modernisation should provide 2,000 more places than were available in 1961. The Central Council for Child Care is organising the training of staff for approved schools and remand homes; in the latter there has been a 27 per cent increase in places available, and five new homes were completed by 1966.

The Home Secretary has, since 1 April 1963, been responsible for the functions formerly carried out by the Prison Commission; and the work of his Prisons Department is closely integrated with that of other departments dealing with the treatment of delinquency.

Detention Centres.—Offenders in remand homes, detention centres, borstals, and prisons have risen from 29,000 in 1964 to 30,421 in 1965. Expenditure has increased from £822,000 in 1958–9 to £6,935,000 in 1964–5; and 27 new establishments have been opened. Eight further remand homes are under construction. Detention centres have increased since 1959 from 4 to 15, including one for girls; there is room for about 3,800 a year in those for boys of 17 to 21 and about 900 a year for boys from 14 to 17. Five new borstals for boys (accommodating 1,000) have been built since 1959 and one for girls; when the two new ones have been completed, there will be an additional 300 places for boys and 80 for girls. As a result of the recent legislation the number of offenders under 21 sent to borstal has increased and of those sentenced to imprisonment has fallen.

New Royal Commission—a Scientific Approach. The 1964 White Paper expressed doubts whether the existing penal methods produce sufficiently good results; for example, boys leaving approved schools seem less responsive to training than they used to be. It is questioned whether enough is being done to experiment with new methods of treatment, rather than concentrating to much on trying to improve the traditiona methods. Another problem to be considered whether the separate control of different form of treatment is satisfactory; probation is th responsibility of Magistrates; attendance centres detention centres, and borstals of the Government remand homes and approved schools of the loca authorities. A new Royal Commission has bee set up to make a fundamental review of the whol penal system, to re-assess its value and study wha we ought to be seeking to achieve, to examine th deficiencies of the present system and to conside new ideas. All these questions are to be invest gated in the light of modern knowledge of crim and its causes, and of modern penal practice her and abroad; the Royal Commission is also to re examine the concepts and purposes which underli the treatment of offenders in England and Wales to report how far they are realised by the method available to the courts; and whether these, or th arrangements for selecting the sentences of pa ticular offenders, should be changed; and also t review the work of the services themselves Priority is to be given to offenders under 21 (wh form so high a proportion of the total); improve ment in the handling of young offenders would b of value in the war both against juvenile delin quency and against adult criminals.

The 1965 Proposals.—On 24 August 1965, afte much ventilation in Parliament and the press, th Government published a new White Pape (Cmnd. 2742) containing proposals for furthe radical changes in the treatment of youn offenders. They are "*provisional* proposals fo practical reforms *to support* the family, *to foresta and reduce delinquency*, and to *revise the law an practice* relating to *offenders up to 21*. They ar published for the *purpose* of *discussion* befor legislation is prepared." Interested organization will be consulted and the advice sought of thos who will have to operate any new system.

Conclusion.—All these activities represent " formidable armoury" for intensifying the wa against crime. It seems that the mistakes o earlier generations have taught us a good dea about delinquency; the aim is still a study o symptoms, research into causes, diagnosis o causes and selection of remedial treatment rathe than mere attempts at deterrence. Although th application of reformative principles has no succeeded in reducing crime during the past 2 years, and in fact, under the affluent society violent crime has even increased, we must conside the matter dispassionately and realise that it ha not been proved that the abolition of bruta punishments has necessarily been the cause of th increase in delinquency. The authorities hav not reverted to panic legislation for outmode methods of punishment; prevention of crime now the chief Government aim, though reforma tion, retribution and deterrence are not forgotte Among other things the Malicious Damage Ac has given the Magistrates Courts powers to awar a maximum amount of compensation for damag to property to victims of violent crime of £10 plus a maximum fine of £100; and proposals ar being considered for compensating victims o personal violence, and for the criminal to co tribute towards such compensation (and *se* **D6**(1)).

ADOPTION OF CHILDREN

Adoption is the act of a person who takes upon himself the position of parent to a child who is not in law his own legitimate child. It has been for centuries very common in India and most Continental countries, and for over a hundred years in most parts of the United States. It was recognised by the laws of Greece and Rome from early times. Julius Caesar adopted his grand-nephew Octavian (afterwards the Emperor Augustus) in 46 B.C. But there was no provision for adoption under the Common Law of England (**D4**); the transfer of parental rights and duties in respect of a child to another person was unknown to our law until 1926, when the first of a series of Adoption Acts was passed. There have been a numbe of amendments since then. The present law mainly contained in the Adoption Act, 195 "Informal adoption," outside the Act, is invali

The procedure for adoption is as follows:

(1) Approach by would-be adopters to registered Adoption Society or Local Autho ity for help in adopting a child, and explana tions of their qualifications.

(2) Investigations of suitability of perso and home, including medical matters, an notification to parent(s) of eventual need f

ormal consent and effects of Order when nade.

(3) Informal consent of parents or guardian) handing over of child to would-be adopters on trial."

(4) Actual handing over of child to would- e adopters " on trial."

(5) Formal application by would-be adop- ers to a Court.

(6) Formal consent of parents to adoption.

(7) Hearing by the Court. If an Order is efused, and there is no appeal, the child must e returned to its parent(s), or to the Local uthority if the parents are unsuitable. here may be an appeal, while the child is ill in the hands of the Applicants, to the ourt of Appeal and the House of Lords. If ne original application, or appeal, succeeds, n Order is made. *Then, and only then is e child adopted.*

shall now explain the sequence in more

lications for Adoption.—The would-be ers (the " Applicants ") normally approach stered Adoption Society, a County Council nty Borough Council to make and partici- in adoption arrangements, which must ally be confirmed by an Order of the High a County Court, or a Magistrates' Court g juvenile cases. The Adoption Society or Authority carefully investigates the suit- of the Applicants, interviews them and heir home, and ascertains the religion in the parents wish the child to be brought up. pplicants must produce a certificate from a red medical practitioner to the effect that re in good health, as must the parents of the o certify that its health is good. The Society cal Authority must hand the parents a randum, in ordinary language, explaining ects of an Adoption Order if made by the and calling attention to the parents' formal t being eventually required. Such consent e withdrawn at any time before the Order ally made, but may be dispensed with by urt on special grounds (see below, para 3).

l these preliminary matters are satisfactory ciety or Council may hand the child over onally to the Applicants for a " trial " of not less than three consecutive months ng the Order, if made; but no period is l before the child is six weeks old. No um period is laid down by law within which plicants must apply to the Court. This is d by reformers as a serious defect in pro- In a recent case (December 1965) nearly ars had elapsed between the handing over child " on trial " to the would-be adopters r home, and the Court Hearing. The of the child were F, a married man, and stress M, a single woman, both Roman cs. Without the knowledge of F, M d to hand over the child to the would-be rs (X and Y, also Roman Catholics but gers " of good repute), whose home was tly suitable and who would have made t adopters. (A " stranger " is anyone not a " parent " or " relative ".) The emained in their care and possession from of six weeks to two years. Meanwhile eft M and had become reconciled with his He complained, shortly before the Court he case, that his formal consent had not tained, and claimed the right for himself access to and custody of the child under itimacy Act 1959; his wife supported his ion. The result of the delay was that the ourt Judge, having seen and heard all decided reluctantly that there was little se between F and his wife, on the one hand, Applicants X and Y; but felt that the tie " between father and child justified an Order to the " strangers," and ordered l to be handed over to F and his wife (who course applied for an Adoption Order). Y appealed to the Court of Appeal, but t of three Judges upheld the original decision, and a further appeal to the House of Lords failed. Thus the child, two years old, was taken away from the only " parents " it had ever known and handed over to F and his wife whom the child did not know at all. This is an unusual case, but a very sad one, and reformers consider that there should be a maximum period of (say) six months, within which the Applicants must apply to the Court for an Order, and the parents should be compelled to decide within that period whether or not they are prepared to give formal written consent to the proposed adoption.

Such formal consent may be dispensed with by the Court if a parent, or his or her wife or husband, cannot be found, is incapable of consenting, or is living apart in what seems likely to be a permanent separation. A parent's consent may also be dispensed with if he or she has abandoned, neglected, or ill-treated the child, or is " unreasonably " refusing consent. If the parent does not attend the Court hearing, that consent must be given in writing, witnessed by a J.P., County Court officer, or Magistrate's Clerk; or outside England by a British Consul or Vice-Consul or foreign Notary.

As soon as an application to the Court is filed by the Applicants, the Official Solicitor (or, in Magistrates' Court cases, the Clerk to the Local Authority) is appointed the child's guardian *ad litem* (*i.e.*, guardian for the purpose of the proceedings, who looks after the interests of the child without regard to those of anybody else). If no appointment for the Court hearing is made within 15 days from the application to the Court, the guardian *ad litem* must apply for the Court's directions. (This is a new rule, to avoid some such delay as arose in the case described). The Court then hears the case *in camera* (*i.e.*, in private, the public not being admitted) and has a complete discretion either to make or to refuse an Adoption Order. If refused, and there is no appeal, the child must be returned to its parent(s) or, if they are unsuitable, placed in the care of the Local Authority. If an Order is made or the Applicant(s) successfully appeal, the child remains with the Applicant(s): only on the making of an *Adoption Order* by the Court is the child legally adopted.

Adoption Orders.—The High Court, a County Court, or a Magistrates' Juvenile Court may make an Adoption Order authorising an Applicant, in the prescribed manner, to adopt a child. An Order may be made on the application of two spouses jointly, or by one spouse with the consent of the other spouse; but in no other case may an Order be made in favour of more than one person. (Dispensing with consent—*see Applications for Adoption*, para 3). An Order may be made authorising the adoption of an illegitimate or legitimated child, or the re-adoption of an already adopted child (*e.g.*, in case of the death of the Adopter(s)), by his or her mother or natural father, either alone or jointly with his or her spouse: this facilitates the adoption of illegitimate or legitimated children and puts them (for record purposes) on a par with legitimate children who have been adopted. (A legitimated child is one born out of wedlock, but whose parents have subsequently married).

An Adoption Order may not generally be made in England unless the Applicant and the child are living in England. Nor may an Order be made unless the Applicant (or one of two Applicants) is: (*a*) the mother or father of the illegitimate or legitimated child (with the other parent's consent); or (*b*) a " relative," *i.e.*, a grandparent, brother, sister, uncle, or aunt of the child, or a person who would be such relative if the child were the legitimate child of its mother or father, or of former adopters, and such relative is aged 21 or over; or (*c*) in any other case, is 25 years old or more. On the application of a sole male Applicant to adopt a female child, no Order may be made unless the Court is satisfied that there are " special circumstances " justifying an Adoption Order " as an exceptional measure."

No Adoption Order may be made unless the child has been continuously in the care and possession of the Applicant for at least three consecutive months immediately preceding the Order (not counting any time before the infant is six weeks old): this is subject to the safeguards detailed below as to supervision of a "protected child." But in the case of Applicants domiciled (**D7**) outside Great Britain, who desire to adopt an infant under the law of the country of domicil, and to obtain a provisional Adoption Order in England, the child may be taken or sent abroad for the purpose first mentioned and the period of three consecutive months is extended to six). Except where one of the Applicants is a parent of the child, no Order is to be made in respect of that child who, at the hearing, is below the upper limit of the compulsory school age, unless the Applicant has given notice, in writing, to the Local Authority of his intention, at least three months (in cases of provisional adoption, six months) before the Court Hearing.

Formal Consents Required.—No Order may be ordinarily made without the consent of every person who is a parent or guardian of the child (which may be given either unconditionally or subject to conditions as to the religion in which the parent or guardian requires the child to be brought up). Even so, the consent of the parent or guardian may be dispensed with (*see Applications*, para 3). Where a parent or guardian has given informal consent without knowing the identity of the Applicant(s), and subsequently withdraws his or her consent solely on this ground, he or she is deemed to be witholding consent "unreasonably."

Matters on which the Court must be satisfied.—Before making the Order the Court must be satisfied:

(*a*) that every person whose consent is necessary, and has not been dispensed with, has consented to and understands the nature and effect of the proposed Adoption Order; in particular that every parent understands that the effect will be to deprive him or her permanently of his or her parental rights;

(*b*) that the proposed Order will be for the child's welfare;

(*c*) that the Applicant has not received or agreed to receive, and that no person has made or given, or agreed to make or give, any payment or other reward, in consideration of the adoption, except such as the Court may sanction (if any).

As to (*a*), the Court must have regard to the Applicant's health, to be evidenced by the certificate of a fully registered medical practitioner; the Court shall also give due consideration to the wishes of the child, having regard to his or her age and understanding. The Court may impose such terms and conditions as it thinks fit, including a requirement that the adopter shall make such financial provision for the child as is just and expedient. It may postpone a decision on the application and make an interim order giving the Applicant *custody* of the child for a probationary period not exceeding two years, upon such terms as it may think fit, for the maintenance, education, and supervision of the child's welfare. The same rules apply to an interim order for custody, as to consent and dispensing with consent, as for a final Adoption Order; but the Court may not make an interim order without the three months' care and possession and notice to the Local Authority as are provided above. An interim custody order for less than two years may be extended to the full two years, but no longer. An interim order for custody is not an Adoption Order.

Procedure and Appeals.—To safeguard the child's interests during the hearing the Court has to appoint a guardian *ad litem* (*see Applications for Adoption*, para 3).

Effects of Adoption Orders.—Upon an Order being made, all rights, duties, obligations, and liabilities of the parents or guardians in relation to custody, maintenance, and education of the child, including rights to appoint a guardian by will, to consent or refuse consent to its marriage, shall
extinguished; and all such rights, etc., shall
exercisable by, and enforceable against, t
Adopter(s) as if the child were his, her, or th
legitimate child, and the child shall stand to t
Adopter(s) in the same position. If two spous
are the Adopters, they shall stand to each oth
and to the child (for the purpose of court ord
for custody, maintenance of and right of acc
(**D20**)) as if they were the lawful father and moth
and the child shall stand to them in the sa
relation.

For the purpose of the marriage laws, an Ado
ter and Adoptee shall be regarded as if they we
within the prohibited degrees of blood relatio
ship—even if a later Adoption Order is made
favour of another person (*i.e.*, an Adopter may n
in any circumstances marry the Adoptee).

Succession to Property.—If, after an Adopti
Order, the Adopter or Adoptee dies without a w
in respect of any property, the property sh
devolve as if the Adoptee were the lawful child
the Adopter (**D18–20**) and not the child of a
other person. In any disposition of proper
made by will, codicil or settlement (**D16**, 20) aft
an Adoption Order, a reference to the "child
children" of the Adopter shall include a referen
to the Adoptee (unless the contrary intenti
appears). The will or codicil is treated as havi
been made at the Adopter's death. But any refe
ence to the "child or children" of the natu
parents (or either of them) shall not include
reference to the Adoptee. And any reference
a "relative" of the Adoptee shall (unless t
contrary intention appears) be regarded as a refe
ence to the person who would be such a relati
if the Adopter were his lawful parent. (But the
provisions do not apply to any dignity or title
honour—*e.g.*, a hereditary peerage).

For the purposes of the Administration
Estates Act, 1925 (**D18–19**), an Adoptee shall
regarded as a brother or sister of any child
adopted child of the Adopter. Executors a
administrators (**D18–19**) are not liable if they d
tribute the estate of the Adopter without asc
taining that no Adoption Order has been mad
but the Adoptee may sue the beneficiary for t
Adoptee's share of the property; but if there h
been more than one Adoption Order, the earli
adoption shall be disregarded.

Citizenship.—If the Adoptee was not a citizen
the United Kingdom and Colonies (**D7**) but t
Adopter or male Adopter is, the Adoptee shall
such a citizen as from the date of the Adopti
Order.

Registration.—The Registrar-General is to ke
an Adopted Children's Register, to contain auth
ised entries but no others. A certified copy of t
entries counts as evidence; the index may
searched by anybody, who may obtain a certifi
copy of any entry. No other record may be se
by the public without a Court Order. Eve
entry shows only its number, date, and count
of birth of the child, the name and adopted su
name of the child and of the Adopters, the date
the Adoption Order and of the Court, the date
entry, and signature of the Registrar. The wo
"adopted" or "re-adopted" is written agai
the name of the child in the Register of Birth
but this shall be cancelled if an Adoption Order
refused or an appeal against adoption succeeds.

If a child adopted by its mother or natu
father is subsequently legitimated by their ma
riage, the Court of Adoption may, on their app
cation, revoke the Adoption Order and the entr
in the register and any certificate shall be ca
celled.

Local Authorities and Adoption Societies.
Except for the Local Authorities or register
Adoption Societies mentioned at the commen
ment of Applications for Adoption, para 1,
other body may make adoption arrangemen
and even the authorised bodies may not place t
child in the care and possession of a would-
adopter if the last-named person could not la

dopt him, under the penalty of a fine of r six months' imprisonment; and the nay order the child to be returned to his s) or guardian(s) or to the Local Authority stered Adoption Society. There are strict ons as to which Adoption Societies may be ed or struck off the register, and as to .

and Possession of Infants awaiting Adop- While an application is pending, a parent rdian who has assented may not, without rt's leave, remove the infant from the care ssession of the Applicant; the Court will e leave without considering the infant's . The parent(s) or guardian(s) may not ck an infant, in the care and possession of plicant, before the actual Adoption Order, st give written notice to the Authority or (before an Adoption Order is made) of the s or guardian's intention to part with the n which case the child must be handed to plicant(s) through the Authority or the . Only in cases where the adoption tion is refused by the Court or on appeal, e child be returned to or retained by the or guardian.

rvision.—Where arrangements have been or placing a child, below the upper limit pulsory school age, in the care and posses- a "stranger," or where notice of intention y for an Adoption Order is given, then the known as a "protected child" while it is care and possession of a "stranger"; but t is in an Approved School or some other nder the Children's Acts. The child ceases "protected child" at the age of 18, or on king of an Adoption Order. It is the duty y Local Authority to see that every "pro- hild" is periodically visited by its officers, all satisfy themselves of the child's well- nd give such advice as may be needed. cers must produce a document of authority, y then inspect any premises where the kept or to be kept. It is the duty of any ger" to give notice of all arrangements gard to "protected children," including ange of address, and particulars of the ex, date and place of birth, and name and of the parent(s) or guardian(s) or person(s) om the child is received. In the event of ected child's" death, the person(s) having d possession must give written notice to thority. If neither the Local Authority egistered Adoption Society took part in ngements, and it appears to the Authority ch arrangements would be detrimental to d, the Authority may in writing prohibit posed Adopters from keeping the child in emises, subject to appeal to a Juvenile If the Court is satisfied that a "protected is received or about to be received by an rson, or in non-approved premises, the Court may order his removal to a place of safety until he can be restored to his parent(s) or guardian(s) or relative(s). On proof that there is imminent danger to the child's health or well-being, this power may be exercised by a J.P. A Local Authority may receive any child so removed (even if not a "protected child" and even if he is over 17) informing the parent(s) or guardian(s) of what has been done. There are heavy penalties for any contravention by a "stranger" of these provisions.

A warrant may be issued, in the event of refusal to allow a visit, or the inspection of premises by an authorised person.

General.—It is generally unlawful to give any payment in consideration of the adoption of a child, any grant of consent (*i.e.*, formal or informal) in connection therewith, the transfer of care and possession, the making of arrangements for adoption—penalty, fine £100 and/or six months' imprisonment; but this does not apply to payment of a registered Adoption Society's expenses, or any payment authorised by a Court. No advertisement may be published indicating the desire of the parent(s) or guardian(s) to have his, her, or their child adopted, that a person desires to adopt a child, or that any person (except a Local Authority or registered Adoption Society) can make such arrangements—penalty, fine £50.

Detailed Court Rules have been made for the carrying out of these arrangements.

There are five Schedules to the 1958 Act. Schedule III, the most important, sets out the nature and purposes of the Regulations which every Adoption Society must have.

> Every Adoption Society must set up a "case committee" of not less than three, to consider each individual case.
>
> No child shall be delivered to the proposed Adopter until the latter has been interviewed by the case committee, who must inspect the premises where the child is to live permanently after all the reports have been considered.
>
> Every Society must furnish a report on its activities and the prescribed accounts.
>
> Provision must be made for the care and supervision of any child placed with a Society with a view to adoption.
>
> There is a prohibition of or restriction upon disclosure of records kept by the Society, and provision for their safe keeping.

Note: The Law Commission has recommended a new branch of law called "Family Law" to include *all* matters relating to infants (including adoption, legitimation, care, custody, and control, as well as matters of marriage, divorce, and separation), to be supervised by one Division of the High Court, instead of sharing them (as at present) between the Chancery and Divorce Divisions.

JUSTICES OF THE PEACE

ncing Policy.—The arrangements, an- l at the end of May 1964, by the Lord Chief "for the purpose of achieving greater ity of sentencing policy and a deeper anding of the many social factors in- ' comprise the organisation of more and onferences of all holders of judicial office, g justices of the peace, chairmen of quarter , recorders and High Court judges. Work- ties, in groups, are to consider case his- f "offenders," and later meet to discuss ences which each group would have passed cases had come before them in court. On e day it was announced from Downing that a Royal Commission was being ed (under the chairmanship of Lord Amory Chancellor of the Exchequer)).

> conduct a fundamental review of penal hods, the concepts and purposes which uld underlie the punishment and treat- t of offenders in England and Wales; to rt how far they are realized by the alties and methods of treatment available, whether any changes are desirable in these, or in the arrangements and responsibility for selecting the sentences to be imposed on particular offenders; and to review the work of the services and institutions dealing with offenders and the responsibility for their administration, and to make recommendations."

Compulsory Training of New J.P.s.—Early in June 1964 the Lord Chancellor announced new arrangements for the *compulsory* training and instruction of newly-appointed justices of the peace, and fresh attempts to stop "glaring instances of inadequate, excessive or inconsistent sentences." An advisory council is to re-organise the present scheme for *voluntary* training (which started in 1950), and every newly-appointed justice is to give an undertaking not to try cases, without the Lord Chancellor's authority, until he or she has been through a *compulsory* course. The course will include attending as observers in their own and other courts and at quarter sessions, and visits to prisons, borstals, and similar institutions.

General Duties of J.P.s—All these announcements have focused attention upon the work of justices of the peace—the unpaid, lay magistrates throughout the country who deal with the largest proportion of criminal offences, in various courts. Other manifold duties fall upon them—the appointment of special constables, certain matters relating to highways, the grant and renewal of licences for the sale of intoxicating liquors, "domestic proceedings" (matrimonial orders between husband and wife), custody of children and affiliation and adoption orders. Certain magistrates—both laymen and lawyers—with special qualifications sit in juvenile courts to deal with offences by and against young people, and with the committing of young people to the care of approved persons or authorities, whenever the young people are in need of care and protection.

Although, therefore, the criminal jurisdiction of J.P.s (as they are generally known) is by no means the full extent of their duties, it is this criminal jurisdiction which has been most frequently in the public eye; and the three announcements mentioned above relate only to that aspect of the J.P.s' duties. Neither historically nor currently are J.P.s expected to be lawyers; the clerk of the court, who advises them on points of law, is always a solicitor; and at quarter sessions the chairman and deputy chairman are usually barristers or solicitors of not less than ten years' standing, with special qualifications for the task.

Procedure and Powers.—For "domestic proceedings" and in juvenile courts (outside the City of London and the metropolitan stipendiary court area, where full-time, legally-qualified, paid magistrates preside), not more than three J.P.s should sit, including both a man and a woman, whenever practicable. For other duties not more than seven J.P.s (and, preferably, not more than five, and an odd, not even, number) should sit. The election of a chairman and a number of deputy-chairmen is held by the J.P.s in October; those elected hold office for one year from January 1, and are eligible for re-election. All sittings are held in public, except in "domestic proceedings," custody and adoption cases; and in these and in juvenile courts the press, though not usually excluded, are not permitted to identify the parties by name or address, or to publish evidence of an indecent character.

The powers of one single J.P., sitting alone, are restricted to adjourning a trial, remanding a prisoner in custody or on bail, and taking recognisances. An information charging an offence may be laid before him; if it is in writing, and substantiated on oath, he may issue a warrant; in a civil matter, in similar circumstances, he may issue a summons. Search warrants may, in most cases, be issued by a single J.P., and so may a summons or warrant requiring the attendance of a witness. A stipendiary (legally-qualified, paid, full-time magistrate) is not so limited; he has all the powers of a court of summary jurisdiction (*i.e.* two or more J.P.s sitting together).

Criminal Jurisdiction.—Except in those instances in which a special limit of time is prescribed by a particular Act of Parliament, no information may be laid (in regard to a criminal offence), nor complaint (in a civil case) after the lapse of six months from the date when the offence was committed or the matter of complaint arose. The J.P.s' criminal jurisdiction covers (1) the trial of "summary offences" (minor offences triable by a magistrates' court other than under (2) below) punishable by a maximum of six months imprisonment for one offence, or a fine (in general) not exceeding £25. The jurisdiction also extends to (2) certain "indictable" (more grave) offence which may be tried summarily if the accuse consents; in such cases the maximum punishments are 6 months imprisonment or a fine no exceeding £100, or both, for one such offence, o 12 months imprisonment for two or more suc offences. There are also (3) certain petty offence which the accused or the prosecution may elec to be tried on indictment, before a jury at quarte sessions. No offender under the age of 17 may b sentenced to imprisonment by a court of summar jurisdiction; but such young offender may b sent to a detention centre. Alternatively, he ma be committed, in custody, to quarter sessions fo sentence to a period of borstal training. Firs offenders should not be sent to prison; they ar frequently placed on probation.

One J.P. or more may sit as a court of preliminary enquiry to determine whether there is *prima facie* case (*i.e.* one that calls for a defence against an accused which will require his bein indicted before a jury. For this purpose the J.P. take depositions (that is, evidence given by wor of mouth, under oath, by prosecution witnesses and reduced to writing and signed by each witnes who has given it). If the J.P.s decide, at the en of the hearing, that the prosecution has disclose no *prima facie* case, the accused is discharged; there is such a case, then after due warning to th accused that he is not obliged to say anything bu that, if he does answer the charge, anything h says will be written down and may be used i evidence at his trial, he is committed for trial, o bail or in custody (according to the gravity of th charge), at quarter sessions or assizes.

History of the Office of J.P.—The above is b no means an exhaustive account of the duties o J.P.s and of the procedure before them; bu sufficient has been said to indicate the vital importance of their work. The office is bot honorary and honourable; as early as 1327, i the reign of Edward III, the King appointe "conservators" of the peace within his Kingdom and the Justices of the Peace Act, 1361, in th same reign, determined "what sort of person should be Justices of the Peace and what authorit they should have." From that day to this the duties have gradually become more difficult an extensive, as society has grown more complex It would seem that, while there are many advantages in leaving the trial of the less grave offence to lay magistrates (as J.P.s are), the system, whic for over six centuries has prominently figured i our penal practice, will be brought up to date an made more efficient by the proposed compulsor training. The only doubts have arisen on th ground that persons "of the best of reputatio in the counties" (Act of 1344), who are prepare to give their time, without remuneration, to thes public-spirited duties, may find it difficult, or i some cases impossible, to attend courses of trai ing, in their spare time, in addition.

Recruitment of J.P.s.—The Lord Chancellor i his 1965 presidential address to the Magistrate Association at Guildhall, London, said he wou like to see the J.P.s recruited from more varie walks of life, a new system of training for th Bench and the abolition of the *ex officio* justic (*e.g.*, Mayors during their term of office). "T strength of the lay magistracy," he said, "is dependent on the ordinary man and woman realisin that the Benches reflect all shades of opinion an are not representative of one section only." H said he would also like to see more colour magistrates appointed. "There are now tw coloured justices serving on the Bench and thes appointments have both been tremendous successful."

FREE SPEECH AND PUBLIC ORDER

In the constitution of our parliamentary democracy (*see* D5) certain unwritten rules have been recognised for about three centuries past. These rules, which are not always easy to reconcile, may be summarised as follows:

(1) **Free Speech.**—Free and open discussion, *within the law*, ought to be permitted, both in private and in public, of all political, social, mor and religious questions.

(2) **Unpopular Opinions.**—Unpopular or min rity opinions, *lawfully expressed*, privately publicly, by act or word, *do not become unlawf* merely because their expression may induce *oth* *people* to commit *unlawful* acts.

(3) **Provocation.**—Every man is presumed to *intend* the *natural consequences* of his acts; hence, the use of *threatening, abusive or insulting* language or behaviour, if it is *naturally* provocative of disorder, is *unlawful.*

(4) **Public Order.**—The *preservation of public order* is of paramount importance; a magistrate or police officer has a *right and duty* to take *any steps* necessary to *stop a breach of the peace* taking place, or to prevent a breach which he reasonably apprehends.

These rules have recently been widely discussed, as a result of the activities of political extremists who make a special feature of propaganda against racial or religious minorities. Some of their meetings and marches have been accompanied by grave public disorder.

Until comparatively recent times the whole subject depended upon common law decisions (**D4**), not statute law (**D5**). For example:

Unlawful Assembly is a common law offence, constituted by an assembly of three or more persons, intending either *to commit a crime* by open force, or to carry out any *common purpose, whether lawful or unlawful*, in such manner as to give *firm and courageous persons* in the neighbourhood *reasonable grounds* to apprehend a *breach of the peace* in consequence of the assembly. (The words "any *common* purpose, *whether lawful or unlawful*," should be noted.)

Sedition is a common law crime, which includes the doing of *acts* or the speaking of *words* with the *intention* of promoting feelings of *ill-will or hostility* between different classes of the Queen's subjects. If the words or acts (whatever the ntention) have a *direct tendency* to cause *unlawful meetings or disturbances*, they are seditious, since "a man is *presumed to intend* the *natural* consequences of his acts" (see (3), above). This does not mean that there must be no full and free discussion, nor that there is any prohibition upon criticism, or even censure; but there must be *no malignity*, nor any imputation of *corrupt or malicious motives*, such as to incite people *to take he law into their own hands* and to provoke them o *tumult and disorder*

With these principles in mind, let us consider ome actual cases (decided during the past eighty years) in which these rules have been applied.

Beatty v. Gillbanks (1882) arose from the ctivities of the newly-founded Salvation Army, which was "an association for carrying out eligious exercises among themselves, and for a eligious revival among certain classes of the community." Its leaders formed their followers into *processions* which marched through the streets of Weston-super-Mare, with *bands and banners*, colecting people as they marched back to their hall, where *prayer-meetings* were held. They were opposed on several occasions by an organisation alling itself the "Skeleton Army," which obected to these religious exercises. In consequence, isorders frequently arose, and the Salvation Army eaders were charged with "unlawfully and umultuously assembling to the disturbance of he peace." The Magistrates bound them over o be of good behaviour; the Salvation Army ppealed to the High Court.

The Judges decided that *the Magistrates were wrong.* "Everyone must be taken to intend the *atural* consequences of his acts" ((3), above) and *if* this disturbance of the peace was the *atural consequence* of the Salvation Army's ctivities, they would have been liable, and the Magistrates would have been right to bind them ver. But the evidence does not support this ontention. . . . There was nothing in their conuct which was either tumultuous or against the eace; on the contrary, the evidence shows the isturbances were caused by other people, antagoistic to them. What has happened here is that n *unlawful organisation* has assumed to itself he right *to prevent* the Salvation Army from *wfully assembling*, and the *decision of the Magisates* amounts to this—that a man may be *convicted for doing a lawful act if he knows that his doing it may cause another to do an unlawful act.* There is *no authority* for such a proposition."

Wise v. Dunning (1902) is a contrasting case. A fanatical *Protestant clergyman* had, on several occasions, held meetings in parts of Liverpool containing a *strong Roman Catholic population.* At these meetings he had used *offensive, violent, and provocative language*, attacking the Pope and the Roman Catholic Church. In consequence, breaches of the peace had occurred, and the Liverpool Magistrate had bound him over to be of good behaviour. The Protestant clergyman appealed to the High Court, protesting that there was no evidence that he had committed or intended to commit a breach of the peace, and that the Magistrate's decision (as in the earlier case) was wrong. But the Judges *upheld the Magistrate's decision and dismissed the appeal.* The Lord Chief Justice said "there was abundant evidence that, in the public streets, he had used *language which was abusive*, which had *caused an obstruction*, and that he intended to do *similar acts* in another place." The two other Judges said that every case depends upon its own *facts* and *evidence*:

> "The law does not as a rule regard an illegal act as being the natural consequence of a temptation held out to commit it; but . . . the cases show that *the law regards the infirmity of human temper* to the extent of considering that a breach of the peace, although an illegal act, may be the *natural consequence* of *insulting or abusive* language or conduct".

The clergyman's behaviour (unlike that of the Salavation Army leaders in the earlier case) was *in itself violently provocative;* therefore the Magistrate was justified in binding him over, "under preventive power" to stop breaches of the peace, which were the "natural result" of his behaviour.

Both the above cases, as it happened, dealt with religious controversies. But the same rules apply in controversies of other kinds.

Duncan v. Jones (1936) was concerned with provocation on a *political and social* question. There was grave unemployment at the time, and feelings between the unemployed, and their supporters, against the Government, and its policies, ran high. Mrs. Jones had held a *meeting of unemployed* men right *opposite an unemployed training-centre*; she had made a speech strongly attacking the Government's policy, and a *disturbance had followed.* Fourteen months later, when she appeared at the *same place* for the *same purpose*, the Police Superintendent forbade her to hold the meeting there. She insisted on doing so, stepped on her box, and began to address the bystanders. It was not, at that stage, suggested that she was obstructing the highway, or inciting anybody to commit a breach of the peace. Nevertheless she was *convicted of obstructing* the Superintendent *in the execution of his duty*, and her conviction was upheld by the High Court. "She must have known (from earlier experience) the *natural consequence* of holding such a meeting at that place; the Superintendent *reasonably apprehended a breach of the peace;* it therefore became *his duty to prevent it*, and she was guilty of *obstructing him in carrying out that duty.*"

The Public Order Act, 1936.—In the period preceding the Second World War, extremist political organisations held meetings at which they wore political uniforms and used "strong-arm" tactics similar to those in vogue among the Italian Fascists and German Nazis. They also indulged, like the Nazis, in virulent propaganda calculated to stir up racial hatred. As a result of the exasperation of public feelings, in the existing state of international tension, grave disorders took place in London and other cities. The situation was discussed in both Houses of Parliament and it was generally agreed that the law required to be *clarified and strengthened.* On December 18, 1936, the *Public Order Act* received the Royal Assent, and came into force on January 1, 1937.

Prohibition of Political Uniforms.—Section 1 of the Act (subject to certain exceptions) *forbids the wearing*, in a *public place* or at a *public meeting*, of *uniform* signifying the wearer's association with a *political organisation*, or with the promotion of a *political object*. (The exceptions are "ceremonial, anniversary or other special occasions" on which the Chief Officer of Police may permit a relaxation of the prohibition (with the Home Secretary's consent) only if he is satisfied that no risk of public disorder is likely to be involved.)

Prohibition of Quasi-Military Organisations.—Section 2 makes it an *offence* to participate in the *control or management* of an *association* whose members are (*a*) *organised* or *trained* or *equipped* to enable them to be employed "in usurping the functions of the police or of the armed forces of the Crown," or (*b*) *organised and trained*, or *organised and equipped* as follows: either (i) for the purpose of the use or display of *physical force* in promoting a *political object*, or (ii) in such manner as to arouse *reasonable apprehension* that they are *organised*, and either *trained or equipped*, for the purpose described in (i). (It was under (*b*) (ii) that two of the leaders of a present-day extremist political organisation were convicted and sentenced to imprisonment in October, 1962, at the Central Criminal Court; their appeals, in November, were dismissed.) The consent of the Attorney-General (the Senior Law Officer of the Crown) is required before a prosecution under Section 2 can be instituted. In certain circumstances a High Court Order may be made to search the premises of the organisation and to impound its property.

Preservation of Public Order on the Occasion of Processions.—Section 3 confers powers for this purpose, as follows:

(1) On a *Chief Officer of Police*, if he has *reasonable grounds* for *apprehending* that a *procession* may occasion *serious public disorder* (having regard to time, place and circumstances), power *to impose* on the organisers or participants in the procession such *conditions* as appear *necessary for preserving public order* (including the route of the procession and power to prohibit it from entering any "public place"); but no conditions restricting the display of *flags, banners or emblems* are to be imposed unless they are *reasonably necessary to prevent risk of a breach of the peace.*

(2) On a *Borough or Urban District Council* (if the Chief Officer of Police believes that his powers under (1) (above) will not suffice to prevent serious public disorder, and on application by him) power to *make an Order* (with the consent of the Home Secretary) *prohibiting* all *public processions*, or certain classes of public processions in the area for a period *not exceeding three months.* (This power does not apply within the City of London or the Metropolitan Police Area, as to which see (3) (below).)

(3) On the *Commissioner of the City of London Police*, and the *Commissioner of Metropolitan Police*, a power similar to that described in (2) (above), and on similar conditions. Thus, within the *London Area* the *Police Authorities*, and in *urban areas outside London* the *Local Authorities*, are given *power to prohibit processions* (or "marches") on the conditions described in (2) above.

It is an *offence* for anybody *knowingly to fail to comply* with any *Order* or *condition* imposed, *or to organise* or *assist in organising* a public procession *in contravention* of the Section.

Prohibition of Offensive Weapons.—By Section 4, anybody is guilty of an *offence* if he has with him any *offensive weapon* at a *public meeting* or *on the occasion of* a *public procession*, without lawful authority. (Note the words "*on the occasion of* a public procession"; it is *not only those taking part* in the procession, *but also bystanders*, who may commit this offence.) "Lawful authority" extends to servants of the Crown, Members of Parliament or of a Local Authority (acting as such), police officers, members of Fire Brigades or Cadet Corps, and so forth.

Prohibition of Offensive Conduct Conducive to Breaches of the Peace.—Section 5 (as now amended by the Race Relations Act, 1965) reads—"Any person who in any public place or at any public meeting (a) uses threatening, abusive or insulting words or behaviour, or (b) distributes or displays any writing, sign or visible representation which is threatening, abusive or insulting with intent to provoke a breach of the peace, or whereby a breach of the peace is likely to be occasioned, shall be guilty of an offence."

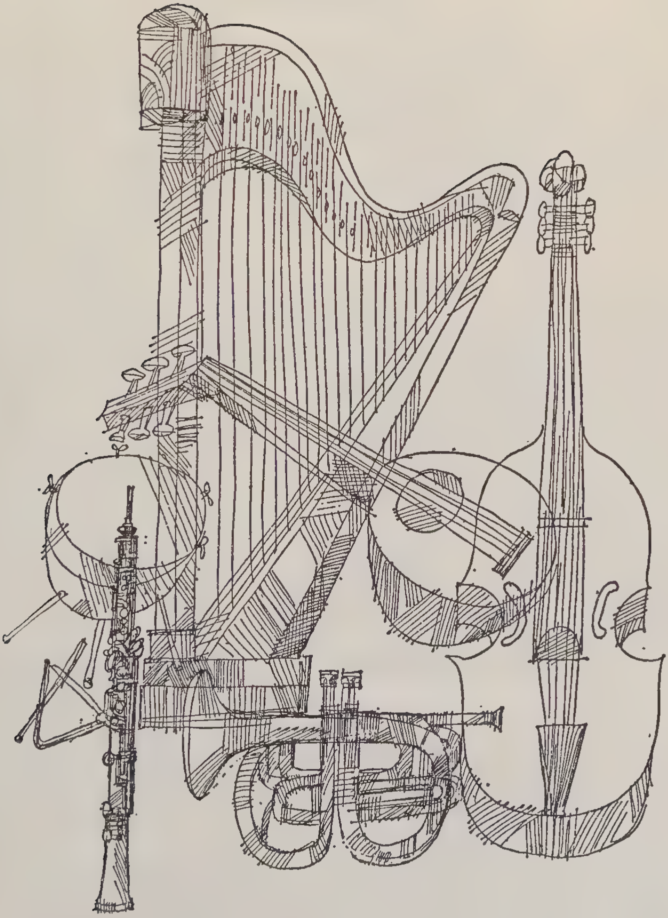
Disorderly Conduct at a Public Meeting.—Section 6 refers to the Public Meeting Act, 1908. Section 1 of the 1908 Act makes it an offence for a person to *act in a disorderly manner* at a *lawful* public meeting for the purpose of *preventing the transaction of the meeting's business.* Section 6 of the 1936 Act gives power to a constable, if he *reasonably suspects* an offence under the 1908 Act, *to demand* of the suspected offender his *name and address* (provided that the chairman of the meeting requests him to do so). If the suspected offender *refuses* or fails to give his name and address, or gives a *false name and address*, he *commits an offence*, and the constable may arrest him without warrant. (Note that, to qualify for protection, the public meeting must in the first place, be *lawful.*) Section 6 of the 1936 Act has been considerably extended and strengthened by Section 6 of the Race Relations Act, 1965, for stirring up hatred on grounds of race or colour. The Public Order Act, 1963, has greatly increased the penalties under Section 5 of the Act of 1936 and Section 1 of the Act of 1908; but an undertaking has been given by the Home Office that the new Act will not be used to suppress mere "heckling" at a public meeting.

Jordan v. Burgoyne (1963) was similar to *Wise v. Dunning* (1902), except that the 1963 case was concerned with section 5 of the Public Order Act. 1936. At a *public meeting* in Trafalgar Square, to an audience of 5,000, *which included many Jews* Colin Jordan used the words—"Hitler was right Our real enemies—the people we should have fought—were not the National Socialists of Germany, but World Jewry and its associates.' There was *complete disorder* and a general surge towards the speaker by the crowd, but they were restrained by the police, under Superintendent Burgoyne; and 20 arrests were made while the crowd was being dispersed.

Before the Bow Street Magistrate Jordan was convicted and sentenced to imprisonment, for "*using at a public meeting insulting words whereby a breach of the peace was likely to be occasioned.*" He appealed to Quarter Sessions, who found as a fact that, though *the words were highly insulting* they were *not likely to lead ordinary responsible persons to commit breaches of the peace*; they therefore allowed Jordan's appeal against conviction. The prosecution then asked for "a case to be stated" for the High Court on the question whether the words in section 5 could properly be interpreted to mean "likely to lead to a breach of the peace by ordinary citizens."

The Lord Chief Justice, with two other Judges decided that *Quarter Sessions were wrong. The test was not* whether the insulting words were likely to cause a breach of the peace by a *hypothetical audience*, whatever their creed, faith, race or political views; in any case the Judges imagined that any *reasonable citizen would be provoked* beyond endurance. But this was an *Act to keep order in public places*, and "a speaker must *take his audience as he finds it.* If those words to that audience are likely to provoke a breach of the peace, the *speaker is guilty of an offence.* The right of *free speech is not in question*; he *may express his views* as *strongly* as he likes, *but he must not threaten, abuse or insult that audience.*" The case was sent back to Quarter Sessions with a direction to find the offence proved, and to dismiss Jordan's appeal from the Magistrate's conviction.

THE WORLD OF MUSIC



Ars Nova.

The term *ars nova* derives partly from writings of Philippe de Vitry (1291–1361) who codified the rules of the old and the new music in a valuable treatise. This *new art* represented a freeing of music from organum and rhythmic modes, and an increase in the shape and form of melodic line. France was the centre of music during the 14th cent. and apart from Philippe de Vitry the leading composer was Guillaume de Machaut (1300–77), who wrote many secular works as well as a polyphonic setting of the Mass. His music is notable for its vigour and tenderness as well as for its technical expertise. Meanwhile in 14th-cent. Italy a quite separate branch of *ars nova* was developing. Imitation and canon were to be noted in the music of Italian composers, and choral forms such as the Ballata, Madrigal (which often included instrumental accompaniment) and Caccia (a two-voice hunting song in canon) were common. The greatest Italian composer of this period was the blind organist and lutenist Francesco di Landini (*c.* 1325–97).

England was less affected by *ars nova* and tended to remain loyal to older forms. Not until the 15th cent. did she begin to make a significant contribution to the history of music. Both John Dunstable (*c.* 1380–1453), who was no less eminent as a mathematician and an astronomer than as a musician, and his contemporary Lionel Power advanced the technique of music by their method of composition (use of the triad, for instance) and mellifluous style. Their musicianship was much appreciated on the Continent. Dunstable did away with the use of *cantus firmus*—a fixed melody—and increased the use of free composition.

After Dunstable the next great figure in European music was Guillaume Dufay (*c.* 1400–74), the most celebrated composer of the Burgundian school. His music is distinguished for its blend of flowing melody, cleverly wrought counterpoint and tender expressiveness. Much travelled, Dufay was a man of catholic outlook. Together with Dunstable and the Burgundian Gilles Binchois he bridged the gap between 14th cent. *ars nova* and the fully developed polyphony of the 15th cent.

Ars nova composers also showed an interest in secular music and many of their *rondeaux* and *chansons* (those of Binchois particularly) have been preserved. Personality began to play a distinguishing part in composition.

The results of Dufay's good work can be heard in the flowering of the Franco-Netherland school later in the 15th cent. Its two most notable representatives are Ockeghem (*c.* 1420–95) and his pupil Josquin des Prés (*c.* 1450–1521), who carried musical expressiveness even further than Dufay; their work can also be grand and majestic. Indeed Josquin's wide range, from the humorous to the dignified, partially accounts for his justly deserved high reputation. He was a master of counterpoint but tempered his mechanical ingenuity with imaginative insight.

Throughout the Renaissance choral music was breaking away, as we have seen, from its earlier bonds. The mediaeval tradition of having the *cantus firmus* in the tenor went by the board; the use of dissonance, when only two voices were used in mediaeval times, was abandoned in favour of euphony; and all the voices, democratically, came to share the musical lines. Composers also began to respect their texts; where words were previously fitted to the music, the reverse was now the case. In Josquin's music, indeed, we have the first attempts at symbolism: matching verbal ideas with musical ones. The importance of this musical renaissance has been realised only over the past twenty years. At last the Renaissance composers are coming to be seen not merely as historical figures relevant only in so far as their work culminated in the great classical composers, but as masters in their own right, whose music should be nearly as familiar to us as is that of a Mozart or a Beethoven.

With the exception of Dufay, little is known of the lives of the musicians so far mentioned. Most of them were in the service of royal or ducal households where they were in charge of the chapel choir, or else they worked in or around the great cathedrals, teaching at choir-schools. They were well rewarded for their services and their social position was probably high.

The Sixteenth Century.

By the 16th cent. music in England was a steadily expanding art and much encouraged. Music-making in the home was becoming quite the fashion in social circles. The Chapels Royal remained the chief musical centres but the music was changing with the development of new secular forms so that it was not so much religious as a part of life. Composers began their lives as choirboys and received a thoroughgoing education, both theoretical and practical.

Carrying on from where Josquin and his contemporaries left off, Palestrina in Italy, Victoria in Spain, Lassus in the Netherlands, and Byrd in England brought the polyphonic style to its zenith. At the same time came the rise of the madrigalists, first in Italy, then in the Netherlands; and then the beginnings of instrumental music as it came to be known in the succeeding centuries.

The vocal composers began to use chorda (homophonic) as well as contrapuntal (polyphonic) methods of writing—examples are Victoria's *Ave Verum Corpus* and Palestrina's *Stabat Mater*—but polyphony was still the fullest most magnificent instrument of composition, as for instance in Byrd's *O Quam Gloriosum* which shows an eager response to the mood and to the inflection of the words in a kind of vocal orchestration. A feature of all these composers' music, but more especially that of Victoria (*c.* 1535–1611) and Palestrina (1525–94), is its serene simplicity and fervour of utterance. Palestrina was perhaps more spacious in his effects, Victoria the more passionate. How well we can imagine—and sometimes hear—their music resounding down the naves of the great cathedrals of Europe.

The music of Lassus (*c.* 1530–94) is distinguished both in sheer amount and in vitality. His mastery in the field of motets was unrivalled, encompassing a wide range of subject and mood. He and his fellow Flemish composers, Willaert, de Monte and Arcadelt, were also expert in the Madrigal, a form popular in Italy and England as well. The Madrigal was a contrapuntal setting of a poem, usually not longer than twelve lines, in five or six parts. The subject (of the poetry) was usually amorous or pastoral. It was a short-lived, but highly prolific vogue. Orlando Gibbons (1583–1625), Thomas Weelkes (*c.* 1575–1623), and John Wilbye (1574–1638) were the most prominent English exponents.

Instrumental Music.

By the end of the 14th cent. instrumental music began to become something more than mere anonymous dance tunes or primitive organ music. Instruments often accompanied voices, or even replaced them, so that the recorder, lute, viol and spinet indoors, and sackbuts and shawms outdoors, had already been developed by the time instrumental music came to be written down. Gradually a distinction grew up between what was appropriate to the voice and what was suitable for instruments. Byrd, Gibbons, and Giles Farnaby in England, the great blind keyboard player, Cabezón (1510–66) in Spain, and Frescobaldi (1583–1643) in Italy produced valuable instrumental works. Perhaps the *Parthenia* and the *Fitzwilliam Virginal Book*, collections of Early English Keyboard music, give as fair a representative idea as any of the development of instrumental form at this time.

In chamber music musicians often played collections of dance tunes strung together to make a whole; or they chose fantasies (or " fancies ") where a composer altered a tune as he wished Then there were sets of variations on a ground

at is a simple tune played over and over again
n a bass viol.

As far as brass instruments are concerned, they
ere often used on festive occasions in spacious
alls or in cathedrals. The Venetian composer
ndrea Gabrieli (*c.* 1510–86) was the first to com-
ine voice and instruments and his son Giovanni
abrieli (1557–1612) carried the process further to
roduce sacred symphonies, often using anti-
honal effects.

rama in Music.

Not until the end of the 16th cent. did anyone
egin to think about combining drama and music,
nd so "invent" the new art we know today as
pera. A group of artistic intelligentsia met to-
ether in Florence and conceived the idea of re-
iving the ancient declamation of Greek tragedy.
hey took Greek mythological subjects, cast them
dramatic form, and set them to music, not in
e choral polyphonic style of the Madrigal, but
ith single voices declaiming dialogue in music.
he earliest examples of what was called *Dramma*
r Musica were Peri's *Daphne* in 1597 (now lost)
d his *Eurydice*, in which he co-operated with
ccini. The new style came to its full flowering
ith the appearance of Monteverdi (1567–1643),
hose genius would surely have shone in any age.

Monteverdi's first opera, *Orfeo*, produced in 1607,
a landmark of dramatic expression, and it is
thing less than a catastrophe that so many of
s later operas have been lost. His *Orfeo* pro-
des the basic ground work for the operas of the
xt two centuries: recitative, accompanied re-
ative, and aria. His last opera *L'Incoronazione*
Poppaea, written when he was at the great age
r those days) of 75, succeeds in its aim of creat-
g a free, fluid form, slipping easily from recitative
arioso and even aria without the strict, closed
rms that were to be used in the 17th and 18th
nt. He focusses attention to an almost unbe-
vable extent on characters rather than situation.
creates real people with all their faults and
bles—the kittenish, sexual attraction of
ppaea, the power-drunk, infatuated Nero, the
se counsellor Seneca, and the noble, wronged
press Octavia. As recent productions have
own these characters leap from the musical page
if they had just been created, each unerringly
lineated in musical terms. Only the vocal line,
continuo, and very incomplete instrumental
ornelli parts have been preserved, but in sensi-
e, knowledgeable hands tonal variety in the
ape of wind and string parts can be added, as we
ow certain instruments were available to the
nposer.

Monteverdi's successors were Cavalli (1602–76),
sti (1623–69) and Stradella (1642–82), who gave
solo voice more and more prominence en-
raged by the advent of the castrati's brilliant
ces. These artificially created singers had a
gue and popularity similar to "pop" singers of
lay, fêted wherever they appeared. The aria
came more extended and ornate, and dramatic
isimilitude gradually but inexorably took second
ce to vocal display. An aria was nearly
ays in *da capo* form, the first section being
eated after a contrasting middle one.

teenth- and Seventeenth-century Church Music.

Of course, the invention of a new dramatic style
cted church music too. The concentration on
vertical aspect of music (homophony) as
posed to the horizontal (polyphony) led to the
reasing importance of the voice in religious
sic. In Italy, it is true, there was the late-
vering, great madrigalist Carlo Gesualdo (1560–
4), whose harmonic daring still astonishes us
ay, but by 1600 the cantata was coming to
lace older forms in church music. In its
plest form this was a story told in accompanied
tative. Giacomo Carissimi (*c.* 1604–74) was
of the first significant composers of this new
n. He too was in on the birth of the oratorio,
se forerunner was the *sacra rappresentazione*
stery or miracle play) of early 16th-cent Florence. Then in the mid-16th cent. St. Philip Neri brought in elements from popular plays on sacred subjects in his services in Rome, designed to hold the attention of youth—rather as certain parsons have tried with "pop" services today. Emilio di Cavalieri (*c.* 1550–1662) and Carissimi developed the form adding arias and choral movements, omitting actual representation. Alessandro Scarlatti (1660–1725), whose oratorios bear a close resemblance to his operas, brought oratorio to its zenith in Italy.

Heinrich Schütz (1585–1672), Bach's great predecessor, was the founder of German church music. His historical place has never been called into question but only in recent times have the intrinsic merits of his own music come to be recognised. He studied with Giovanni Gabrieli in his youth and later came under the influence of Monteverdi, so it was not surprising that he brought Italian ideas across the Alps to Germany and wrote the first German opera *Daphne*, now sadly lost. He also introduced his country to the Italian declamatory style and to the new kind of concertato instrumental writing. But his dramatic religious works were his greatest contribution to musical development. He wrote with a devout intensity, bringing to life the scriptural texts by closely allying his urgent music to the words. His three settings of the Passions—Matthew, Luke, and John—paved the way for Bach's even more remarkable works in this genre. Two contemporaries of Schütz, Johann Hermann Schein (1586–1630) and Samuel Scheidt (1587–1654), were both important figures in German Reformation music.

Lully, Purcell, and Seventeenth-century Opera.

France resisted the tide of Italian opera, although paradoxically it was an Italian, Jean-Baptiste Lully (*c.* 1632–87), who charted the different course of French opera which was from the beginning associated with the court ballet. His musical monopoly during the reign of Louis XIV was put to good use. In his thirteen operas the libretto, usually on classical, allegorical themes, plays a vital part in the composition, which is therefore less clearly divided between recitative and aria than in Italian opera. The orchestration and the ballets assume greater importance than in the traditional Italian form. It was, in short, a more realistic, less stylised art.

In England, opera developed out of the entertainment known as the Masque, a succession of dances, accompanied by voices and instruments and often incorporated in a drama or spectacle. Henry Lawes's (1596–1662) setting of Milton's *Comus* is probably the most famous of these entertainments. The *Venus and Adonis* of John Blow (1649–1708) can be called the first English opera because here the music is gradually gaining the ascendancy over the spoken word. However, it was Purcell (1658–95), Blow's pupil, with *Dido and Aeneas*, who really gave dramatic life to the new medium by giving his characters a true musical personality that was subtler than anything the mere spoken word could achieve. The grief-laden lament of the dying Dido "When I am laid in earth" has an expressive power, achieved by extraordinarily bold harmonic effects, never before and seldom since achieved. The opera was in fact written for a young ladies' boarding school. Purcell followed it with several outstanding semi-operas—such as *The Fairy Queen* (to Dryden's text). His untimely death at the age of 36 probably robbed us of several full-length operas—and perhaps a consequence of this was that English music after him did not develop as it should have done.

His verse anthems and much of his instrumental music, especially the Fantasias, are also rich in imaginative mastery through his original use of harmony and counterpoint. However, a great deal of his pieces were written for a specific occasion and many of the odes are set to impossibly trite texts. At least his genius was partly acknowledged in his own day, and he was appointed organist in Westminster Abbey where he was buried with due pomp. He is said to have died through catching cold when locked out of his own house at night.

Vivaldi and the Rise of Instrumental Music.

Out of the dance suites popular in the 16th cent. and the beginning of the 17th (known in Italy as the *Sonata da Camera*) developed the concerto. This began as two groups of instrumentalists compared and contrasted with each other as in Giovanni Gabrieli's *Sonata piano e forte*. With Arcangelo Corelli (1653–1713) the concerto grosso took a more definite shape, alternating a solo group of instruments with the main body of strings in three or more contrasting movements. Guiseppe Torelli (1658–1709), Francesco Geminiani (1687–1762) and Tommaso Albinoni (1671–1750) were other notable contributors to the form, but none of the composers so far mentioned has today achieved the popularity of the priest Antonio Vivaldi (*c.* 1678–1741), himself a violinist, who had at his disposal the orchestra at the Ospedale della Pieta in Venice. The young women at this music school also contributed the vocal side of the concerts there of which there are many descriptions. One says: "They sing like angels, play the violin, flute, organ, oboe, cello, bassoon—in short no instrument is large enough to frighten them . . . I swear nothing is so charming than to see a young and pretty nun, dressed in white, a sprig of pomegranate blossom behind one ear, leading the orchestra, and beating time with all the grace and precision imaginable." For this body, Vivaldi wrote about 500 concertos which maintain a remarkably even quality, of which "The Four Seasons" are perhaps the most felicitous.

Meanwhile organ music was advancing rapidly in technique. Girolamo Frescobaldi (1583–1643) and Jan Pieterszoon Sweelinck (1562–1621) wrote works that provided the foundation of the Italian and Northern German schools of organ music. Their ricercares gradually developed into the fugue, a vein so richly mined by Bach. Among their successors the most notable figure before Bach was Johann Pachelbel (1653–1706).

Other keyboard music, especially for the harpsichord, was the particular province of France and Jean-Philippe Rameau (1683–1764) and François Couperin (1668–1733) were both masters of keyboard style and harmonic invention.

Bach (1685–1750).

The two giant figures of Bach and Handel bestride the first half of the 18th cent. Their differences are perhaps greater than their similarities. Bach wrote essentially for himself (although of course, he had to satisfy his employers at Cöthen and Leipzig) while Handel was composing to please his wide public. Bach was a provincial, always remaining in central Germany; Handel was widely travelled. Bach was devoutly religious, almost ascetic; Handel was more a man of the world. They never met.

To summarise Bach's vast output in a short space is virtually impossible. One can only try to distil the flavour of his music. He brought the art of polyphony to the highest pitch of mastery that has ever been achieved or is ever likely to be achieved. In his famous "Forty-Eight" and "the Art of the Fugue" he explored all the fugal permutations of the major and minor keys. At the same time his music rose above technical brilliance to achieve, especially in his organ music, the two Passions, many of the church cantatas, and the B minor Mass, intense emotional and expressive power. The cantatas, from his Leipzig appointment (1723) onwards, were integrated into the services. They consisted usually of a chorus based on a Lutheran hymn tune, recitatives, several extended arias, and a concluding chorus usually a straightforward version of the hymn tune in which the congregation joined. There are some two hundred of these works and they contain a wealth of comparatively unknown and sometimes even unrecognised beauties. The St. John and the St. Matthew Passion extend these procedures to a grand scale, an Evangelist telling the new Testament story in vivid recitative, the chorus taking the part of the crowd, soloists pondering in arias on the meaning of the Gospel, and Jesus's words being sung by a bass. Anyone who has heard either of these works well performe cannot help but dismiss from his mind any idea o Bach as a mere dry-as-dust musical mathematician. In the St. Matthew Passion, every suggestion in the text that can possibly be illustrated b a musical equivalent is so illustrated. The Ol Testament Pharasaic law is represented by stric musical forms such as the canon; Christ's saying are given noble arioso life; and the arias reflec truly the New Testament's compassionat message. Technically the work is a marvel expressively it is eloquent. The B minor Mass although it contains borrowings from many of hi own works, still stands as a satisfying monumenta whole in which Bach's choral writing achieved new richness, the adaptations being in accord wit their new setting.

Bach's instrumental music, especially the violi concertos and the unaccompanied works for violi and cello, not only show the immense range of hi powers but also contain many of his deepe thoughts, whereas the orchestral suites and th Brandenburg concertos are more extrovert particularly the rhythmically exuberant fas movements.

Bach closes an era—that of the later contrapuntalists—by achieving the *ne plus ultra* in fuga composition; his last, incomplete work, the Ar of the Fugue, is evidence of this.

Handel (1685–1759).

During his lifetime Handel was far more widely recognised as a great composer than Bach, and hi music, unlike Bach's, maintained its place i popular esteem until the re-discovery of Bach an the dominance of the symphony placed Hande somewhat in the background.

During the latter part of the 19th cent. Handel' name was mainly associated with mammoth anachronistic performances of a small sample o his oratorios at the Crystal Palace and elsewhere i England. In his lifetime these works, and all hi other works in the genre, were sung by a smal choir who were outnumbered by the instrumenta players. Over the past few years authentic-size performances of his oratorios and a revival o interest in his operas have revealed the real Handel unknown to our grandparents.

The operas were neglected partly because th vocal prowess they required—and which the castrati so brilliantly supplied—was no longer available and because their dramatic life, at leas according to 19th- and early 20th-cent. tenets hardly existed. Now it is realised that this neglec has deprived us of an unending stream of gloriou melody and of much daring harmony. But perhaps it is in the hitherto disregarded oratorios such as *Semele*, that Handel's innate dramati sense and musical range are to be heard gloriousl fulfilled, and the pastoral serenade *Acis an Galatea* is surely one of the most delightful score ever composed.

Handel was a colourful, imaginative orchestrator, and this can be heard both in his accompaniment to vocal music and in his concerti grossi, op 3 and 6, the earlier set exploiting a diversity o interesting string and wind combination. In hi writing he was at home in a polyphonic or homophonic style as his superb choruses show. Hi organ concertos, of which he was the "inventor" (to quote a contemporary source), were ofte played between the acts of his oratorios. The are alternately expressive and exuberant piece calling for some virtuosity from the player. Hi occasional works, such as the Water Music an Fireworks Music show his ingenuity in extendin the range of the typical 17th cent. suite to serve particular occasion.

Handel's working life was mostly spent i England where his Italian operas were acclaimed In the years between his arrival here in 1711 an 1729 he wrote nearly thirty operas. It was onl when the public tired of these and his reputatio slumped that he turned to oratorio with equa success.

Bach and Handel between them crowned the age of polyphony that had lasted for two hundred years or more. After them, it is hardly surprising that composers began looking for a new style, already anticipated in the music of Rameau and particularly Dominico Scarlatti (1685–1737), whose harpsichord sonatas foreshadowed the classical sonata form that was to dominate music for the next two hundred years. The change in musical style about 1750 was partly the result of a change in musical patronage. Bach was the last great composer to earn his living through being employed by the church. The new patrons were the nobility who liked to have a composer on hand to write for the various evening entertainments of the time. For this purpose the princes and dukes had their own orchestras and their own small opera houses. The music required had to be elegant, formal, *galant*. Haydn was exceptionally fortunate in having an employer, Prince Nicholas of Esterhazy, who allowed him to write more of less as he wished so that he was able to develop symphonic form into something more than a pleasing way of passing an evening.

The early symphonists, culminating in Haydn, broke away from Bach's contrapuntal treatment of the orchestra. Instruments now came to be treated in a more colourful manner according to their particular timbre. The court of Mannheim had an orchestra of a standard unheard hitherto, and Johann Stamitz (1717–57) and his son Karl (1745–1801) influenced the great composers who were to follow in their footsteps. The composition of their orchestra was flexible, oboes, flutes, and horns often being added to the standard string section. Bach's son Carl Philipp Emanuel (1714–88) added to and developed symphonic and sonata form, especially as regards keys and subjects.

Haydn and Mozart.

These two figures dominate the second half of the 18th cent. as Bach and Handel did the first. In a brief space only a general picture can be presented of their huge output and influence. Of Haydn's 104 symphonies (there may even be others) more than half are worthy of study and hearing. The craftsmanship is always remarkable, the invention ever new. Indeed without Haydn's harmonic daring or his melodic ingenuity, the even greater symphonic thought of Beethoven would have been impossible: Haydn laid the groundwork on which his successor built towering edifices. A work such as the 93rd symphony in D is typical of his mature style with ts searching introduction, powerfully wrought, earnestly argued first movement, beautiful *Largo* and resourceful bustling finale. Haydn did not ight shy of contrapuntal writing: the development section of this symphony's first movement and the finale are evidence of that, but it was only as an integral part of a predominantly homophonic echnique.

Mozart's symphonies are not so different in orm from Haydn's but—and this must be a subective judgment—he put more emotional feeling nto his. Nobody could listen to the heart-earching first movement of his 40th symphony without being deeply moved. It was in his final hree works in the medium that Mozart brought his symphonic art to perfection, and these obviously had an effect on Haydn's later symphonies written after them. For passion and tenderness ontained within a classical form these late symphonies, and many other of Mozart's works, have yet to be surpassed.

Haydn, who has been rightly termed "the father of the Symphony" was also the founder of he string quartet—perhaps the most perfect, ecause the most exactly balanced, form of musical xpression. The four instruments—two violins, iola, and cello—discuss, argue, commune with ach other over the whole gamut of feeling. In is quartets Haydn's mastery of structure is even ore amazing than in his symphonies. Mozart's uartets (especially the six devoted to Haydn) nd even more his quintets achieve miracles of eauty in sound, nowhere more so than in the first ovement of the G minor (his most personal key) quintet. The two late piano quartets show how the piano *can* be ideally combined with strings. His clarinet quintet is also a masterly work.

Haydn did not leave any concertos of consequence. Mozart's, especially those for piano, are among his greatest works. As a brilliant clavier player himself, he showed a consummate skill in writing for the keyboard. Although the instrument he knew was slightly less advanced than the piano today, his concertos call for virtuosity in execution, yet they are as searching in emotional content as the late symphonies and quartets. Indeed the C major concerto (K. 467) and the C minor (K. 491) may be said to hold the quintessential Mozart. As well as twenty (mature) piano concertos, Mozart wrote six for the violin, four for the horn, and eighteen others, but none of these delightful as they are, can be placed in quite the same class.

Of their church music, Haydn's sixteen masses and his oratorios—*The Creation* and the *Seasons* (both late works)—are perhaps more worthy of attention than Mozart's various masses, but we must not forget Mozart's final work—the Requiem or the serene late Motet *Ave Verum Corpus*.

Eighteenth-century Opera.

Mozart—for many the first great opera composer—did not, of course, create his masterpieces out of nothing. In France, Lully was followed by Rameau (1683–1764), who carried on his tradition of using classical themes but developed a more flexible style of recitative and greatly increased vividness of expression. But it was Gluck (1714–87) who more than anyone broke out of the straitjacket of the now ossified Italian form of opera—dominated by the singer—and showed just what could be achieved in moving human terms. Drama in music really came of age with his *Orfeo e Eurydice* (1762), *Alceste* (1767) and *Iphigénie en Tauride* (1779). His simplicity and poignancy of expression were not lost on Mozart.

Meanwhile in Germany a kind of opera called *Singspiel* appeared during the 18th cent. Breaking away from classical themes, mundane stories were told in dialogue and music.

Until quite recently Haydn's operas were dismissed as unworthy representations of his genuis but, chiefly through the enlightening efforts of the Haydn scholar, H. C. Robins Landon, some of his fifteen surviving works in the medium have been successfully revived. They have proved to be perfectly viable for the stage and, especially in the ensembles, full of that delightful invention to be found in the rest of his opus, if on a less fully developed scale. Still as musical drama they inevitably fall far short of Mozart's achievements, for the younger composer seems to have had an instinctive feeling for the stage. Into his operas he poured his most intense, personal music. He vividly portrays the foibles, desires, loves, and aspirations of mankind.

The earlier, immature stage pieces of his youth led to such works as *Lucio Silla* (1772) and *La Finta Giardiniera* (1775) with their first glimpses of the glories to come. His first indubitably great opera is *Idomeneo* (1781). Despite its unpromisingly static plot, *Idomeneo* reveals Mozart's stature through its ability to breathe new life into a conventional *opera seria* form. Though influenced by Gluck it is yet more human and touching in its musical expression. To succeed this Mozart wrote a much more frivolous piece *Die Entführung aus dem Serail*. Stemming from the *Singspiel* tradition, it none the less creates real-life characters who have much charming music to sing.

After three lesser pieces Mozart embarked on his four masterpieces—*Le Nozze di Figaro* (1786), *Don Giovanni* (1787), *Cosi fan tutte* (1790), and *Die Zauberflöte* (1791).

Figaro, as well as being a delightful comedy, explores more fully than any previous opera situation and character, which find expression in beautiful arias and in two finales of symphonic proportion. In *Don Giovanni*, less satisfactory as a dramatic structure, the range of musical characterisation and insight into human motives is widened still further. *Così* lyrically but humorously expresses the follies of love. Mozart could not help but love his characters and his music for them is at one and the same time amusing and heartfelt. *Die Zauberflöte*—The Magic Flute—displays Mozart's deep-felt love of his fellow men and of truth in an opera of great spiritual strength. Nor has opera any more loveable personality than the birdcatcher Papageno. Mozart's final opera *La Clemenza di Tito*, extolling imperial magnanimity, has never achieved the success or popularity of his other maturer stage works, though it contains much excellent music.

Beethoven.

Mozart was the last major composer to depend, to any large extent, on private patronage for his living, and even he left the service of the Archbishop of Salzburg because he could not stand the restrictions imposed on his freedom. Henceforth composers would have to stand on their own two feet with all the advantages (liberty) and disadvantages (lack of security) that implied. Beethoven (1770–1827) was the first such composer of importance.

Although his work is usually divided into three periods, this division is somewhat too arbitrary, for no other composer in history, with the possible exception of Wagner, has shown such a continual development of his genius. Coming at just the right moment in musical history, he crowned the achievements of Haydn and Mozart with music of the utmost profundity of thought and feeling that looks back to its classical heritage and forward to the romantic movement of the 19th cent. His influence on musical thinking and writing is incalculable.

His first period shows his strong melodic gifts and the beginning of his individuality in developing form and structure to suit his own ends and match his particular genius. Unusual keys are explored, unusual harmonic procedures employed. With the "Eroica" (his third symphony) he established his position as a great composer. The unity of purpose he here achieved within a long and diverse structure is truly staggering, even today. In the first movement alone the structural invention and cogency went far beyond what even Mozart had achieved in his "Jupiter" symphony, and the second movement—a vast funeral March—has an overwhelmingly tragic emotional content. But the "Eroica" was followed by six equally great symphonies, each one as varied, as inventive, as unified as the others. The ninth symphony is significant in both its length and finale. Here Beethoven crowns three superb instrumental movements with a choral movement that, as well as summing up all that has gone before, expresses in music the joy in existence more ecstatically than any other work.

The burning intensity of Beethoven's genius is just as evident in his chamber music. His quartets are the product of a revolutionary age in which the social graces and formal restraint of the 18th cent. were thrown off in a search for a more personal mode of expression. The early op. 18 set, and the Razoumovsky quartets, op. 59, go even beyond the range of Haydn's and Mozart's works in the medium but it was in his late quartets, his final musical testament, that Beethoven refined and distilled his art for posterity. No words can possibly describe their unique quality, but any and every chance should be taken to make their acquaintance: the effort required will be more than amply rewarded.

The early piano concertos do not reach quite this level of attainment, but the last three, together with the violin concerto, are on a par with the finest of the symphonies and quartets, as well as being considerable tests of the performers' technique. The Triple Concerto for piano, violin, and cello is an unusual and rewarding work.

Beethoven's grandest choral work—and one of the most noble in existence—is the Mass in D (*Missa Solemnis*). Its vast scale and sublime utterance often defeat performers, but when it is successfully done there is no more spiritually uplifting experience for the listener. Except perhaps Beethoven's only opera, *Fidelio*. This simple escape story was transformed by Beethoven's creative fire into a universal symbol of liberty, the composer identifying himself with the struggle for freedom from tyranny and release from darkness.

Beethoven lived in a period of war and revolution. A passionate belief in the brotherhood of man and in liberty, he was shocked to find his ideals thrown over by revolutionaries-turned-dictators. His own tragedy of deafness, which came upon him at the moment of his triumph, nearly submerged him, but in the end he won through and produced the string of masterpieces from the "Eroica" onwards. Hope springing from despair, love from hatred, victory over defeat, these are the unquenchable legacies left by Beethoven.

The Romantic Movement.

Inevitably, the Romantic movement in literature that burst forth about 1800 was bound to have its counterpart in music. And so it was. Breaking the classical bonds, composers such as Schubert, Schumann, Liszt, and Berlioz sought a new freedom in musical expression. Form became of less importance than content; and that content often had literary connections. For their purposes a larger orchestra was needed and supplied, but the miniature, the song especially, because of its very personal connotation, was also a favourite form.

Schubert (1797–1828)—described by Liszt as "the most poetic of musicians"—is perhaps the greatest lyrical genius in musical history. In him the Viennese tradition and influence of Haydn, Mozart, and Beethoven reached its zenith. The song was always Schubert's starting point, so it is hardly surprising that his reputation as a song writer has never been impaired but in his symphonic and instrumental works too it is always his inexhaustible fund of melody that first calls for attention. Nobody could listen to his "Trout" quintet, for piano and strings, his octet, his fifth symphony, or his song cycle *Die Schöne Müllerin* without being enchanted and invigorated by the sheer tunefulness of the music. But there is much more to Schubert than this: his understanding of the possibilities of harmonic change, his grasp of orchestral coloration (in the great C major symphony, for instance), his free use of sonata structure.

Although Mozart, Haydn, and Beethoven had all contributed to the song as an art form, it was with Schubert that it achieved its first full flowering. If he had written nothing but his songs, his place in the musical firmament would be assured. With his *Erlkönig* in 1815 the German *Lied* came of age and from then until the end of his life he wrote more than six hundred songs, hardly a dud among them. Whether it is the charm of *Heidenröslein*, the drama of *Der Doppelgänger* or the numbed intensity of the *Winterreise* cycle Schubert unerringly went to the heart of a poet's meaning; indeed he often raised poor verses to an inspired level by his settings. And for the first time the pianist shares a place of equal importance with the singer.

There is only room to mention one or two other composers, some of them wrongly neglected, who were roughly contemporaries of Beethoven and Schubert: the Czech Dussek (1760–1812), who like Beethoven bridges the classical–romantic gulf, Boccherini (1743–1805), the two Italian opera composers Cimarosa (1749–1801) and Paisiello (1740–1816), the Frenchman Méhul (1763–1817) and the German Hummel (1778–1836).

Weber (1784–1826) lacked Beethoven's energy and constructive powers and Schubert's sheer lyrical profundity, but he is an important figure, especially in the field of opera, where his *Der*

Freischütz and *Oberon* led the way to a more flexible, dramatically realistic form of opera. His vivid imagination exactly fitted the new romantic mood abroad. The sheer beauty in the melodic shape of his music is also not to be denied.

Mendelssohn and Schumann.

Mendelssohn (1809–47) was the civilised craftsman among the Romantic composers. A boy genius—many of his finest works were written before he was twenty—he maintained the importance of classical form while imbuing it with his own affectionate brand of poetic sensibility. His third and fourth symphonies—the "Scottish" and "The Italian"—(and possibly the fifth "The Reformation"), his string quartets (some of which go deeper than most of his music), violin concerto, first piano concerto, and of course, the incidental music to "A Midsummer Night's Dream" represent his tidy yet effervescent style at its most winning.

Schumann (1810–1856) is less easy to categorise. His early romantic flame was burnt out by some flaw in his intellectual and/or emotional make-up, and his inspiration seems to have declined in later years. No matter, by then he had given us the marvellous song cycles of 1840, an ever fresh piano concerto, many fine piano solos, including the mercurial, popular *Carnaval* and several symphonies, which, if not structurally perfect, contain much lovely music. The joys and sorrows of love and the feeling for natural beauty are all perfectly mirrored in these charming, lyrical works.

Romantic Giants.

Berlioz (1803–69) and Liszt (1811–86) are the two most typical representative figures of the Romantic era. Both have always been controversial figures, with ardent advocates and opponents either unduly enthusiastic or unfairly derogatory. Berlioz might be termed the perfect painter in music. With an uncanny mastery of orchestral sound he could conjure up the countryside, the supernatural and the historical with the utmost ease. He based his music on the "direct reaction to feeling" and a desire to illustrate literature by musical means. That his technical expertise was not always the equal of his undoubted genius, can be heard in many of his larger works such as the dramatic cantata *The Damnation of Faust* and the dramatic symphony *Romeo and Juliet*, yet most people are willing to overlook the occasional vulgarity for the ineffable beauty of his many fine pages, but brutal cuts in his music, such as are often made in, for instance, his epic opera *The Trojans* only have the effect of reducing the stature of his works. We must accept him, warts and all. Anyone who has seen the two parts of *The Trojans*, presented complete in one evening at Covent Garden, will realise that Berlioz knew what he was about.

His output is not quantitatively large but includes several monumental works, as well as *The Trojans*. The *Requiem* ("Grand Messe des Morts") requires a tenor solo, huge chorus and orchestra, and brass bands, although Berlioz uses hese forces fastidiously. The *Symphonie funèbre t Triomphale*, calls in its original form, for choir, brass, and strings. But Berlioz was just as happy writing on a smaller scale as his exquisite song ycle, to words of Théophile Gautier, *Nuits d'Été*, hows. Gautier perhaps summed up better than nyone Berlioz's singular talent: "In that enaissance of the 1830s Berlioz represents the omantic musical idea, the breaking up of old moulds, the substitution of new forms for unvaried quare rhythms, a complex and competent richess of orchestration, truth of local colour, unxpected effects in sound, tumultuous and hakespearian depth of passion, amorous or melancholy dreaminess, longings and questionings f the soul, infinite and mysterious sentiments not o be rendered in words, and that something more han all which escapes language but may be ivined in music."

During his lifetime Liszt was fêted and onoured not only by his musical colleagues but by the world at large, which idolised him and his piano. Then his reputation took a plunge from which it has only recently recovered. To be sure much of his early music is glitter and gloss, but his symphonies and tone poems—especially the Faust Symphony, the Dante Symphony (both, of course, inspired by literature), and *Orpheus* and *Prometheus*—and his late piano works show that he was an extraordinary harmonic innovator. The piano sonata in B minor brings his romantic, wilful temperament within a reasonably stable, pianistic form, and as such is a landmark in the repertory of the instrument. Liszt's output was prodigious, but the inquiring listener should explore the more original of his compositions already mentioned to form a true picture of his fertile genius.

Chopin.

Chopin (1810–49) was the master of the keyboard, par excellence. His development of the technical and expressive capabilities of the piano is unique in musical history. His inventive powers were poured out with nervous passionate energy and in a highly individual style through twenty astonishing, possibly agonised years of creative activity before his early death. A Chopin melody, limpid, transparent, singing, can be recognised easily by anyone, but his style gradually developed into something more subtle, more satisfying than pure melody. He took the greatest care of every detail so that any alteration, however small, upsets the perfect balance of his work. His poetic sensibility can be found in any of his works; for his constructive ability we must turn to the Ballades, the B minor Sonata, and the Barcarolle, while the Preludes and Studies blend technical powers and emotional expressiveness in ideal proportions.

Nineteenth-century Opera.

After Mozart's operas and Beethoven's *Fidelio* the medium might have been expected to decline. Instead it took on a new, if different, lease of life that culminated in Verdi's extraordinary output.

Rossini (1792–1868) created a world of exuberant high spirits in his operatic works that are as cheerful and heart-warming today as they were a hundred or more years ago.

He always worked in and around the lyric theatres of Italy and between 1810 and 1830 poured out a stream of works, not all of which can be expected to be masterpieces. However, *Il Barbiere di Siviglia*, *L'Italiana in Algieri*, *La Cenerentola* and *Le Comte Ory* will always delight audiences as long as opera houses exist. Although these works are difficult to sing really well, their vitality and charm can never be submerged even by poor voices or indifferent staging.

His German contemporaries were critical of his confidence and frivolity, but his works show a consistency of invention and an irresistible tunefulness that anyone might envy. In recent years, there has also been a renewed interest in his more serious operas—*Otello* (1816), *La Gazza Ladra* (1817), *Semiramide* (1823), *La Siège de Corinthe* (1820), and *Guillaume Tell* (1829)—which were certainly surpassed in dramatic power by his successors but which nevertheless are not to be despised or neglected.

William Tell, to give it its more popular title, was his last work for the stage although he lived on for nearly forty years in retirement in Paris, scene of many of his greatest successes. There he enjoyed good living, dispensing *bons mots*, and occasionally composing trifles. An exception is the unpretentious *Petite Messe Solennelle*, written originally for soloists, chorus, a harmonium, and two pianos. Rossini later orchestrated it, but he would not allow it to be performed during his lifetime. The first public performance was on 28 February 1869, as near as possible to the 78th anniversary of the composer's birth on Leap Year Day 1792.

In contrast to the mercurial Rossini, Vincenzo Bellini (1801–1835) was an exquisite, romantic figure dealing with exquisite, romantic stories, an operatic equivalent to Chopin, who much admired him. His delicate, sinuous vocal line (in the arias) and brilliant acrobatics in the final sections (cabalettas) require singers of the utmost accomplishment to do them justice, although his music is never as florid as Rossini's. His most typical and popular works are probably *La Sonnambula* (1831), *Norma* (1831) and *I Puritani* (1835). The first is a tender, homely country story, the second an almost heroic lyrical drama of sacrifice, and the third a rather unsatisfactory historical story redeemed by its appealing music. In the past few years singers of the calibre of Maria Callas, Joan Sutherland, Guiletta Simionato, and Marilyn Horne have brought Bellini's operas a popularity almost equal to that they enjoyed at the time they were written.

Gaetano Donizetti (1797–1848) was an even more prolific operatic composer than Rossini. He wrote at least 75 works, mostly for the Italian stage, several of which, such as *Alfredo il Grande* or *Emilia di Liverpool*, are never likely to be revived, but during the past few years, with the renewed interest in what are called the *Ottocento* operas, many of his serious operas have been resuscitated and found as enjoyable in performance as his more frequently heard comedies.

He was a well-grounded musician and although his invention is often criticised for being too tied to the conventions of his day performances often belie this reputation, his dramatic instinct proving sure. *Lucia di Lammermoor*, because of the chances it offers to a coloratura soprano with tragic pretensions, has always held the stage and of late *Lucrezia Borgia*, *Anna Bolena*, *La Favorita*, and *Poliuto* have all been successfully revived. Of his lighter works, the comedies *L'Elisir d'Amore* and *Don Pasquale* have never declined in popularity. One of his last works was *Linda di Chamounix* (1842) which he wrote for Vienna where it aroused such enthusiasm that the Emperor appointed him Court Composer and Master of the Imperial Chapel.

French Opera.

The taste in Paris was for more and more lavish productions. Following Spontini (1774–1851), whose works were comparatively austere, came Halévy (1799–1862) and Giacomo Meyerbeer (1791–1864) whose operas contain all the ingredients that came to be expected of "Grand Opera"—spectacle, huge ensembles, showpieces for the soloists, and extended, if superfluous ballet. Drawing from Italian, German, and French traditions Meyerbeer's music contained everything the public wanted, yet today they are seldom revived, perhaps because his creative powers were essentially derivative, yet when they *are* given, operas like *Les Huguenots*, *Le Prophète*, and *L'Africaine* still have the power to fascinate and his influence on his successors, notably Wagner, was considerable.

Verdi.

Italian opera in the 19th cent. culminated in the works of Giuseppe Verdi (1813–1901), who rose from a peasant background to become his country's most noted composer, as well as something of a natural hero during the period of the Risorgimento. His earliest works, indeed, often roused his hearers to patriotic fervour. For instance, *Nabucco* (1842), with its theme of an oppressed people seeking deliverance, was treated as a symbol of the Italians' fight for freedom.

Musically, Verdi developed out of all recognition during the course of his long career. The continuously flowing structure of his last two operas *Otello* and *Falstaff* is very far removed from the start–stop formulas, inherited from his predecessors, of his first works, yet even they are touched, in harmonic subtleties, orchestral felicities, and a sense of drama, by a spark of genius, a burning inspiration that sets him apart from all other operatic composers. *Ernani* (1844), *I due Foscari* (1844), and *Luisa Miller* (1849) all have foretastes of glories to come even if as a whole they are flawed dramas, and these "galley years", as Verdi himself later described them, gave him the essential know-how to produce his later, greater operas, as well as establishing him incontrovertibly as the most popular Italian composer of the time.

However, it was with *Rigoletto* (1851), *Il Trovatore* (1853), and *La Traviata* (1853) that Verdi first really staked his claim to immortality. In these pieces his increasing dramatic mastery are married to a wonderful flow of lyrical melody, at the same time controlled by a fine musical sensibility. They were followed by four operas—*Simon Boccanegra* (1857), *Un Ballo in Maschera* (1858), *La Forza del Destino* (1862), and *Macbeth* (revised version, 1865)—in which Verdi overcame complexities of story line by his continually developing musical powers. This period is crowned by *Don Carlos* (written for the Paris Opéra, 1867) a masterly exercise in combining private and public situations in a single, grand, and characterful work. In some respects Verdi never surpassed the subtlety of his writing in this opera. *Aïda* (1871) carried on the process but the characterisation in this ever-popular piece is less refined than in *Don Carlos*, if the grandeur of the design is more spectacular.

The success of *Otello* (1877) owes nearly as much to the skill of Boito whose literary ability combined with musical knowledge (he was himself a composer) presented Verdi with an ideal libretto for his seamless music in which the drama moves inevitably to its tragic end. Recitative, aria, ensemble are fused in a single, swiftly moving music-drama, which in its very different way equals that of Wagner. *Falstaff* (1893) achieves the same success in the field of comic opera, a brilliant, mercurial ending to a distinguished career. If Verdi had written only these two final masterpieces his place in musical history would be assured.

Brahms.

Brahms (1833–1897) has justly been described as "a romantic spirit controlled by a classical intellect," for while complying with most of the formal regulations of sonata form he imbued them with an emotional content that accorded with his time. Indeed Schumann declared that he was the "one man who would be singled out to make articulate in an ideal way the highest expression of our time."

Perhaps in his chamber music will be found the quintessence of his art. The piano and clarinet quintets, the two string sextets, the horn trio, and the violin sonatas all are designed on a large scale yet the expression remains intimate, the design and structure clear.

The symphonies and concertos, though, remain his most popular works; they are part of the solid repertory of every orchestra and most piano and violin players in the world. Their high seriousness, constant lyrical beauty, and control of form are deeply satisfying. They do not provide the extremes of passion and excitement provided by his contemporaries, but their study provides continuous absorption and delight. The double concerto for violin and cello deserves a mention as a unique work in music.

Brahms wrote more than two hundred songs in which the desire for melodic beauty takes precedence over the words and meaning. Many are set to poor poetry, but hidden away are still some unexplored treasures, and the Four Serious Songs, at least, are tragic masterpieces. In a lighter vein the two sets of *Liebeslieder Walzer* for four voices are irresistible. The choral Requiem, too, is a fine work.

Bruckner.

In recent years Bruckner's reputation *vis-à-vis* his great contemporary Brahms has been enhanced in England. The old conception of him s a naïve Austrian unable to grasp the fundamen- ls of symphonic architecture has died hard, and ie prevailing popularity of his grandest works is ; last gaining him his rightful place in the 19th- ent. firmament. The nine symphonies and the asses are his chief claim to immortality. They ntain melodies of unforgettable beauty, sym- honic paragraphs of unparalleled grandeur, and 1 appreciation of formal development that, ough different, is as equally valid as that of rahms. The movements of his symphonies are ng and he often pauses, as if for breath and to lmire the scenery, before he reaches the climactic eak of his musical journey. His idiom is best pproached by a newcomer to his work through ie fourth and seventh symphonies as they are rhaps the easiest to understand, but the fifth, xth, eighth, and ninth (unfinished) are just as eautiful—and cogently argued—once one has quired the knack, so to speak, of listening to his usic. Most of these works are now to be heard their original form, stripped of the veneer of improvements" suggested to the diffident mposer by his friends.

As well as the masses, which translate Bruck- er's symphonic ideas to the choral plain, Bruck- er's delightful string quintet is worth investigat- g.

agner.

Praised only this side of idolatry by his ad- irers, unmercifully criticised by his detractors, ichard Wagner (1813–83) is perhaps the most ntroversial composer in musical history. And it was bound to be with such a revolutionary gure, whose writings, other than his music, con- in, to say the least, dubious theories and whose eras, composed to his own libretti, broke the nds of the form as known until his time. He garded music-drama as a fusion of all the arts— usic, literature, painting—in one unity. With *he Ring of the Nibelungs* he achieved his purpose; other work of art has ever tried to encompass e whole of existence. Today, and surely for- er, musicians, philosophers, and writers will gue over its meaning, and each age will rein- rpret it according to its own lights.

But before he reached this pinnacle of achieve- ent, Wagner gradually transformed opera— rough *Rienzi*, *The Flying Dutchman*, *Tann- user*, and *Lohengrin*—so that a new mould was shioned to take what he wanted to pour into it. e introduced the *Leitmotiv*, a musical theme that uld be associated with a particular person, uation, or idea, each time it occurred. Slowly developed the musical form so that the drama uld unfold continuously without breaks for ias. By the time he began to write *Tristan and olde* and *Die Meistersinger*, he had perfected his ethods and had he never undertaken *The Ring* at tragedy and that comedy would have assured n his place in the musical firmament. Indeed, *e Meistersinger* is considered a masterpiece even those who are not willing or prepared to accept e rest of the Wagnerian ethos.

The length and complexity of these operas, and *Parsifal*, a work of unique beauty in spite of tain *longueurs*, means that it is almost essential prepare oneself by homework, with libretti and cords, before attempting to assimilate them in e opera house. The added effort is well worth ile for the ultimate musical satisfaction they ng because Wagner was more than an operatic ormer: he opened up a new harmonic language pecially in the use of chromaticism) that was ically to develop into the atonality of the 20th nt.

olf.

As Wagner was the culmination of the 19th it. symphonic and operatic tradition, so Hugo olf (1860–1903) summed up, if he did not sur- ss, the achievements in song-writing of Schubert humann, and Loewe (1796–1869).

Wolf was a lonely pathetic man. He lived ch of his life in poverty, and eventually lost his reason and died of an incurable disease. These circumstances account perhaps for his almost feverish bursts of creative activity, which were also the outward sign of his burning genius. His greatest contributions to the art of *Lieder* were his extraordinary insight into the poet's meaning and the harmonic means by which he heightened the expression of the words. He raised the importance of the piano part even higher than had Schumann, and in some of his songs the vocal part takes the form of a free declamation over a repeated idea in the piano. However, in the main the vocal and piano parts are interweaved with great subtlety, and he unerringly matched the very varied moods of the poems he chose to set. His greatest creative period was between early 1888 and early 1890 when songs poured from his pen daily—more than 50 settings of the German poet Mörike, 20 of Eichendorff, more than 50 of Goethe, and more than 40 of Heyse and Geibel (the Spanish Song-book). Later he composed songs from Heyse's Italian Song-book and the three Michelangelo sonnets. And the range of his creative understanding was wide, taking in the almost wild passion of the Spanish songs, the humanity and humour of the Italian love-songs, the titanic power of *Prometheus* (Goethe), the varying moods of the Mörike book, and the intangible power of the Michelangelo sonnets. There are almost inexhaustible riches here for the inquiring mind to discover. Outside Lieder, Wolf's output is small, but it includes a sadly neglected opera, *Der Corregidor*, the Italian Serenade for string quartet (alternatively for small orchestra) and a tone poem *Penthesilea*.

Ernest Newman, his greatest champion, summed up his work most aptly: "Wolf practically never repeats himself in the songs; every character is drawn from the living model. It is a positively Shakespearian imagination that is at work—Protean in its creativeness, inexhaustibly fecund and always functioning from the inside of the character or the scene, not merely making an inventory from the outside."

National Movements.

During the course of the 19th cent., alongside the emergence of national political identity, came the rise of nationalism in music, fertilising traditional Western—that is basically German—musical forms with folk material. Of these groups the Russian is certainly the most important, if not the most vital.

Glinka (1804–57) was the first important Russian composer of the national school and, although his two operas *A Life for the Tsar* (sometimes called *Ivan Susanin*) and *Russlan and Ludmilla* are strongly influenced by Italian models, they do introduce Russian song and harmony into the texture. He undoubtedly influenced Borodin (1833–87), Cui (1835–1918), Balakireff (1837–1910), Mussorgsky (1839–81) and Rimsky-Korsakov (1844–1908)—the so-called "Five" of 19th-cent. Russian music. However, each was very much of an individualist too. Borodin was a lecturer in chemistry who wrote in his spare time. His two symphonies, two string quartets led up to his most notable work, the opera *Prince Igor*, left incomplete at his death. Balakireff, friend and adviser to the rest of the group, wrote little himself, but his orchestral works and the piano fantasia, *Islamey*, are worthy of investigation.

Modest Mussorgsky (1839–81) is today seen as the most important and inspired of "The Five." More than the others he used Russian song and Russian speech as the basis of his operas in which he portrayed the lives and destinies of his own people. Although his capacities were seriously impaired by an uncongenial job, poverty, and drinking, he produced two great operas, *Boris Godunov* and *Khovanshchina*, and another *Sorochintsy Fair* that is immensely enjoyable. *Boris* should be given in its original, with spare orchestration, but more often than not it is heard in Rimsky-Korsakov's more elaborate revision. In any case the opera exists in various versions, none of them necessarily the right one: what is important is to hear it in one or the other because of its great portrayal of Boris's personality set against the background of the Russian people, unforgettably presented in choral outbursts. *Khovanshchina* was completed by Rimsky-Korsakov, *Sorochintsy Fair* by Tcherepnin (although other versions also exist). Mussorgsky's songs explore a new vein of naturalistic vocal declamation. Each of the four *Songs and Dances of Death* is a miniature drama worthy of Wolf, although of course in a quite other idiom. The *Nursery* songs miraculously conjure up a child's world as seen from a child's point of view. Many of the individual songs, the *Sunless* cycle too, should be investigated.

Rimsky-Korsakov (1844–1908) is perhaps a less attractive figure because so much of his music seems heartless or merely decorative, but this judgment is probably made on the strength of hearing *Shéhérazade* and the *Capriccio Espagnol* a few too many times. Such of his 15 operas that are played evince a (literally) fantastic mind and lyrical vein, and it is a pity that *Sadko*, *The Snow Maiden*, and *The Tsar's Bride*, at least, are not heard more often.

Tchaikovsky.

Peter Ilyich Tchaikovsky (1840–93) is a more universally admired figure than any of "The Five" and his music is indubitably closer to the mainstream than theirs in that it adheres more nearly to Western European forms. His popularity is due to his unhesitating appeal to the emotions and to his tender, often pathetic melodic expression. His lyrical gift is stronger than his sense of architecture, as he himself admitted. Yet his later symphonies—the fourth, fifth, and sixth (the *Pathétique*)—are all cogently enough argued and invigorating, as can be heard in the hands of a conductor willing to emphasise their formal power rather than their tendency towards sentimentality: the orchestral craftsmanship is also superb. The three piano concertos and the violin concerto offer rare opportunities for virtuoso display within a reasonably dramatic structure and his various overtures are always exciting to hear.

The three ballets—*The Sleeping Beauty*, *Swan Lake*, and *Nutcracker* show Tchaikovsky's skill on a smaller and perhaps more congenial scale, but only two of his operas—*Eugene Onegin* and *The Queen of Spades*—survive in regular performance. They demonstrate his ability to delineate character and his always eloquent melodic invention. His songs often felicitously capture a passing mood or emotion.

Bohemia (Czechoslovakia).

The Czech national school is dominated by two composers—Smetana (1824–84) and Dvořák (1841–1904). In his own country Smetana holds a unique position as the father of his country's music—which is remarkable when you consider that he lived in a country that was then under Austrian rule and never spoke the Czech language perfectly. Yet his music is filled with the spirit of Czech history and national life, and many of his operas, his most important contribution, deal purely with national subjects. The reawakening of interest in things national, after Austria's defeat by Italy in 1859, led to the establishment of a Provisional Theatre in 1862 and Smetana's first opera *The Brandenburgers in Bohemia* was produced there in 1866, but its success was eclipsed by the enormous popularity of *The Bartered Bride*, which appeared the same year. Its melodic charm, lively characterisation and cosy humour have carried it round the world and it is the one Smetana opera to be in the repertory of most opera houses. However, his next opera *Dalibor* (1868) is considered by some authorities as his masterpiece. It is conceived on a heroic scale, and frequently rises to great dramatic heights. His later operas include *Libuše* (1872) a solemn festival tableau, *The Two Widows* (1874), a delightful comedy, *The Kiss* (1876), *The Secret* (1878), and *The Devil's Wall* (1882).

His main orchestral work *Má Vlast* (M
Country), written between 1874 and 1879, is
cycle of six symphonic poems nobly depicting th
life and legends of his country. He wrote onl
three mature chamber works—an elegiac pian
trio, written in 1855 in memory of the death of hi
eldest daughter, and two string quartets, bot
autobiographical. The first in E minor (1876)—
"From My Life"—tells of his youth and aspira
tions until a terrible, screeching E in *altissim*
describes the onset of deafness; the second in
minor, sadly neglected, was described by th
composer as an attempt to explain the "whirl
wind of music in the head of one, who has lost hi
hearing," and was probably influenced by Beet
hoven's later music.

Dvořák combined a fecund melodic gift with a
intelligent grasp of structure. His symphonie
and chamber music are mostly written in classica
form, yet the works are imbued with a spon
taneity and freshness that have not lost one whi
of their charm over the years.

He wrote nine symphonies and, although onl
the last three or four are regularly performed, the
are mostly mature works, several of which, fo
instance No. 7 in D minor (formerly known a
No. 2) reach a tragic grandeur at times. They ar
all orchestrated in a masterly way and are full o
delightful detail. Dvořák wanted to show that
Brahms could come out of Bohemia—and h
succeeded in doing so while maintaining a de
finitely individual flavour, strongly influenced b
natural rhythms.

He wrote three concertos, one each for piano
violin, and cello. The earlier ones are interestin
without being quite in the first flight of the com
poser's output, but the cello concerto of 1895 i
perhaps the composer's crowning achievement—
warm, mellifluous, romantic.

He wrote chamber music throughout his lon
creative life. Some of the early works are wea
and derivative, but the later string quartets, th
"Dumky" trio, and the piano quartet an
quintet are expressive and full of unforced inven
tion. Dvořák felt himself somewhat hampere
when setting words, nevertheless his *Stabat Mate*
and *Te Deum* are both deeply felt choral work
and he wrote songs throughout his career, many o
them very fine indeed. He wrote ten operas, bu
only *Rusalka* (1901) has gained a foothold outsid
Czechoslavakia.

Janáček.

The Moravian composer Leoš Janáček (1858–
1928) spent most of his life in Brno as a workin
musician. His music has recently come to b
recognised as some of the most original written i
the past hundred years. His operas, in which h
closely followed the inflection of the speech of hi
native land, are his finest works. Over the scor
of his last opera, *From the House of the Dead*, h
wrote the words "In every human being there is
divine spark" and it is this deep love of humanit
that permeates all his works. Of his operas *Kát*
Kabanová (1921) and *The Cunning Little Vixe*
(1924), the *Makropoulos Affair* (1926), and *Fro*
the House of the Dead (adapted from a Dostoyevsk
novel, 1928) are the most important and they hav
all been produced in Britain in recent years. Hi
original genius is self-evident in all of them.

Among his orchestral works *Taras Bulba* an
Sinfonietta should be noted, and his two strin
quartets, very difficult to play, should be bette
known. The song cycle, *Diary of one who ha*
disappeared, for tenor, contralto, and three femal
voices with piano, and the Glagolithic Mass contai
music of much expressive beauty.

Hungary.

The Hungarian musical outburst came some
what later than that in other countries. Its grea
figure is Bela Bartók (1881–1945) who, as well a
being a national figure, has proved an influentia
composer in the whole of 20th-cent. music. Hi

ind was full of folk music, but it was transmuted
r his strongly personal style and powerful in-
llect into something highly original. His music
tense and volatile but this restlessness is some-
nes relieved by a kind of other-wordly, ethereal
ricism, as in the lovely slow movements of his
artets.

Bartók was affected as much by the musical
novations of Debussy and Stravinsky (see below)
by East European, notably Magyar, folk music
d many of his works are an attempt to meld the
ro.

The most important part of his output is un-
ubtedly his string quartets which cover most of
s creative life. To this intimate form he con-
ied his personal innermost thoughts and in it
nducted his most far-reaching musical experi-
ents, thereby extending its boundaries beyond
ything previously known. As with Beethoven's
e quartets many of Bartok's rely on organic or
clic development while remaining just within
e laws of classical form. As Mosco Carner puts
"For profundity of thought, imaginative
wer, logic of structure, diversity of formal
tails, and enlargement of the technical scope,
ey stand unrivalled in the field of modern
amber music."

The most important of his orchestral works are
e three piano concertos, of which the first two
e harsh and uncompromising, and fiendishly
fficult to play, while the third, written in 1945,
mellower and more diatonic. The second violin
ncerto (1937–8) shows the various elements of
rtók's style in full flower, by turns exhuberant,
ssionate, and brilliant. The *Music for Strings,*
rcussion and Celesta (1937) is remarkable for its
range sonorities and its fascinating texture.
ne *Concerto for Orchestra* (1944) is more imme-
ately appealing and again shows the composer
complete command of a large canvas. Of the
ano works *Mikrokosmos* (1935) and the sonata
r two pianos and percussion (1937) are especially
be noted.

His chief stage pieces are *The Miraculous*
andarin (1919), a harsh, cruel ballet which drew
propriately dramatic music from the composer,
d the opera *Duke Bluebeard's Castle* (1911), a
scious, original score that makes one regret that
wrote no more operas later in his career.

Kodály (1882–1967) was from early years closely
sociated with Bartók and with him collected
ngarian folk melodies using many of them
his music. He worked in many forms and the
ore important of his works are the Peacock
riations for orchestra, the choral *Psalmus*
ngaricus and *Te Deum*, The *Dances of Galánta*,
d the opera *Háry János*, and the sonatas for
lo and for unaccompanied cello.

elius, Nielsen and Grieg.

Among Scandinavian composers the Finn Jean
elius (1865–1957) and the Dane Carl Nielsen
65–1931) are outstanding. Sibelius is a lone
rthern figure ploughing his own furrow,
ivious or, at any rate, ignoring the unusual
velopments that were taking place in Central
rope, yet his seven symphonies are strong as
nite, honest, rugged works that will un-
ubtedly stand the test of time. They are not
any means all similar in mood, or even form.
e first is very much influenced by Tchaikovsky
l Borodin, the second and third show a more
sonal style developing, the fourth is terse and
gic, the fifth lyrical, bright, and lucid; the sixth
erhaps most typically Sibelian in its evocation
primeval nature, and the seventh—in one
tinuous movement—is a more purely abstract
ce, notable for its structural logic and the grand-
s of its themes. The violin concerto is the
st easily understood of the composer's main
rks and has a grateful part for the soloist.

he tone poems *The Swan of Tuonela, Pohjola's*
ughter, En Saga, Night Ride and Sunrise, The
rd, and *Tapiola* uncannily evoke the icy words
he legends of the far north, and the primeval
forces of nature. Sibelius's one string quartet *Voces Intimae* and many of his songs are worth hearing too. The quality of this enigmatic composer's music has recently been the subject of much argument, but his musical personality is probably strong enough to survive the quirks of fashion.

Carl Nielsen (1865–1931) is another individualist. His six symphonies, like Sibelius's seven, are the most important part of his output, but whereas Sibelius was dealing with a huge, uninhabited northern landscape, Nielsen is more friendly and serene in his music, which is seldom forbidding, always inventive, throwing a new light, through unusual ideas about harmony, structure and tonality, on traditional forms. He also wrote highly individual concertos for the flute and clarinet, four string quartets and two operas—the dramatic, rather Brahmsian *Saul and David* (1902) and a delightful comedy, *Maskarade* (1906), full of lyrical music.

The Norwegian composer Edvard Grieg (1843–1907) was essentially a miniaturist whose range of feeling was not wide but whose music is always gentle and appealing. His most notable works are the romantic piano concerto, the atmospheric incidental music to Ibsen's play *Peer Gynt*, the charming Lyric Suite, and the small piano pieces. Not an important composer, then, but always an attractive one.

Elgar and the English Revival.

After the death of Purcell there is hardly a name in English music worth speaking of until the 19th cent. when Hubert Parry (1848–1918) and Charles Villiers Stanford (1852–1924), actually an Irishman, led a revival. Their music is seldom heard today, but their pioneer work paved the way for Edward Elgar (1857–1934). Although all were influenced by Brahms they nevertheless managed to establish a new English tradition that has been carried on in our own day. Elgar's symphonies are laid out on a grand, leisurely scale and they are both eloquent and exhilarating. His violin concerto has an elegiac slow movement as has the glorious cello concerto and both contain many fine opportunities for the soloist. The cello concerto is as appealing a work as any by Elgar expressing his innermost thoughts. His *Enigma* variations are a series of portraits in sound of his friends, but there is another overall theme to go with them that has never been identified. This has not prevented the work from becoming Elgar's most popular, not surprisingly when one considers its charm and melodiousness. Three other orchestral pieces that should not be neglected are his symphonic study *Falstaff*, a many-sided musical picture of the Fat Knight, and the overtures *Cockaigne*, a happy evocation of London, and *In the South*, inspired by a visit to Italy. His three late chamber works, written when he was 61, are reticent, economic pieces that remove any misconception of Elgar as a bombastic composer. His songs are mostly feeble, but the oratorios, notably *The Dream of Gerontius*, show the composer's ability to control a large canvas. The composer himself wrote over the score of *Gerontius*, "This is the best of me"—a verdict with which we can readily agree.

The French Impressionists.

César Franck (1822–90) was the main figure in mid-19th-cent. musical France and his influence spread even wider than his music of which only the D minor Symphony, the Symphonic Variations for piano and orchestra, the piano quintet, and the violin sonata are likely to be encountered today. The leading French opera composers of that time were Massenet (1842–1912) and Gounod (1818–93).

Concurrently with similar movements in French painting and poetry came the French Impressionist composers at the end of the 19th cent. Their leader—and one of the great seminal forces of modern music—was Claude Debussy (1862–1918). His aim was to capture a mood or sensation and he did that by more or less inventing a fresh system of harmony using a whole-tone scale, unusual chords, and creating in the orchestra new, highly personal textures—there is no mistaking the Debussy idiom once you have heard at least one piece by him. His impressionistic style did not lead him, however, to abandon form as some have suggested, and his main works are just as closely organised as those by classical German composers. His music is sensuous and poetic yet nearly always formally satisfying as well.

His reputation, at least with the general musical public, rests largely on his orchestral music, a few piano pieces and his only opera *Pelléas et Mélisande*. *La Mer* is a scintillating evocation of the sea in all its moods; *Nocturnes*, *Images*, and *Prélude à l'Aprés midi d'un Faune* exactly suggest different places, times, moods—the "Iberia" and "Gigues" sections of *Images*, calling to mind respectively the spirit of Spain and the flickering light of a rainy English night. *Pelléas*, based on a Symbolist drama by Maeterlinck, tells a story of love, jealousy, and murder in predominantly restrained yet emotionally loaded terms. It is an elusive original work that has no predecessor or successor. Intensely atmospheric, rivetingly beautiful, it weaves an irresistible spell over the listener.

Debussy's chamber music is unjustly neglected. His string quartet (1893) was one of the first works in which he displayed his new and strange world of sound, and the three late sonatas, one for violin, one for cello, and the third for flute, viola, and harp are elliptical, compressed pieces which seem to be questing disjointedly into new regions of sound. His songs too, are worthy of investigation, and his piano music, especially the twenty-four Preludes and some of the shorter pieces, contain some of his most imaginative and original ideas and thoughts.

Gabriel Fauré (1845–1924) is a difficult figure to place. He lived through all kinds of musical revolutions yet they seemed to affect the character of his work very little. He has never been, and is never likely to be, a widely known or popular composer, yet his music has a reticence and delicacy that is very appealing. Despite his dreamy, retiring art he was not a recluse, but a very sociable man.

He was content with forms as he found them, but he imbued them with a very personal, human style. Perhaps his art is best heard in his songs. They are not overtly passionate or dramatic but the long, sinuous melodies and subtle harmonies are exquisitely wrought. Of the song-cycles, *La Bonne Chanson*, *Cinq Mèlodies* (Verlaine), *Le Chanson d'Eve*, and *L'Horizon Chimérique* are best known. The last written in 1922, when the composer was seventy-seven, is a beautiful setting of words by a soldier killed in the first World War. There are also many remarkable single songs, many of them settings of poems by Verlaine.

He wrote few orchestral pieces, but the *Ballade* for piano and orchestra and the *Pavane* are among his most typical, and delicate compositions, and his outstanding piano music, modelled on Chopin's, includes Nocturnes, Impromptus, and Barcarolles. His chamber music covers more than half a century from the violin sonata of 1876 to the string quartet written the year he died. In that period he composed two piano quartets, two piano quintets, another violin sonata and two cello sonatas, the later works failing to show quite the unforced lyrical grace of the earlier ones. Perhaps Fauré is best approached with the first piano quartet, a charming, easily assimilated work, and the beautiful choral *Requiem*.

Saint-Saëns (1835–1921), an accomplished, cultivated musician, has had a "bad press" but his craftsmanship, as displayed in his symphonies, concertos, and *Samson et Dalila* (one among his 12 operas) is not to be despised.

Henri Duparc (1844–1933), despite a very long life, is known today only for a group of songs he wrote before he was forty. They are among the most emotionally direct yet tasteful melodies ever written. Paul Dukas (1865–1935) is another
figure off the beaten track, as it were. He, too
is known only for a handful of compositions. H
was strongly influenced by Vincent d'Ind
(1851–1931) and the school who strongly oppose
Debussy's new ideas, yet he could not help bu
come under Debussy's spell. Dukas's one grea
work is his opera *Ariane et Barbe-Bleue*, the tex
adapted from a Maeterlinck play written with th
composer in mind.

Maurice Ravel (1875–1937), a pupil of Faur
followed in Debussy's footsteps, although his late
pieces were more ascetic. Indeed, he was one
the most fastidious of composers, always seekin
and often finding, artistic perfection. The work
he wrote before 1918 are definitely of the Impre
sionist School and it would be difficult to imagin
more beautiful sounds than are to be found in th
ballet *Daphnis et Chloé*, in the song-cycle *Shéhér*
zade, and the piano fantasy *Gaspard de la Nui*
His first style was summed up in the A mino
piano trio (1915). In his later music Ravel wa
struggling, not always successfully, to keep u
with new developments such as jazz and atonality
The piano concerto, for instance, shows ver
strongly the influence of jazz.

Outstanding orchestral works of his, other tha
Daphnis are *Rapsodie espagnole* (1907), *La Val*
(1920), a sumptuous evocation of the Vienn
waltz, and the ever-popular *Boléro*. Two cham
ber works, besides the trio, are masterpieces—th
string quartet (1902–3) and the Introduction an
Allegro for Harp, String Quartet, Flute, an
Clarinet. This Septet composed in 1906, ravishe
the senses with magical sound.

Ravel's piano pieces are perhaps his mo
notable contribution to music, combining a
extraordinary feeling for the instrument's techn
cal possibilities with the sensibility of a Chopi
and in this field *Jeux d'eau*, *Miroirs*, and *M*
Mère l'Oye, all written just after the turn of th
century, come very close to the perfection
Gaspard de la Nuit. His songs show his unusu
appreciation of the need to fuse poetic and music
values, and he set exotic poems for preferenc
The song-cycle *Histoires naturelles* (1906) is a
acutely observed setting of five poems about bir
and animals; *Cinq Mélodies populaires Grecqu*
(1907) are charming settings of Greek folk song
Trois Poèmes de Mallarmé (1913), *Chanso*
Mendécasses (1926), are suitably exotic settin
of three poems by an 18th-cent. Creole poet calle
Parny. Finally in 1932 came *Don Quichotte*
Dulcinée, three poems by Paul Morand, Ravel
last composition.

Ravel wrote two operas—the slight but mode
ately amusing *L'Heure espagnole* (1907), nice
orchestrated in a faintly and appropriately Spa
ish style and *L'Enfant et les Sortilèges* (1925) to
story by Colette, a delicious fantasy about
naughty child who gets his due punishment f
tormenting animals and destroying furniture.

Spain.

Felipe Pedrell (1841–1922) has been apt
described as the midwife of Spanish national
music. As a musicologist and teacher he strong
influenced the two main composers of the scho
Manuel Falla (1876–1946) and Enrique Gran
dos (1867–1916). Falla's output was not lar
and most of it was written about the time of th
first World War. He had spent the years befo
the war in Paris and there he naturally came und
the influence of Debussy. Debussy wrote Spani
music without ever having been to Spain but
true was it that even to Falla, born and bred
Andalusia, it had new things to say. He was ab
to take something from Debussy and blend
with his own highly individual style, evoking
his music all the passion and gaiety of his nati
land. Perhaps his most typical works are t
two ballets *Love the Magician* (1915) full of Spani
atmosphere, and *The Three-Cornered Hat* (191
The opera *La Vida Breve* (1905), despite its wea
libretto, has much appeal, especially when t
leading rôle is sung by such a vibrant artist
Victoria de los Angeles. The Seven Popul
Spanish Songs (1914) conjure up the vivacity an

mouldering passion at the heart of the country's haracter, as does *Nights in the Garden of Spain* 1916), an evocative piece for piano and orchestra. His later works, especially the harpsichord con- erto of 1926, show Falla tending towards a less ebullient, more neo-classical style. His second pera *Master Peter's Puppet Show* (1923) is a niniaturist work, refined and intense. His third pera *Atlantida*, left unfinished at his death, was ompleted by his pupil Ernesto Halffter and first taged in 1962. It is a long work, more a dramatic antata than an opera, and as such a rather un- vieldy epic.

Granados, who was drowned when his ship was orpedoed by the Germans in 1916, was perhaps a nore restrictedly Spanish composer than Falla, out his music is unfailingly attractive, and surely others of his seven operas, besides *Goyescas* (which s heard occasionally), deserve to be rescued from oblivion. *Goyescas* itself is especially famous for he second interlude and opening of Act III—*La Maja y el Ruiseñor* (The lover and the nightingale), haunting, sinuous melody for soprano, some- imes heard in its original form as a piano solo. He wrote a set of *Tonadillas*. A tonadilla is a ype of Spanish song popular in the 18th cent., nd Granados's set ably and enchantingly recap- ures a lost age of grace and character. His xciting Spanish Dances are heard in both their iano and orchestral form.

The chief claim to fame of Albéniz (1860–1909) s *Ibéria*, masterly descriptive pieces for piano. urina (1882–1949), not altogether successfully, ttempted a more cosmopolitan style, but his nost often heard music, especially that for guitar, s typically Spanish.

he Late German Romantics.

While composers such as Debussy, Sibelius, travinsky, and Schoenberg (see below for the tter pair) were striking out along new paths, ichard Strauss (1864–1949) continued in the rend of 19th-cent. German composers; he was he tradition's last great figure. At least two of is operas—*Salome* and *Elektra*—were considered hocking at the time, but today we can hear that hey are essentially big-scale, romantic works—atural successors to Wagner's—however startling he harmonies may once have seemed.

If Strauss did not achieve the granite intellec- ual greatness of Beethoven or Wagner, there is o denying his melodic genius and powers of rtile invention which overlaid the streak of ulgarity and inflation in his musical make-up. is first outstanding achievement was in the field the symphonic-poem, where he carried the work composers such as Liszt and Berlioz to its gical conclusion. Starting with *Don Juan* in 888 and ending with *Sinfonia Domestica* in 1903 e wrote a series of kaleidoscopic works, full of normous vitality, endless melody, and fascinat- g orchestration. The most easily assimilated—nd the most popular—are *Don Juan* and *Till ulenspiegel* but some of the longer works, notably *lso Sprach Zarathustra* (based on Nietzsche's rose poem) and *Don Quixote* (based, of course, on ervantes's great work) will reward the persistent, quiring mind with long hours of enthralled stening. Other works sound somewhat dated their bombastic over-confidence, though rauss's skill in composition seldom flagged at is stage of his long creative career. The sym- honic poems all tell something of a story usually sed on a literary source, but it is not essential the enjoyment of the music to know what this although it may be helpful.

Strauss's reputation is even more solidly based his fifteen operas, the earliest of which *Guntram* as first performed in 1894, the last, *Capriccio*, in 42. During these years the essentials of rauss's style changed little, though it became ry much more refined as the years passed. His st operatic period ended with the violent, sen- ous tragedies *Salome* (1905) and *Elektra* (1909), e latter being his first collaboration with his ief librettist Hugo von Hofmannsthal. Then me their unique *Der Rosenkavalier* (1911), which filters the charm and the decadence of 18th-cent. Vienna through early 20th-cent. eyes. This was followed by *Ariadne auf Naxos* (1912). Originally intended to be given after Molière's *Le Bourgeois Gentilhomme*, it was later presented (1916) without the play but with a preceding scene, written by von Hofmannsthal. *Die Frau ohne Schatten* is the most grandiose result of the Strauss-Hofmannsthal partnership. It is a complex psychological allegory, but Strauss's contribution is not on as consistently lofty a level as is his librettist's. *Intermezzo* (1924), which has a libretto by Strauss himself, is a largely autobiographical domestic comedy, which has lately gained in reputation as a compact, charming piece. With *Die Aegyptische Helena* (1928), an opera on a mythical theme, and *Arabella* (1933), another charming Viennese comedy, the Strauss-Hofmannsthal collaboration ended on account of the librettist's death. Strauss then wrote *Die Schweigsame Frau* (1935) to a libretto by Stefan Zweig, based on a play by Ben Jonson, and *Friedenstag* (1938), *Daphne* (1938)—a beautiful opera—and *Die Liebe der Danae* (written 1938–40) with Josef Gregor as librettist. His swan-song was *Capriccio*, a dramatisation of the old argument about the relative importance of words and music in opera. The libretto is by the conductor Clemens Krauss and the opera, a serene, melodious work, was a fit end to a great operatic career.

However, Strauss went on composing till nearly the end of his life, adding a group of late orchestral pieces to his already large catalogue of works. The *Metamorphoses* for 23 solo string instruments, is probably the best of these. During his long creative career he wrote numerous songs, many of them, such as *Morgen*, *Wiegenlied* and *Ruhe, meine Seele* of surpassing beauty.

Other notable figures in German music at this time were Max Reger (1873–1916), a somewhat ponderous but highly accomplished composer who, in a quarter of a century of creative life, wrote more than 150 works, of which his sets of variations, his piano concerto, and chamber music are probably the most impressive. Hans Pfitzner (1869–1949), another German traditionalist, is chiefly remembered today for his opera *Palestrina*, about events, now known to be spurious, in the life of the 16th-cent. Italian composer.

Mahler.

Gustav Mahler (1860–1911), the Austrian Jewish composer, is one of the most important figures in 20th-cent. music. In a sense he bridges the gulf between the late Romantics, who were tending more and more towards chromaticism and away from established key relationships, and the atonalists, who abandoned key signatures entirely. His detractors maintain that his inflation of allegedly banal Viennese beer-house music to unheard-of lengths rules him out of court as a serious writer. His admirers would claim that his music encompasses the whole of life in enormous, valid structures. The truth, if truth there be, perhaps lies somewhere in between: that if his material does not always justify the length of his symphonies, if there are occasional imperfections and *longueurs*, these shortcomings are worth putting up with for the sake of the depth of utterance, the humanity and the poetry of the great pages. He admitted himself that "I cannot do without trivialities," but it is out of these impurities that he forged his titanic victories.

His music is undoubtedly best approached through his songs, where the words force him to discipline his wide-ranging vision. *Lieder eines fahrenden Gesellen* (1884), to his own words, *Kindertotenlieder* (1901–4), to poems by Rückert, and some individual songs perfectly relate words to music, and are all of a poignant loveliness. Similarly *Das Lied von der Erde* (1908), especially the last of the six songs, is a touching farewell to the world, nobly expressed.

The ten symphonies, however, are Mahler's most impressive legacy to posterity. They are almost impossible to characterise briefly so vast are they in terms of both length and variety. The first, fourth and ninth are probably the easiest to grasp but the fifth, sixth and seventh, despite flaws, contain some of his most awe-inspiring conceptions. The second and third, both of which use soloists and chorus, are revolutionary in layout and concept; they both try, inevitably without complete success, to carry out the composer's dictum, " a symphony should be like the world—it must contain everything." The eighth is even more gargantuan, but as in all Mahler's work size does not mean loss of clarity or an overloading of the structure. Part one—a mighty choral invocation—is a visionary setting of the mediaeval hymn *Veni Creator Spiritus.* Part two, which incorporates adagio, scherzo, and finale in one, is a setting of the final scene of Goethe's *Faust.* Until recently all of Mahler's unfinished tenth symphony that was ever performed was the Adagio, but the musicologist and Mahler scholar, Deryck Cooke, has recently completed the symphony to critical and popular acclaim and thus added a noble, and also optimistic epilogue to the Mahler opus. The debate over the quality of Mahler's music is likely to continue: one fact, however, that cannot be gain-said is his popularity with an ever-increasing audience, many of them young people. There must be something in his uncertainty and intense self-inquiry that accords with the mood of today.

Schoenberg and the Second Viennese School.

Arnold Schoenberg (1874–1951) revolutionised Western music by his twelve-note theory—a system which uses all the notes of the chromatic scale " and denies the supremacy of a tonal centre," as Schoenberg himself puts it. This serial technique of composition, as it is commonly called, naturally sounds strange to an ear acclimatised to music written, as it were, with a home base, but Schoenberg and his disciples Berg and Webern showed that the system could produce works that were something more than mere intellectual exercises. None of the more recent advances in music would have been possible, even thinkable, without Schoenberg's pioneer work.

Schoenberg always regarded himself as much as a composer as a theorist or teacher, and his works are supposed to appeal as much to the emotions as to the intellect, although to be understood they do, of course, require the listener's concentrated attention. To appreciate how his ideas developed it is necessary to hear first his pre-atonal music, such as the *Gurrelieder* (1900–1) and *Verklärte Nacht* (1899), in which he carried Wagnerian chromaticism to extreme lengths. The *Gurrelieder*, in particular, is a luxuriant, overblown work that shows the Wagnerian idiom in an advanced stage of decay, in spite of many beautiful pages of music. In his succeeding works the feeling of tonality began to disappear until in the Three Piano Pieces (opus 11), of 1909, he finally rejected tonality, although the new 12-note scheme is not yet evident; traces of the old order can still be heard. The succeeding works were mostly short, highly compressed, and very expressive. Schoenberg was reaching out for a new system, which would " justify the dissonant character of these harmonies and determine their successions." By 1923 he had formulated his 12-note system and the Five Piano Pieces (opus 23), and the Serenade (opus 24) of that year, can thus be considered the first works that used a note-row as the fundamental basis of their composition. Between 1910 and 1915, however, the Russian composer Alexander Scriabin (1872–1915) had attempted to define a new method of composition of his own employing the " mystic chord " of ascending fourths, but his scheme proved comparatively abortive when compared with Schoenberg's. Josef Hauer (1883–1959) also developed a 12-note system which he propounded in 1919 and he always considered himself, rather than Schoenberg, as the true founder of the system. He later worked out a system of tropes (*i.e.*, half-series of six notes).

To return to Schoenberg, in later works he shows much more freedom and assurance in the use of his system. The wind quintet (1924), the variations for orchestra, opus 31 (1927–8), the third (1926), and fourth (1936) string quartets, and the string trio (1946) are modern classics of their kind: they require concentrated listening and a degree of understanding of the unfamiliar style of composition. The set of songs with piano *Das Buch der hängenden Gärten* (opus 15), written in 1908, *Pierrot Lunaire*, opus 21 (1912) and the Four Songs, opus 22 (1913–14) provide a kind of bridge between tonality and atonality that the adventurous mind should cross. The monodrama *Erwartung* (1909) is another fascinating work, but perhaps the unfinished *Moses and Aaron* (1932) is Schoenberg's masterpiece as its production at Covent Garden in 1965 showed. Here, for certain, the composer matched his obvious intellectual capacities with an evident emotional content and managed to combine *Sprechgesang* (speech-song) and singing with a real degree of success.

It is only in recent years that Schoenberg's music has had a real chance to make its mark through the essential prerequisite of frequent performance. If his idiom now seems approachable, and a reasonably natural outcome of late 19th-cent. developments, it is perhaps because other, more recent composers have extended the boundaries of sound much further.

Schoenberg's two most respected disciples were Anton Webern (1883–1945) and Alban Berg (1885–1935). Webern's output is small, reaching only to opus 31, and many of his works are very brief. They are exquisitely precise, and delicate almost to a fault. He was trying to distil the essence of each note and in so doing carried the 12-note system to its most extreme and cerebral limit. His music has often been described as pointillist in the sense that one note is entirely separated from the next, there being little discernible melody. Beyond Webern's music, there is indeed the sound of nothingness, and he was rightly described during his lifetime as the " composer of the *pianissimo espressivo*". In his later works, Webern tended towards a strict, and often ingenious use of form and the Variations for Orchestra of 1940 are a good example of this and of his delicacy of orchestration. Webern's influence has perhaps been greater than the impact of his own music, even though he has had no direct successor.

Berg's music is much more accessible. Like Webern his total output was not large but nearly all his works are substantial additions to the repertory. He is also the directest link between Mahler and the second Viennese School, as Mahler's music influenced him strongly. He studied with Schoenberg from 1904 to 1910. His music is more intense, more lyrical, and less attenuated in sound than Schoenberg's or Webern's. His humanity and abiding compassion can be heard most strongly in his finest opera *Wozzeck* (1925) and his violin concerto (1935), written as an elegy on the death of Manon Gropius, a beautiful 18-year-old girl. Both works are very carefully designed yet formal considerations are never allowed to submerge feeling, and the note-row is fully integrated into the structure.

Both *Wozzeck* and the unfinished but rewarding *Lulu* are concerned with society's outcasts who are treated with great tenderness in both operas. The later work is entirely dodecaphonic, all the opera's episodes being based on a theme associated with Lulu. Between these operas Berg wrote the highly complex Chamber Concerto for piano, violin, and thirteen wind instruments (1925) and the expressive Lyric Suite (1926). Among his early works the Seven Early Songs (1908–9) and the concert aria *Der Wein* (1929) are notable.

Stravinsky.

Igor Stravinsky (b. 1882) is another vital figure in 20th-cent. music. If his influence has been in quite another and perhaps less drastic direction than Schoenberg's it is hardly less important. Indeed, future musical historians may consider his achievement the more significant. He has been compared with the painter Picasso in his almost hectic desire to keep up with the times, yet, although he has written in a number of very different styles during the past fifty years, every work of his is stamped with his own definitive nusical personality. His most revolutionary nd seminal work is undoubtedly *The Rite of pring* (written for the ballet impresario Diaghi- ev), which caused a furore when it first ap- eared in 1913, and although it no longer shocks, ne rhythmical energy, the fierce angular thematic naterial, and the sheer virtuosity of the orchestra- ion will always have the power to excite new udiences. Before *The Rite* Stravinsky had ritten two ballets for Diaghilev—*The Firebird* nd *Petrushka*—that are no less filled with vitality nd new, albeit not so violent, sounds. During ne next thirty years Stravinsky wrote a series of allet works, gradually becoming more austere and efined in composition. *Apollo* (1928) and *Orpheus* 947) belong among his most attractive scores.

Stravinsky has not confined himself in stage orks to the ballet. *The Nightingale* (1914) is a narming, early opera; *The Soldiers Tale* (1918) is witty combination of narration, mime, and ance; *Les Noces* (1923) is a concise, original horeographic cantata for soloists and chorus; *edipus Rex* (1927) is a dignified version of the ophocles play, which can be staged or given on ne concert platform; either way it is a moving xperience. *Perséphone* (1934), a melodrama for eciter, tenor, chorus, and orchestra is an appeal- g, lucid score. Since the war his most important age work by far has been *The Rake's Progress* 951), with a libretto by W. H. Auden and Chester allman. This fascinating opera is deliberately ased on 18th-cent. forms and the music itself is eo-classical, always attractive, sometimes haunt- g.

Stravinsky has been no laggard in writing for ne concert-platform either. The finest of these orks are probably the fervent impressive choral *ymphony of Psalms* (1930), the Violin Concerto 931) and the aggressive compact Symphony in ree movements (1945). Of his chamber music ne Octet (1923), a Duo Concertant (1932), and eptet (1952) are probably the most important, ut no piece, even the dryest and most pedantic, without redeeming features.

Stravinsky is often thought of as an aloof, de- ched figure. He has been castigated for his ck of lyrical warmth. But in spite of his own rofessed desire to drain his music of specific notion, craftsmanship and originality, often ith a strange other-worldly beauty added, are nmistakeably there throughout his many scores. uirky and annoying he may be, dull never.

usoni and Puccini.

Italian music in the early part of the century as dominated by two very different composers— erruccio Busoni (1866–1924) and Giacomo uccini (1858–1924). Busoni is a difficult figure place. His austere, intellectual power is never lled in question, but he seldom, if ever, succeeded translating his technical prowess into altogether ccessful compositions. We can admire the rength, honesty, and often beauty of such works his huge piano concerto (1903–4), *Fantasia ntrappuntisca* (1912)—for piano solo—and his nfinished opera *Doktor Faust* without ever capitu- ing to them entirely. None the less, it has to admitted that those who have studied his usic closely have always fallen completely under s spell. In style his music is anti-Romantic and ten neo-Classical yet he was an ardent admirer Liszt and more especially of Liszt's realisation the possibilities of the pianoforte. Busoni, mself a great pianist, carried on where Liszt had t off in his own piano music, in which form and pression often find their perfect balance. *ktor Faust* is undoubtedly his most important era but *Die Brautwahl* (1908–10) and *Turandot* 917) have many points of interest too.

Puccini's *Turandot*—his last opera—is a much ander version of the same Gozzi fable and the mination of this great opera composer's work. s achievement is at an almost directly opposite le to Busoni's. Not for him the severity or ellectuality of his contemporary. He sought l found an almost ideal fusion of straight-for- rd lyricism and dramatic truth. His music unerringly follows the pathos and passion of the stories he sets and all his characters "live" as human beings. That, and his abundant flow of easy, soaring melody, are the reasons for his immense popular success, unequalled by any other 20th-cent. composer. Whether it is the pathetic Mimi (*La Bohème*—1896) and Cio-Cio-San, (*Madama Butterfly*—1904), the evil Scarpia, (*Tosca*—1900), the cunning Schicchi (*Gianni Schicchi*—1918), the ardent Rudolfo (*La Bohème*) and Cavaradossi (*Tosca*), or the ice-cold Turandot (*Turandot*—1926), Puccini's musical characterisation is unfailing. And he backs his *verismo* vocal writing with an orchestral tissue that faithfully reflects the milieu of each opera, for instance, Japanese for *Butterfly*, Chinese for *Turandot*, while never losing his particular brand of Italian warmth. His orchestration is always subtle and luminous.

Other Italian composers who wrote operas in the *verismo* style of Puccini were Leoncavallo (1858–1919), Mascagni (1863–1945), and Giordano (1867–1948).

Prokofiev, Shostakovich, and Rachmaninov.

Sergey Prokofiev (1891–1953) spent part of his creative life in his native Russia, part of it (1918–34) abroad, mostly in Paris. His early music, apart from the popular Classical Symphony (1916–17) tended to be acid and harsh, but on his return to Russia his style, though still frequently satirical, became warmer, more Romantic. The third piano concerto (1917) and the second symphony (1924) are good examples of the former period, the ballets *Romeo and Juliet* (1935) and *Cinderella* (1941–44) and the fifth (1944) and sixth (1949) symphonies of the latter. His music gives the impression of immense rhythmical energy, as in the outer movements of several of his nine piano sonatas, but this fierce drive is often leavened by the soft, wistful lights of his slow movements. His second string quartet (1941), perhaps, presents all the elements of his music in the kindest light.

His strong leaning towards fantasy and mordaunt parody is felt in his earlier operas *The Love of the Three Oranges* (1921) and *The Fiery Angel* (1922–25). *War and Peace* (1941–42) was written in the face of strong pressure from the Soviet authorities.

Dmitri Shostakovich (b. 1906) has also suffered from attacks of "formalism". He had to conform to Stalin's requirements for writing music, but he has survived and continues to produce music of universal appeal, as, for example, his most recent string quartets. Like Prokofiev, his music falls into two very distinct styles: one humorous and spiky, the other intense, very personal and often large-scale in its implications. Not all his twelve symphonies reach the expressive depths of numbers one, five, six, and eight, but they all have rewarding passages and his recent violin and cello concertos are of high quality. He has so far written eleven string quartets, a piano quintet (an attractive piece) and two operas: the satirical *The Nose* (1930) and *Katerina Ismailova* (1934, revised 1959), originally known as "Lady Macbeth of Mstensk." It is much too early to "place" Shostakovich in musical history, but his original genius cannot be doubted.

Although Sergey Rachmaninov (1873–1943) was born in Russia, he left his home country in 1918, disliking the Soviet régime, and lived mostly in Switzerland and the United States. His music is chiefly notable for its Romanticism, nostalgic melody, nervous energy and, in the piano works, its opportunities for displays of virtuosity. The first three piano concertos, the third symphony, the piano preludes, and the Rhapsody on a theme of Paganini, are his most typical and attractive works, and many of his songs are touching and beautiful. He wrote three operas.

Modern French Music.

French music after Debussy and Ravel was dominated by the slighter composers known as *Les Six*, the most important of whom were Arthur

Honegger (1892–1955, Swiss born), Darius Milhaud (b. 1892) and Francis Poulenc (1899–1963). Each has contributed music of some wit and charm to the repertory. They were influenced by Erik Satie (1866–1925), an eccentric but interesting figure, who wrote works with odd titles such as *Three Pear-Shaped Pieces*. His music is entirely unsentimental, often ironic.

Much more revolutionary has been the work of Olivier Messiaen (b. 1908), who has turned to Indian music and, above all, to bird-song for inspiration. He first came to notice as a composer of organ music. Then his *Quatuor pour la fin de temps*, written in captivity between 1940 and 1942, his long piano pieces, based on bird-song (often literally) and his gigantic *Turangalila* symphony show him experimenting with complex rhythms, strange sonorities (using unusual instruments such as the Ondes Martenot in the symphony), and considerably widening music's horizons. Edgar Varèse (1885–1965) cultivated an even broader spectrum of sound, employing electronic instruments to complement and contrast with traditional ones. Pierre Boulez (b. 1925), a pupil of Messiaen, bases his extremely complex works on mathematical relationships. His music, other than that for the piano, mostly calls for a variety of percussion instruments often combined with the soprano voice in evocations of of French poetry (Mallarmé in particular). The resulting timbre and sonorities are intriguing even when the intellectual basis of the music is but dimly perceived.

Modern German Music.

Kurt Weill (1900–50) is chiefly known for his socio-politically pointed operas, such as *Die Dreigroschenoper* (1929), *Mahagonny* (1929), *Der Jasager* (1930), and *Happy End* (1929), all effective works on the stage, and for his particular brand of brittle, yet fundamentally romantic music. His influence on later composers has been considerable.

Carl Orff (b. 1895) has written chiefly for the stage. His music is rhythmically insistent, avoids counterpoint, and is deliberately, even self-consciously straightforward. Most frequently heard is his *Carmina Burana*, lively, rumbustious choral settings of mediæval poems.

Paul Hindemith (1895–1964) in his later years wrote in a strictly tonal, often neo-classical idiom, after being one of the most advanced intellectuals of his time. As well as many chamber and orchestral works, he wrote three formidable operas: *Die Harmonie der Welt*, *Cardillac* and *Mathis der Maler*.

Karlheinz Stockhausen (b. 1928), a pupil of Messiaen, is another extreme innovator. He more than anyone puts electronics to musical use. His scores are a maze of diagrams and instructions, which really need the composer's presence for their true interpretation. It is too early to say whether his music is evidence of a passing vogue or a real step forward in musical ideas.

Hans Werner Henze (b. 1926) has rebelled against the musical climate in Germany, and now lives in Italy, yet his music combines the intellectuality of the modern German schools with the lyricism of Italian music. He has written five symphonies, though none follow the traditional form, and nine operas, among them two impressive large-scale works, *Kōnig Hirsch* (1952–55) and *The Bassarids* (1966), to an Auden-Kallman libretto.

American Music.

It was not until the 20th cent. that American music really got under way and an American school came into being. With the possible exception of MacDowell (1861–1908) no earlier composers are remembered or played today. Many composers of the American school have, of course, taken their cue from Europe but the influence of American jazz and folk-song is also recognisable in some of their music. Aaron Copland (b. 1900) is probably the most important figure on the current scene, and such works as *Appalachian Spring*, *Billy the Kid*, and his third symphony have gained a certain amount of international recognition and popularity. Samuel Barber (b. 1910) works along traditional lines and his music, like Copland's, is essentially diatonic. He has contributed to all the usual forms (symphony, concerto, sonata), most recently to opera with *Vanessa* (1958) and *Antony and Cleopatra* (1966), which opened the new Metropolitan Opera House in New York's Lincoln Centre. Roy Harris (b. 1898) has written seven symphonies and several concertos, which include folk elements.

Charles Ives (1874–1954) has recently been recognised as the most original American composer. While carrying on a highly successful career in insurance, Ives yet managed to anticipate in his works, all written before 1920, many of the innovations which were later "invented" in Europe. His orchestral music is much influenced by the sounds, such as brass bands, which he heard in his native New England as a boy. His *Three Places in New England* and *The Unanswered Question* have a beautiful, elusive quality about them. In his five symphonies and *Concord* sonata we notice the working of an original mind employing polytonality and polyrhythms in larger and more complex works. An element of improvisation is sometimes introduced, another anticipation of latter-day technique. Ives is unlikely ever to become a popular composer—his music is too complicated and eclectic for that—but his importance as a prophet is surely established.

Modern English School.

The amazing 20th cent. revival of music in England owes much to Ralph Vaughan Williams (1872–1958) and Gustav Holst (1874–1934). Vaughan Williams's music is today suffering a decline in reputation, but the best of his symphonies (one, four, five, and six), his Fantasia on a theme by Tallis, his ballet *Job*, and the best of his choral music have a sturdiness about them that will no doubt weather the whim of passing fashion. His music alternates between the forceful and the contemplative and both moods are expressed in a distinctive musical vocabulary, based on modalism and 16th-cent. polyphony.

Holst was a more enigmatic figure, but his influence has undoubtedly been greater. Only his suite *The Planets* and the choral *The Hymn of Jesus* have established themselves as repertory works, but his bold harmonic experiments and the austerity, even mysticism, of his style as heard in the orchestral pieces *Egdon Heath*, *Beni Mora*, and the opera *Savitri* are perhaps more typical of this contemplative original composer. His daughter Imogen, a conductor, has done much to promote understanding of her father's music. Contemporaries who deserve a bare mention are John Ireland (1879–1962) and Sir Arnold Bax (1883–1953).

Frederick Delius (1862–1934) was the only important English disciple of the French impressionist school. He lived in France from 1884 onwards. His most important works are the atmospheric orchestral scores, such as *Brigg Fair* and the vocal works *Sea Drift* and *A Mass of Life*.

Of the more recent generation of English composers the most important are undoubtedly Benjamin Britten (b. 1913) Sir Michael Tippett (b. 1905), Alan Rawsthorne (b. 1905), and Sir William Walton (b. 1902). Britten has done more than anyone to establish English music on the forefront of the international stage. Much of his music seems to have an immediate appeal to large audiences and certainly his many stage works have earned him a quite exceptional prestige both at home and abroad. *Peter Grimes* (1945), *Billy Budd* (1951), *Gloriana* (1953), *A Midsummer Night's Dream* (1960) all, in their very different ways, show his consummate mastery of stage technique and the first two are also moving human documents. On a smaller scale he has achieved as much with his chamber operas—*The Rape of Lucretia* (1946), *Albert Herring* (1947) l *The Turn of the Screw* (1954, based on a nry James novel)—and with the two recent rables for Church Performance—*Curlew River* 64) and *The Burning Fiery Furnace* (1960). he had written nothing else, those dramatic rks would have marked him out as a composer outstanding imaginative gifts.

But there is more—the choral works culminat- in the *War Requiem* (1962), his various song cles written for the tenor Peter Pears, the enade for tenor, horn, and string, *Nocturne* tenor and orchestra, the three Canticles, and Spring Symphony are further evidence—in y different media—of both his intense emotional nmitment and his technical skill. While being ongly influenced by such composers as Schubert, rdi, Mahler, and Berg, his style is entirely his n: it is a musical personality that manages to nbine, as it has been said, "a deep nostalgia for innocence of childhood, a mercurial sense of nour and a passionate sympathy with the tims of prejudice and misunderstanding."

This last quality is particularly evident also in ppett's emotional makeup as expressed in his sic, especially in one of his earliest successes, choral work *A Child of Our Time* (1941), which ws both his compassion and his ability to write a large scale. But Tippett is as much a mystic l searcher as a composer and he is constantly king new and different ways of widening his eners' horizons, as may be heard in the ex- dingly complex *Vision of St. Augustine* (1965), ich tellingly sets to music the striving to under- nd the "beyond" of Augustine's words.

Tippett has also sought new means of musical ression as he has shown in his second opera *ng Priam* (1962), very spare and pointed in om, and in the concerto for orchestra (1962). ese works, as well as his piano concerto (1956) l second symphony—a luminous work—and his ee string quartets, are very difficult to perform nd to get to know—but the effort to understand composer's wide-spanning mind is always ly rewarded. However, perhaps a newcomer his music does better to approach him through more straightforward earlier works, the certo for double string orchestra (1939), the tasia Concertante on a theme of Corelli (1953) lyrically poetic piece—or the song cycles *yhood's End* (1943) and *Heart's Assurance* 57). The quality of his allegorical opera *The dsummer Marriage* (1952), in spite of its in- ved libretto (by the composer), may be better reciated when it is revived at Covent Garden 968. Tippett is an uncompromising in- dualist, writing without fear or favour, haps considerably in advance of his time in ught and achievement.

Rawsthorne's style is admirably direct and est. Eschewing the latest fashions in music has ploughed his own furrow of deeply felt writing. His ideas are argued out with considerable lyrical force, and his astute regard for form does not hide the underlying emotional content of his music nor the touch of wit that pervades some of his more lively movements. Among his most important accomplishments to date are his three string quartets, violin concerto, two piano concertos, and the quintet for piano and wind instruments.

Walton's outstanding contribution was made before the second World War in music that was alternately gay and romantic. The irreverent *Façade* (1922) for speaker and chamber orchestra falls into the former category, the poetic viola concerto (1930) into the second. His first symphony (1934) is an arresting, dramatic score, and the oratorio *Belshazzar's Feast* (1929–31) is a landmark in choral music. Since the war his works have never quite recaptured the same urgency of expression.

Elisabeth Lutyens (b. 1906) is Britain's leading twelve-note composer. For long shunned by the musical establishment, she has now been accepted as an important and seminal figure in the history of 20th-cent. music. Her output has been large and includes numerous works for unusual, small groups of instruments, often combined with a solo voice. Benjamin Frankel (b. 1906), Edmund Rubbra (b. 1901), Sir Arthur Bliss (b. 1891), and Lennox Berkeley (b. 1903) are other composers of note among the senior school of living British composers. Egon Wellesz (b. 1885), Austrian born, settled in this country in 1939. He has written operas, choral works, symphonies, and chamber music, and is still active. There is a thriving junior school of British composers who have already made their mark, among them Alexander Goehr, Richard Rodney Bennett, Malcolm Williamson, and Nicholas Maw, each of whom has written one or more operas.

Where Does the Future Lie?

It is anybody's guess which way music will develop during the next few decades. Are older forms quite outmoded, as some recent innovators suggest, and does the future therefore lie with the electronic music and/or percussive sounds—of Boulez, Stockhausen, Luigi Nono (b. 1924), and their disciples? Or will what has been recognised as musical sound for several generations adapt itself to the new mood abroad? Has atonalism still something to offer or was it a passing phase, already dated and out of fashion? Perhaps the only answer that can be given with certainty is that, as with other centuries, a dozen or so composers' music will survive to delight later generations and that these geniuses will be found among composers who do and say what they must in music without regard to fashion, patronage, or fear of what anyone writes about them. May they be worthy of their rich heritage.

II. GLOSSARY OF MUSICAL TERMS

Note of scale, commonly used for tuning struments.

olute Music. Music without any literary escriptive or other kind of reference.

Capella. Literally "in the church style." naccompanied.

elerando. Quickening of the pace.

idental. The sign which alters a note by a emitone, *i.e.*, ♯ (sharp) raises it; ♭ (flat) lowers ; ♮ restores a note to its original position.

ompaniment. Instrumental or piano part rming background to a solo voice or instru- ent that has the melody.

lib. (L. *ad libitum*). Direction on music that rict time need not be observed.

gio. A slow movement or piece.

lian mode. One of the scales in mediæval usic, represented by the white keys of the ano from A to A.

Air. A simple tune for voice or instrument.

Alberti bass. Rhythmical accompanying figure made up by splitting a chord. Used extensively in 18th-cent. music and associated with the Italian composer Alberti.

Allegretto. Not quite so fast as *Allegro.*

Allegro. Fast, but not too fast.

Alto. An unusually high type of male voice; also the vocal part sung by women and boys with a low range.

Ambrosian Chant. Plainsong introduced into church music by St. Ambrose, bishop of Milan (d. 397), and differing from Gregorian chant.

Andante. At a walking pace, not so slow as *Adagio* nor as fast as *Allegretto.*

Animato. Lively.

Answer. Second entry in a fugue, usually in the dominant.

Anthem. Composition for use in church during a service by a choir with or without soloists.

Antiphonal. Using groups of instruments or singers placed apart.

Appoggiatura. An ornament consisting of a short note just above or below a note forming part of a chord.

Arabesque. Usually a short piece, highly decorated.

Arco. Direction for string instruments to play with bow.

Aria. Vocal solo, usually in opera or oratorio, often in three sections with the third part being a repeat of the first. An *Arietta* is a shorter, lighter kind of aria.

Arioso. In the style of an aria; halfway between aria and recitative.

Arpeggio. Notes of a chord played in a broken, spread-out manner, as on a harp.

Ars antiqua. The old mediæval music, based on organum and plainsong, before the introduction of *Ars nova* in 14th cent.

Ars nova. Musical style current from 14th cent., more independent than the old style in the part-writing and harmony.

Atonal. Not in any key; hence *Atonality.*

Aubade. Morning song.

Augmentation. The enlargement of a melody by lengthening the musical values of its notes.

Ayre. Old spelling of *air.*

B. Note of scale, represented in Germany by *H.*

Bagatelle. A short, generally light piece of music. Beethoven wrote 26 Bagatelles.

Ballad. Either a narrative song or an 18th-cent. drawing-room song.

Ballade. Instrumental piece in story-telling manner. Chopin wrote 4.

Ballet. Stage entertainment requiring instrumental accompaniment; originated at French court in 16th and 17th cent.

Bar. A metrical division of music; the perpendicular line in musical notation to indicate this.

Barcarolle. A boating-song, in particular one associated with Venetian gondoliers.

Baritone. A male voice, between tenor and bass.

Baroque. A term applied, loosely, to music written in the 17th and 18th cent., roughly corresponding to baroque in architecture.

Bass. The lowest male voice; lowest part of a composition.

Bass Drum. Largest of the drum family, placed upright and struck on the side.

Bassoon. The lowest of the woodwind instruments, uses double reed.

Beat. Music's rhythmic pulse.

Bel canto. Literally "beautiful singing"—in the old Italian style with pure tone and exact phrasing.

Berceuse. Cradle song.

Binary. A piece in two sections is said to be binary in form. The balance is obtained by a second phrase (or section) answering the first.

Bitonality. Use of two keys at once.

Bow. Stick with horsehair stretched across it for playing string instruments.

Brass. Used as a collective noun for all brass or metal instruments.

Breve. Note, rarely used nowadays, with tone value of two semibreves.

Bridge. Wood support over which strings are stretched on a violin, cello, guitar, etc.

Buffo(a). Comic, as in *buffo bass* or *opera buffa.*

C. Note of scale.

Cabaletta. Final, quick section of an aria or duet.

Cadence. A closing phrase of a composition or a passage, coming to rest on tonic (key note).

Cadenza. Solo vocal or instrumental passage either written or improvised, giving solois chance to display technical skill to audience.

Calando. Becoming quieter and slower.

Canon. Device in contrapuntal compositio whereby a melody is introduced by one voice o instrument then repeated by one or more voice or instruments, either at the same pitch (cano at the unison) or at different intervals (canon a the fifth, for example).

Cantabile. Song-like, therefore flowing an expressive.

Cantata. Vocal work for chorus and/or choir.

Cantilena. Sustained, smooth melodic line.

Cantus firmus. Literally "fixed song." Bas melody from 14th to 17th cent., around whic other voices wove contrapuntal parts.

Canzonet. Light songs written in England *c.* 1600

Carillon. A set of bells in tower of church, playe from a keyboard below.

Carol. Christmas song.

Castrato. Artificially-created male soprano an alto, fashionable in 17th and 18th cent. (Th castration of vocally gifted boys prevailed i Italy until the 19th cent.)

Catch. A part-song like a round, in vogue i England from 16th to 19th cent.

Cavatina. An operatic song in one section, or slow song-like instrumental movement.

Celesta. Keyboard instrument with metal bar struck by hammers.

Cello. Four-stringed instrument, played wit bow, with a bass range. Comes between viol and double bass in string family.

Cembalo. Originally the Italian name for th dulcimer, but sometimes applied to the harpsichord.

Chaconne. Vocal or instrumental piece wit unvaried bass.

Chamber Music. Music originally intended to b played in a room for three or more players.

Chanson. Type of part-song current in Franc from 14th to 16th cent.

Chant. Singing of psalms, masses, etc., in plain song to Latin words in church.

Choir. Body of singers, used either in church o at concerts.

Chorales. German hymn tunes, often made us of by Bach.

Chord. Sounding together of several notes, always more than three.

Chording. Spacing of intervals in a chord.

Chorus. Substantial body of singers, usuall singing in four parts.

Chromatic. Using a scale of nothing but semitones.

Clarinet. Woodwind instrument with single ree in use since mid-18th cent.

Clavichord. Keyboard instrument having string struck by metal tangents, much in use durin 17th and 18th cent. as solo instrument.

Clavier. Used in German (*Klavier*) for piano, i England for any stringed keyboard instrument

Clef. Sign in stave that fixes place of each note

Coda. Closing section of movement in Sonat form.

Coloratura. Term to denote florid singing.

Common chord. *See* Triad.

Common Time. Four crotchets to the bar, 4/ time.

Compass. Range of notes covered by voice o instruments.

Composition. Piece of music, originated by composer's own imagination; act of writin such a piece.

Compound time. Any musical metric not in simp time.

Con Brio. With dash.

Concert. Public performance of any music.

certato. Writing for several solo instruments b be played together.

certo. Work for one or more solo instruments nd orchestra.

certo grosso. Orchestral work common in 17th nd 18th cent. with prominent parts for small roups of instruments.

cord. Opposite of discord, *i.e.*, notes that hen sounded together satisfy the ear. (Conentional term in that its application varies ccording to the age in which one lives.)

duct. To direct a concert with a baton.

secutive. Progression of harmonic intervals of ke kind.

sonance. Like Concord.

tinuo. Bass line, used in 17th- and 18th-cent. usic, for a keyboard instrument, requiring pecial skill from performer.

tralto. A woman's voice with a low range.

nterpoint. Simultaneous combination of two r more melodies to create a satisfying musical exture. Where one melody is added to nother, one is called the other's counterpoint. he adjective of counterpoint is contrapuntal.

nter-tenor. Another name for male alto.

rante. A dance in triple time.

scendo. Getting louder.

ok. Detachable section of tubing on brass struments that change the tuning.

chet. Note that equals two quavers in time alue.

le. Set of works, especially songs, intended to e sung as group.

lic form. Form of work in two or more moveents in which the same musical themes recur.

bal. Percussion instrument; two plates ruck against each other.

Note of scale.

Capo (abbr. D.C.). A *Da Capo* aria is one in hich the whole first section is repeated after a ontrasting middle section.

cant. Additional part (sometimes improvised) ung against a melody.

elopment. Working-out section of movement sonata form. *See* Sonata.

tonic. Opposite of chromatic; using proper otes of a major or minor scale.

inished. Lessened version of perfect interval, g., semitone less than a perfect fifth is a minished fifth.

inuendo. Lessening.

inution. Reducing a phrase of melody by hortening time value of notes.

cord. Opposite of concord, *i.e.*, notes that unded together produce a clash of harmonies.

sonance. Like discord.

rtimento. A piece, usually orchestral, in veral movements; like a suite.

ecaphonic. Pertaining to 12-note method of mposition.

inant. Fifth note of major or minor scale bove tonic (key) note.

ian Mode. One of the scales in mediæval usic, represented by the white keys on the iano from D to D.

Placed over note indicates staccato; placed ter note indicates time value to be increased half.

ble bar. Two upright lines marking the end a composition or a section of it.

ble bass. Largest and lowest instrument of olin family; played with bow.

ne bass. Unvarying sustained bass, similar to e permanent bass note of a bagpipe.

n. Variety of percussion instruments on hich sound is produced by hitting a skin retched tightly over a hollow cylinder or misphere.

Duet. Combination of two performers; composition for such a combination.

Duple time. Time in which main division is two or four.

Dynamics. Gradations of loudness or softness in music.

E. Note of scale.

Electronic. Term used to describe use of electronic sounds in music.

Encore. Request from audience for repeat of work, or extra item in a programme.

English horn (*Cor anglais*). Woodwind instrument with double reed of oboe family.

Enharmonic. Modulation made by means of change of note between sharps and flats, although note remains the same (E flat becomes D sharp, for example).

Ensemble. Teamwork in performance; item in opera for several singers with or without chorus; a group of performers of no fixed number.

Episode. Section in composition usually divorced from main argument.

Exposition. Setting out of thematic material in a sonata-form composition.

Expression marks. Indication by composer of how he wants his music performed.

F. Note of scale.

False relation. A clash of harmony produced when two notes, such as A natural and A flat, are played simultaneously or immediately following one another.

Falsetto. The kind of singing by male voices above normal register and sounding like an unbroken voice.

Fanfare. Flourish of trumpets.

Fantasy. A piece suggesting free play of composer's imagination, or a piece based on known tunes (folk, operatic, etc.).

Fermata. Pause indicated by sign 𝄐 prolonging note beyond its normal length.

Fifth. Interval taking five steps in the scale. A perfect fifth (say, C to G) includes three whole tones and a semitone; a diminished fifth is a semitone less, an augmented fifth a semitone more.

Figure. A short phrase, especially one that is repeated.

Fingering. Use of fingers to play instrument, or the indication above notes to show what fingers should be used.

Flat. Term indicating a lowering of pitch by a semitone, or to describe a performer playing under the note.

Florid. Term used to describe decorative passages.

Flute. Woodwind instrument, blown sideways. It is played through a hole, not a reed. Nowadays, sometimes made of metal.

Folksong. Traditional tune, often in different versions, handed down aurally from generation to generation.

Form. Course or layout of a composition, especially when in various sections.

Fourth. Interval taking four steps in scale. A perfect fourth (say, C to F) includes two whole tones and a semitone. If either note is sharpened or flattened the result is an augmented or a diminished fourth.

Fugato. In the manner of a fugue.

Fugue. Contrapuntal composition for various parts based on one or more subjects treated imitatively but not strictly.

G. Note of scale.

Galant. Used to designate elegant style of 18th-cent. music.

Galliard. Lively dance dating back to 15th cent. or before.

Gavotte. Dance in 4/4 time, beginning on third beat in bar.

Giusto. Strict, proper.

Glee. Short part-song.

Glissando. Rapid sliding scales up and down piano or other instruments.

Glockenspiel. Percussion instrument consisting of tuned steel bars and played with two hammers or keyboard.

Grace note. See Ornament.

Grave. In slow tempo.

Grazioso. Gracefully.

Gregorian Chant. Plainsong collected and supervised mainly by Pope Gregory (d. 604).

Ground bass. Figure on theme used as bass in a composition and constantly repeated without change.

Guitar. Plucked string instrument of Spanish origin, having six strings of three-octave compass.

H. German note-symbol for *B.*

Harmony. Simultaneous sounding of notes so as to make musical sense.

Harp. Plucked string instrument of ancient origin, the strings stretched parallel across its frame. The basic scale of C flat major is altered by a set of pedals.

Harpsichord. Keyboard stringed instrument played by means of keyboard similar to a piano but producing its notes by a plucking, rather than a striking action.

Homophonic. Opposite of polyphonic, *i.e.*, indicated parts move together in a compositon, a single melody being accompanied by block chords, as distinct from the contrapuntal movement of different melodies.

Horn. Brass instrument with coiled tubes. Valves introduced in 19th cent. made full chromatic use of instrument possible.

Hymn. Song of praise, especially in church.

Imitation. Repetition, exactly, or at least recognisably, of a previously heard figure.

Impromptu. A short, seemingly improvised piece of music, especially by Schubert or Chopin.

Improvise. To perform according to fancy or imagination, sometimes on a given theme.

In alt. The octave above the treble clef; *in altissimo*, octave above that.

Instrumentation. Writing music for particular instruments, using the composer's knowledge of what sounds well on different instruments.

Interlude. Piece played between two sections of a composition.

Intermezzo. Formerly meant interlude, now often used for pieces played between acts of operas.

Interval. Distance in pitch between notes.

Ionian mode. One of the scales in mediæval music, represented on piano by white keys between C and C, identical therefore to modern C major scale.

Isorhythmic. Term applied to motets of 14th and 15th cent. where rhythm remains strict although melody changes.

Jig. Old dance usually in 6/8 or 12/8 time.

Kettledrum (*Timpani*). Drum with skin drawn over a cauldron-shaped receptacle, can be tuned to definite pitch by turning handles on rim, thus tightening or relaxing skin.

Key. Lever by means of which piano, organ, etc., produces note; classification, in relatively modern times, of notes of a scale. Any piece of music in major or minor is in the *key* of its tonic or keynote.

Keyboard. Term used to describe instruments with a continuous row of keys.

Key-signature. Indication on written musi usually at the beginning of each line, of th number of flats or sharps in the key of a con position.

Kitchen Department. Humorous term for pe cussion section of an orchestra.

Lament. Musical piece of sad or deathly signi cance.

Largamente. Spaciously.

Largo. Slow.

Leading-motive (*Ger. Leitmotiv*). Short them suggesting person, idea, or image, quote throughout composition to indicate that pe son, etc.

Legato. In a smooth style (of performance, etc

Lento. Slow.

Libretto. Text of an opera.

Lied. (pl. *Lieder*). Song, with special referen to songs by Schubert, Schumann, Brahms, ar Wolf.

Lute. String instrument plucked with finger used in 15th- and 16th cent. music especially.

Lydian mode. One of the scales in mediæv music, represented by white keys of pia between F and F.

Lyre. Ancient Greek plucked string instrument

Madrigal. Contrapuntal composition for sever voices, especially prominent from 15th to 17 cent.

Maestoso. Stately.

Major. One of the two main scales of the ton system with semitones between the third ar fourth, and the seventh and eighth note identical with 16th-cent. Ionian mode.

Mandolin(e). Plucked string instrument Italian origin.

Manual. A keyboard for the hands, used most in connection with the organ.

Master of the King's (*or Queen's*) *Musick.* Title British court appointment, with no preci duties.

Melisma. Group of notes sung to a single syllab

Mélodie. Literally a melody or tune; has con to mean a French song (cf. German *Lied*).

Metronome. Small machine in use since t beginning of the 18th cent., to determine t pace of any composition by the beats of t music, *e.g.*, ♩ = 60 at the head of the mus indicates sixty crotchets to the minute.

Mezzo, Mezza. (It. = " half ") *Mezza voce* mea using the half voice (a tone between norm singing and whispering). *Mezzo-soprano*, voi between soprano and contralto.

Minim. Note that equals two crotchets in tin value.

Minor. One of the two main scales of the ton system (cf. major), identical with 16th-cen Aeolian mode. It has two forms—the harmon and melodic, the former having a sharpen seventh note, the latter having the sixth ar seventh note sharpened.

Minuet. Originally French 18th-cent. dance triple time, then the usual third movement symphonic form (with a contrasting trio sectio until succeeded by scherzo.

Mixolydian mode. One of the mediaeval scal represented by the white keys on the piano fro G to G.

Modes. Scales prevalent in the Middle Ages. S Aeolian, Dorian, Ionian, Lydian, Mixolydia Phrygian.

Modulate. Changing from key to key in a con position, not directly but according to musi " grammar ".

Molto. Much, very; thus *allegro molto.*

Motet. Sacred, polyphonic vocal compositio More loosely, any choral composition for use church but not set to words of the liturgy.

Motive, motif. Short, easily recognised melod figure.

otto. Short, well-defined theme recurring throughout a composition, cf. *Idée fixe* in Berlioz's *Symphonie Fantastique.*

ovement. Separate sections of a large-scale composition, each in its own form.

usic drama. Term used to describe Wagner's, and sometimes other large-scale operas.

utes. Devices used to damp the sound of various instruments.

atural (of a note or key). Not sharp or flat.

eo-classical. Term used to describe music written mostly during the 1920s and 30s in the style of Bach or Mozart.

inth. Interval taking nine steps, *e.g.*, from C upwards an octave and a whole tone to D.

octurne. Literally a "night-piece", hence usually of lyrical character.

onet. Composition for nine instruments.

otation. Act of writing down music.

ote. Single sound of specified pitch and duration; symbol to represent this.

bbligato. Instrumental part having a special or essential rôle in a piece.

boe. Woodwind instrument with double reed, descended from hautboy; as such, in use since 16th cent., in modern form since 18th cent.

ctave. Interval taking eight steps of scale, with top and bottom notes having same "name": C to C is an octave.

ctet. Composition for eight instruments or voices.

ndes Martenot. Belongs to a class of melodic instruments in which the tone is produced by electrical vibrations controlled by the movement of the hands not touching the instrument.

pera. Musical work for the stage with singing characters, originated in early years of 17th cent.

pera seria. Chief operatic form of 17th and 18th cent., usually set to very formal librettos, concerning gods or heroes of ancient history.

peretta. Lighter type of opera.

pus. (abbr. *Op.*) With number following *opus* indicates order of a composer's composition.

atorio. Vocal work, usually for soloists and choir with instrumental accompaniment, generally with setting of a religious text.

chestra. Term to designate large, or largish, body of instrumentalists, originated in 17th cent.

chestration. Art of setting out work for instruments of an orchestra. To be distinguished from *Instrumentation* (*q.v.*).

gan. Elaborate keyboard instrument in which air is blown through pipes by bellows to sound notes. Tone is altered by selection of various stops and, since the 16th cent., a pedal keyboard has also been incorporated.

ganum. In mediæval music a part sung as an accompaniment below or above the melody or plainsong, usually at the interval of a fourth or fifth; also, loosely, this method of singing in parts.

nament. Notes that are added to a given melody by composer or performer as an embellishment.

erture. Instrumental introduction or prelude to larger work, usually opera. Concert overtures are simply that: *i.e.*, work to be played at start of a concert.

rt. Music of one performer in an ensemble; single strand in a composition.

rt-song. Vocal composition in several parts.

ssacaglia. Composition in which a tune is constantly repeated, usually in the bass.

ssage. Section of a composition.

ssion. Musical setting of the New Testament story of Christ's trial and crucifixion.

Pastiche. Piece deliberately written in another composer's style.

Pavan(e). Moderately paced dance dating from 16th cent. or earlier.

Pedal. Held note in bass of composition.

Pentatonic Scale. Scale of five notes—usually piano's five black keys or other notes in the same relation to each other.

Percussion. Collective title for instruments of the orchestra that are sounded by being struck by hand or stick.

Phrygian Mode. One of the scales of mediæval music, represented by the white keys on piano from E to E.

Piano. Soft, abbr. *p*; *pp* = *pianissimo*, very soft; instrument, invented in 18th cent., having strings struck by hammer, as opposed to the earlier harpsichord where they are plucked. The modern piano has 88 keys and can be either "upright" (vertical) or "grand" (horizontal).

Pianoforte. Almost obsolete full Italian name for the piano.

Pitch. Exact height or depth of a particular musical sound or note.

Pizzicato. Directions for string instrument, that the strings should be plucked rather than bowed.

Plainchant, Plainsong. Mediæval church music consisting of single line of melody without harmony or definite rhythm.

Polka. Dance in 2/4 time originating in 19th cent. Bohemia.

Polonaise. Polish dance in 5/4 time.

Polyphony. Combination of two or more musical lines as in *counterpoint.*

Polytonality. Simultaneous use of several keys.

Postlude. Closing piece, opposite of Prelude.

Prelude. Introductory piece.

Presto. Very fast. *Prestissimo.* Still faster.

Progression. Movement from one chord to next to make musical sense.

Quartet. Work written for four instruments or voices; group to play or sing such a work.

Quaver. Note that equals two semiquavers or half a crotchet.

Quintet. Work written for five instruments or voices; group to play or sing such a work.

Rallentando. Slowing down.

Recapitulation. Section of composition that repeats original material in something like its original form.

Recitative. Term used for declamation in singing written in ordinary notation but allowing rhythmical licence.

Recorder. Woodwind instrument, forerunner of flute.

Reed. Vibrating tongue of woodwind instruments.

Register. Set of organ pipes controlled by a particular stop; used in reference to different ranges of instrument or voice (*e.g.*, chest register).

Relative. Term used to indicate common key signature of a major and minor key.

Répétiteur. Member of opera house's musical staff who coaches singers in their parts.

Rest. Notation of pauses for instrument in composition, having a definite length like a note.

Retrograde. Term used to describe a melody played backwards.

Rhapsody. Work of no definite kind with a degree of romantic content.

Rhythm. Everything concerned with the time of music (*i.e.*, beats, accent, metre, etc.) as opposed to the pitch side.

Ritornello. Passage, usually instrumental, that recurs in a piece.

Romance, Romanza. Title for piece of vague song-like character.

Romantic. Term used vaguely to describe music of 19th cent. that has other than purely musical source of inspiration.

Rondo. Form in which one section keeps on recurring.

Rubato. Manner of performing a piece without keeping strictly to time.

Sackbut. Early English name for trombone.

Saxophone. Classified as wind instrument, although made of brass, because it uses a reed.

Scale. Progression of adjoining notes upwards or downwards.

Scherzo. One of two middle movements, usually third, in four-movement sonata form. Displaced minuet in this form at beginning of 19th cent.

Score. Copy of any music written in several parts.

Second. Interval taking two steps in scale, *e.g.*, C to D flat, or to D.

Semibreve. Note that equals two minims or half a breve.

Semiquaver. Note that equals half a quaver.

Semitone. Smallest interval commonly used in Western music.

Septet. Composition for seven instruments or voices.

Sequence. Repetition of phrase at a higher or lower pitch.

Serenade. Usually an evening song or instrumental work.

Seventh. Interval taking seven steps in the scale.

Sextet. Composition for six instruments or voices.

Sharp. Term indicating a raising of pitch by a semitone.

Shawm. Primitive woodwind instrument, forerunner of oboe.

Simple time. Division of music into two or four beats.

Sinfonietta. Small symphony.

Sixth. Interval taking six steps in the scale.

Solo. Piece or part of a piece for one performer playing or singing alone.

Sonata. Term to denote a musical form and a type of composition. In *sonata form* a composition is divided into exposition, development and recapitulation. A *sonata* is a piece, usually, for one or more players following that form.

Song. Any short vocal composition.

Soprano. Highest female voice.

Sostenuto. Sustained, broadly.

Sotto voce. Whispered, scarcely audible, applied to vocal as well as instrumental music.

Sprechgesang. (Ger. Speech-song.) Vocal utterance somewhere between speech and song.

Staccato. Perform music in short, detached manner.

Staff. Horizontal lines on which music is usually written.

Stop. Lever by which organ registration can be altered.

String(s). Strands of gut or metal set in vibration to produce musical sounds on string or keyboard instruments. Plural refers to violins, violas, cellos, and basses of orchestra.

Study. Instrumental piece, usually one used for technical exercise or to display technical skill, but often having artistic merits as well (*e.g.* Chopin's).

Subject(s). Theme or group of notes that forms principal idea or ideas in composition.

Suite. Common name for piece in several movements.

Symphony. Orchestral work of serious purpose usually in four movements, occasionally given name (*e.g.*, Beethoven's "Choral" symphony).

Syncopation. Displacement of musical accent.

Tempo. Pace, speed of music.

Tenor. Highest normal male voice.

Ternary. A piece in three sections is said to be in ternary form. The balance is obtained by repeating the first phrase or section (though it need not be exact or complete) after a second of equal importance.

Tessitura. Compass into which voice or instrument comfortably falls.

Theme. Same as *subject* but can also be used for a whole musical statement as in "theme and variations."

Third. Interval taking three steps in scale.

Time. Rhythmical division of music.

Timpani. *See* Kettledrum.

Toccata. Instrumental piece usually needing rapid, brilliant execution.

Tonality. Key, or feeling for a definite key.

Tone. Quality of musical sound; interval of two semitones.

Tonic Sol-fa. System of musical notation to simplify sight-reading.

Transcribe. Arrange piece for different medium, instrument, or voice than that originally intended.

Transition. Passage that joins two themes of sections of a composition.

Transpose. Perform a piece at different pitch from that originally intended.

Treble. Highest part in vocal composition; high boy's voice.

Triad. A chord consisting of a note with the third and fifth above it, *e.g.*, C–E–G. A common chord is a triad of which the 5th is perfect, e.g., C–E–G or C–E flat–G. Thus major and minor triads are common chords.

Trio. Work written for three instruments or voices; group to play or sing such a work.

Trombone. Brass instrument with slide adjusting length of tube.

Trumpet. Metal instrument of considerable antiquity; modern version has three valves to make it into a chromatic instrument.

Tuba. Deepest-toned brass instrument with three or four valves.

Twelve-note. Technique of composition using full chromatic scale with each note having equal importance. Notes are placed in particular order as the thematic basis of works.

Unison. Two notes sung or played together at same pitch.

Valve. Mechanism, invented in early 19th cent., to add to brass instruments allowing them to play full chromatic scale.

Variation. Varied passage of original theme. Such variations may be closely allied to or depart widely from the theme.

Verismo. Term to describe Italian operas written in "realist" style at the turn of this century.

Vibrato. Rapid fluctuation in pitch of voice or instrument. Exaggerated it is referred to as a "wobble" (of singers) or tremolo.

Viol. String instrument of various sizes in vogue until end of 17th cent.

Viola. Tenor instrument of violin family.

Violin. Musical four-string instrument, played with bow, of violin family, which superseded viol at beginning of 18th cent.

Virginals. English keyboard instrument, similar to harpsichord of 17th and 18th cent.

Vivace. Lively.

oluntary. Organ piece for church use, but not during service.

'altz. Dance in triple time, fashionable in 19th cent.

'hole-tone scale. Scale progressing by whole tones. Only two are possible, one beginning on C, the other on C sharp.

Xylophone. Percussion instrument with series of wood bars tuned in a chromatic scale and played with sticks.

Zither. String instrument laid on knees and plucked. Common in Central-European folk music.

III. INDEX TO COMPOSERS

lam de la Halle (d. 1287) . . . . . 3(2)
béniz, Isaac (1960–1909) . . . . . . 15(1)
lbinoni, Tommaso (1671–1750) . . . . 6(1)
rcadelt (*c.* 1514–*c.* 1570) . . . . . . 4(2)

ach, Carl Philipp Emanuel (1714–88) . 7(1)
ach, Johann Sebastian (1685–1750) . . 6
alakireff, Mily (1837–1910) . . . . . 11(2)
arber, Samuel (b. 1910) . . . . . . 18(2)
artók, Bela (1881–1945) . . . . . . 12(2)
ax, Sir Arnold (1883–1953) . . . . . 18(2)
eethoven, Ludwig van (1770–1827) . . 8
ellini, Vincenzo (1801–35) . . . . . 10(1)
ennett, Richard Rodney . . . . . . 19(2)
erg, Alban (1885–1935) . . . . . . 16(2)
erkeley, Lennox (b 1903) . . . . . 19(2)
erlioz, Hector (1803–69) . . . . . . 9(1)
nchois, Gilles (*c.* 1400–60). . . . . . 4(1)
iss, Sir Arthur (b. 1891) . . . . . . 19(2)
ow, John (1649–1708) . . . . . . 5(2)
ccherini, Luigi (1743–1805) . . . . 8(2)
ito, Arrigo (1842–1918) . . . . . . 10(2)
rodin, Alexander (1834–87) . . . . . 11(2)
ulez, Pierre (b. 1925) . . . . . . 18(1)
ahms, Johannes (1833–97) . . . . . 10(2)
itten, Benjamin (b. 1913) . . . . . 18(2)
uckner, Anton (1824–96) . . . . . . 10(2)
soni, Ferruccio (1866–1924) . . . . 17(1)
rd, William (*c.* 1542–1623) . . . . . 4(2)

bézon, Antonio de (1510–66) . . . . 4(2)
ccini, Giulio (*c.* 1558–1615) . . . . . 5(1)
rissimi, Giacomo (*c.* 1604–74) . . . . 5(1)
valieri, Emilio di (*c.* 1550–1600) . . . 5(2)
valli, Pietro Francesco (1602–76) . . . 5(1)
sti, Marc'Antonio (1623–69) . . . . . 5(1)
opin, Frédéric François (1810–49) . . 9(2)
narosa, Domenico (1749–1801) . . . . 8(2)
pland, Aaron (b. 1900) . . . . . . 18(1)
relli, Arcangelo (1653–1713) . . . . 6(1)

Goehr, Alexander . . . . 19(2)
Gounod, Charles (1818–93) . . . . . . 13(2)
Granados, Enrique (1867–1916) . 14(2), 15(1)
Grieg, Edvard (1843–1907) . . . . . . 13(2)
Guido d'Arezzo (*c.* 990–1050) . . . . . 3(2)
Guillaume de Machaut (1300–77) . . . 4(1)

Halévy, Jacques François (1799–1862) . 10(1)
Handel, George Frederic (1685–1759) . . 6(2)
Hauer, Josef (1883–1959) . . . . . . 16(1)
Haydn, Franz Joseph (1732–1809) . . . 7
Henze, Hans Werner (b. 1926) . . . . 18(1)
Hindemith, Paul (1895–1963) . . . . . 18(1)
Holst, Gustav (1874–1934) . . . . . 18(2)
Honegger, Arthur (1892–1955) . . . . 18(1)
Hummel, Johann Nepomuk (1778–1837) . 8(2)

Ireland, John (1879–1962) . . . . . . 18(2)
Ives, Charles (1874–1954) . . . . . . 18(2)

Janáček, Leoš (1858–1928) 12(2)
Josquin des Prés (c. 1450–1521) 4(1)

Kodály, Zoltán (1882–1967) 13(1)

Landini, Francesco di (c. 1325–97) 4(1)
Lassus, Orlandus (c. 1532–94) 4(2)
Lawes, Henry (1596–1662) 5(2)
Leoncavallo, Ruggiero (1858–1919) 17(2)
Léonin (12th cent.) 3(2)
Liszt, Franz (1811–86) 9(1)
Lully, Jean-Baptiste (c. 1632–87) 5(2)
Lutyens, Elisabeth (b. 1906) 19(2)

MacDowell, Edward Alexander (1861–1908) 18(1)
Mahler, Gustav (1860–1911) 15(2)
Mascagni, Pietro (1863–1945) 17(2)
Massenet, Jules Emile Fréderic (1842–1912) 13(2)
Maw, Nicholas 19(2)
Méhul, Etienne Nicolas (1763–1817) 8(2)
Mendelssohn, Felix (1809–47) 9(1)
Messiaen, Olivier (b. 1908) 18(1)
Meyerbeer, Giacomo (1791–1864) 10(1)
Milhaud, Darius (b. 1892) 18(1)
Monte, Philippe de (c. 1521–1603) 4(1)
Monteverdi, Claudio (1567–1643) 5(1)
Mozart, Wolfgang Amadeus (1756–91) 7
Mussorgsky, Modest (1839–81) 11(2)

Nielsen, Carl (1865–1931) 13
Neri, Saint Philip (1515–95) 5(2)

Ockeghem (c. 1420–95) 4(1)
Orff, Carl (b. 1985) 18(1)

Pachelbel, Johann (1653–1706) 6(1)
Paisiello, Giovanni (1740–1816) 8(2)
Palestrina (c. 1525–94) 4(2)
Parry, Sir Hubert (1848–1918) 13(2)
Pedrell, Felipe (1841–1922) 14(2)
Péri, Jacopo (1561–1633) 5(1)
Pérotin (early 12th cent.) 3(2)
Pfitzner, Hans (1869–1949) 15(2)
Philippe de Vitry (1291–1361) 4(1)
Poulenc, Francis (1899–1963) 18(1)
Power, Lionel (15th cent.) 4(1)
Prokofiev, Sergey (1891–1953) 17(2)
Puccini, Giacomo (1858–1924) 17(1)
Purcell, Henry (1658–95) 5(2)

Rachmaninov, Sergey (1873–1943) 17(2)
Rameau, Jean-Philippe (1683–1764) 6(1)
Ravel, Maurice (1875–1937) 14(2
Rawsthorne, Alan (b. 1905) 19(1)
Reger, Max (1873–1916) 15(2)
Rimsky-Korsakov, Nikolai (1844–1908) 11(2)
Rossini, Gioacchino Antonio (1792–1868) 9(2)
Rubbra, Edmund (b. 1901) 19(2)

Saint-Saëns, Camille (1835–1921) 14(1)
Satie, Eric (1866–1925) 18(1)
Scarlatti, Alessandro (1660–1725) 5(2)
Scarlatti, Domenico (1685–1737) 7(1)
Scheidt, Samuel (1587–1654) 5(2)
Schein, Johann Hermann (1586–1630) 5(2)
Schoenberg, Arnold (1874–1951) 16
Schubert, Franz Peter (1797–1828) 8(2)
Schumann, Robert Alexander (1810–56) 9(1)
Schütz, Heinrich (1585–1672) 5(2)
Scriabin, Alexander (1872–1915) 16(1)
Shostakovich, Dmitri (b. 1906) 17(2)
Sibelius, Jean (1865–1957) 13(1)
Smetana, Bedřich (1824–84) 12(1)
Spontini, Gasparo Luigi Pacifico (1774–1851) 10(1)
Stradella, Alessandro (1642–82) 5(1)
Stanford, Sir Charles Villiers (1852–1924) 13(2)
Stamitz, Johann (1717–57) 6(1)
Stamitz, Karl (1746–1801) 6(1)
Stockhausen, Karlheinz (b. 1928) 18(1)
Strauss, Richard (1864–1949) 15(1)
Stravinsky, Igor (b. 1882) 16(2)
Sweelinck, Jan Pieterszoon (1562–1621) 6(1)

Tchaikovsky, Peter Ilitch (1840–93) 12(1)
Tippett, Sir Michael (b. 1905) 19(1)
Torelli, Giuseppe (1658–1709) 6(1)
Turina, Josquin (1882–1949) 15(1)

Varèse, Edgard (1885–1965) 18(1)
Vaughan Williams, Ralph (1872–1958) 18(2)
Verdi, Giuseppe (1813–1901) 10(1)
Victoria, Tomás Luis de (c. 1535–1611) 4(2)

- World Energy Resources 44
- The Electromagnetic Spectrum 48
- Immunology 50
- The Contraction of Muscles 54
- Drugs Acting on the Brain 56

THE WORLD OF SCIENCE

IENCE is not to be confined in laboratories, nor is it exclusively the concern of highly trained ecialists. Science has many links, mutually fertile ones, with technology of all kinds, and through hnology science changes the aspect of cities, the way of life of peasants, the effectiveness of drugs, routines of work, the comforts of homes. Science brings knowledge and understanding; indeed it the most powerful system ever devised for accumulating knowledge and deepening understanding.

Because of its all pervasive social effects, because of the ambiguity of some of its gifts, science pre- its us with moral choices and therefore enters as an inescapable factor into politics and the arts. vertheless, for some scientists, understanding alone would be a sufficient prize to justify their tient studies and it is in this spirit that, in the following pages, a number of scientists have tried to plain in simple language how the universe appears to them at this time.

In Part I the inanimate universe is described. This is the domain of cosmology, astronomy, geology, ysics, and chemistry. There are already many interesting links which join this realm to that of the ing and make it difficult to say where the boundary lies. Nevertheless it is still convenient to cord to the biological and social sciences two separate chapters, Parts II and III. In Part IV our ention is to give some short accounts of recent developments in both science and technology. They contributed by scientists actively engaged in these, their own special fields.

I. THE STRUCTURE AND ORIGIN OF THE UNIVERSE

The universe includes everything from the allest sub-atomic particle to the mightiest tem of stars. The scientific view of the uni- se (not the only view but the one we are con- ned with here) is a remarkable achievement of human mind, and it is worth considering at outset what a "scientific view" is, and what is arkable about it.

A scientific view of something is always an inti- te mixture of theories and observed facts, and an inert mixture but a seething and growing . The theories are broad general ideas to- her with arguments based on them. The uments are designed to show that, if the general as are accepted, then this, that, or the other ng ought to be observed. If this, that, or the er actually are observed, then the theory is a d one; if not, then the theoreticians have to nk again. Thus theoretical ideas and argu- nts are continually subjected to the severe test comparison with the facts, and scientists are ud of the rigour with which this is done. On other hand, theories often suggest new things look for, *i.e.*, theories lead to predictions. se predictions are frequently successful, and ntists are entitled to be proud of that too. it follows that no theory is immutable; any ntific view of any subject may, in principle, invalidated at any time by the discovery of facts, though some theories are so soundly ed that overthrow does not seem imminent.

remarkable aspect of the scientific view of the verse is that same principles are supposed to rate throughout the whole vastness of space. s the matter and radiation in stars are not erent from the matter and radiation on earth, their laws of behaviour are the same. There- theories hard won by studies in terrestrial sics and chemistry laboratories are applied at e to the whole cosmos. Astronomy and cos- ogy are spectacular extensions of ordinary hanics and physics.

LOOKING AT THE UNIVERSE.

he universe is observable because signals from each us and some manage to penetrate our osphere.

irst, there are waves of visible light together invisible rays of somewhat longer (infra-red) somewhat shorter (ultra-violet) wavelengths. se waves show us the bright astronomical cts and, to make use of them, astronomers have constructed telescopes of great power and precision backed up with cameras, spectroscopes, and numerous auxiliaries. The most powerful telescope, at Mt. Palomar, California, has a 200-in.-diameter mirror. The next major advance in optical telescope performance probably awaits the erection of telescopes on satellites outside the earth's atmosphere, which at present acts as a distorting and only partially transparent curtain.

Secondly, there are radio waves of much longer wavelength than light. These can be detected by sensitive radio receivers with special aerial systems. These are the radio telescopes. The most well known British one is at Jodrell Bank and it started working in 1957.

Other types of radiation from outer space impinge on the atmosphere. Cosmic radiation consists of very fast-moving fundamental particles, including protons (**F14**). Cosmic rays are detected by Geiger counters, by the minute tracks they leave on photographic plates, and by other means. The origin of cosmic rays is still uncertain, but many people think they must have an intimate connection with the nature and evolution of the universe itself.

X-rays and neutrinos (**F14**) from outer space can also be detected, the former especially by satellite-borne detectors and the latter by apparatus buried in deep mines. X-ray astronomy and neutrino astronomy are being born.

By interpreting the signals that reach us by these various routes, astronomers have formed a remarkably detailed picture of its structure. The merest outline of this will now be given.

Great Distances and Large Numbers.—Let us start with nearby objects. This raises at once the question of what "nearness" and "distance" are in astronomy and how they are to be expressed. A convenient unit of distance is the *light-year*, *i.e.*, the distance that light, travelling at 186,000 miles per second, traverses in one year. Since vast numbers as well as vast distances will enter the question, we need a shorthand for large numbers. Ten times ten times ten will be represented by 10^3; six tens multiplied together (*i.e.*, one million) will be written 10^6, and so on. 10^{14} would mean a hundred million million. One divided by a million (*i.e.*, one-millionth) will be written 10^{-6}; the very small number obtained by dividing one by the product of fourteen tens will be written 10^{-14}. A light-year is $5{\cdot}88 \times 10^{12}$ miles; the radius of an atom is about 10^{-8} cm.

The Solar System.—The earth is the third, counting outwards, of nine planets revolving in nearly circular orbits round the sun. Their names and some other particulars are given in the table (**F7**). The sun and its planets are the main bodies of the solar system. Between Mars and Jupiter revolve numerous chunks of rock called the asteroids; the largest of these, Ceres, is 480 miles across. Apart from these, the solar system is tenuously populated with gas, dust, and small particles of stone and iron. Dust continuously settles on the earth, and frequently small fragments enter the atmosphere, glow, and evaporate; these are meteors or shooting stars. Sometimes larger rocks, called meteorites, hit the earth. Comets are relatively compact swarms of particles—containing ice according to one theory—which travel in elongated orbits round the sun. Their spectacular tails form under the sun's influence when they approach it. Not all comets stay indefinitely in the solar system; some visit us and go off into space for ever.

The sun itself is a dense, roughly spherical mass of glowing matter, 865,000 miles across. Its heat is so intense that the atoms are split into separated electrons and nuclei (*see* **F10**) and matter in such a state is called plasma. At the sun's centre the temperature has the unimaginable value of about 13 million degrees Centigrade (a coal fire is about 800° C.). Under such conditions the atomic nuclei frequently collide with one another at great speeds and reactions occur between them. The sun consists largely of hydrogen and, in the very hot plasma, the nuclei of hydrogen atoms interact by a series of reactions whose net result is to turn hydrogen into helium. This is a process which releases energy just as burning does, only these nuclear processes are incomparably more energetic than ordinary burning. In fact, the energy released is great enough to be the source of all the light and heat which the sun has been pouring into space for thousands of millions of years.

We may note in passing that the occurrence of these energy-producing reactions in sufficiently hot plasmas is the reason why so much effort is nowadays put into the study of plasma physics. There are many experiments being made to produce and contain hot plasma. They are man's attempts to imitate on earth the energy-giving processes in the sun.

Stars.—In colour, brightness, age, and size the sun is typical of vast numbers of other stars. Only from the human point of view is there anything special about the sun—it is near enough to give us life. Even the possession of a system of revolving planets is not, according to some modern views, very unusual.

No star can radiate energy at the rate the sun does without undergoing internal changes in the course of time. Consequently stars evolve and old processes in them give rise to new. The exact nature of stellar evolution—so far as it is at present understood—would be too complex to describe here in any detail. It involves expansion and contraction, changes of temperature, changes of colour, and changes in chemical composition as the nuclear processes gradually generate new chemical elements by reactions such as the conversion of hydrogen to helium, helium to neon, neon to magnesium, and so on. The speed of evolution changes from time to time, but is in any case very slow compared with the pace of terrestrial life; nothing very dramatic may occur for hundreds of millions of years. Evidence for the various phases of evolution is therefore obtained by studying many stars, each at a different stage of its life. Thus astronomers recognise many types with charmingly descriptive names, such as blue giants, sub-giants, red and white dwarfs, supergiants.

The path of stellar evolution may be marked by various explosive events. One of these, which occurs in sufficiently large stars, is an enormous explosion in which a substantial amount of the star is blown away into space in the form of high-speed streams of gas. For about a fortnight, such an exploding star will radiate energy 200 million times as fast as the sun. Japanese and Chinese (but not Western) astronomers recorded such an occurrence in A.D. 1054, and the exploding gases, now called the Crab nebula, can still be seen i
powerful telescopes and form a cloud six or seve
light-years across. While it lasts, the explosio
shows up as an abnormally bright star and i
called a *supernova.*

Groups of Stars.—It is not surprising tha
ancient peoples saw pictures in the sky. Th
constellations, however, are not physically con
nected groups of stars but just happen to b
patterns visible from earth. A conspicuous excep
tion to this is the Milky Way, which a telescop
resolves into many millions of separate stars. I
we could view the Milky Way from a vast distanc
and see it as a whole we should observe a rathe
flat wheel of stars with spiral arms something lik
the sparks of a rotating Catherine wheel. Thi
system of stars is physically connected by gravita
tional forces and moves through space as a whole
it is called a *galaxy.*

The galaxy is about 10^5 light-years across an
contains roughly 10^{11} stars. An inconspicuou
one of these stars near the edge of the wheel is ou
sun; the prominent stars in our night sky ar
members of the galaxy that happen to be rathe
near us. Sirius, the brightest, is only 8·6 light
years away, a trivial distance, astronomicall
speaking.

The galaxy does not contain stars only, there ar
also clouds of gas and dust, particularly in th
plane of the galaxy. Much of the gas is hydrogen
and its detection is difficult. However, gaseou
hydrogen gives out radio waves with a wave
length of 21 cm. Radio telescopes are just th
instruments to receive these, and workers i
Holland, America, and Australia detected the ga
clouds by this means. In 1952 they found tha
the hydrogen clouds lie in the spiral arms of th
galaxy, and this is some of the strongest evidenc
for the spiral form.

Another important feature of the galactic scen
is the weak but enormously extensive magneti
field. This is believed to have an intimate con
nection with the spiral structure.

Around the spiral arms, and forming part of th
galaxy, are numerous globular clusters of stars
These are roughly spherical, abnormally densel
packed, collections of stars with many thousand
of members. Because of its form and density,
globular cluster may be assumed to have bee
formed in one process, not star by star. Thus a
its stars are the same age. This is of great interes
to astronomers, because they can study difference
between stars of similar age but different sizes.

Galaxies.—One might be forgiven for assumin
that such a vast system as the galaxy is in fact th
universe; but this is not so. In the constellatio
of Andromeda is a famous object which, on clos
examination, turns out to be another galaxy
size and structure similar to our own. Its distanc
is given in the table (**F7**). The Milky Way, th
Andromeda Nebula, and a few other smalle
galaxies form a cluster of galaxies called the Loc
Group. Obviously it would not be so name
except to distinguish it from other distinct group
and it is indeed a fact that the universe is popu
lated with *groups*, or *clusters*, of *galaxies*.
cluster may contain two or three galaxies, bu
some contain thousands. So far as the eye
the telescope and camera can see, there a
clusters of galaxies.

On a photograph a galaxy is a nebulous bl
without the hard outline that a single star pr
duces. Such nebulæ were formerly thought
be inside the Milky Way, but, after controversy,
was established that many of them were separa
distant galaxies. By about 1920 it was know
that there were at least half a million galaxie
and with the advent of the 100-in. Mt. Wils
telescope this number rose to 10^8 and is bei
increased further by the 200-in. telescope whi
can see out to a distance of 7×10^9 light-yea
Through the powerful telescopes the near
galaxies reveal their inner structures. Phot
graphs of galaxies are among the most beauti
and fascinating photographs ever taken, a
readers who have never seen one should hasten
the nearest illustrated astronomy book. Rece
careful co-operation between optical and radi
astronomers has revealed that some very remo

laxies are strong sources of radio waves.
ometimes these radio galaxies have unusual
ructures suggestive of violent disturbance.

The Expanding Universe.—Two discoveries
oout galaxies are of the utmost importance.
ne is that, by and large, clusters of galaxies are
niformly distributed through the universe. The
her is that the distant galaxies are receding
om us.

How is this known? Many readers may be
miliar with the Doppler effect first discovered in
842. Suppose a stationary body emits waves of
ny kind and we measure their wavelength, find-
g it to be *L* ins. Now suppose the body ap-
oaches us; the waves are thereby crowded
gether in the intervening space and the wave-
ngth appears less than *L*; if the body recedes
e wavelength appears greater than *L*. The
ustrian physicist, J. Doppler (1803–53), dis-
overed this behaviour in sound waves, and it
plains the well-known change of pitch of a train
histle as it approaches and passes us. The
me principle applies to the light. Every atom
nits light of definite wavelengths which appear
a spectroscope as a series of coloured lines—a
fferent series for each atom. If the atom is in a
ceding body all the lines have slightly longer
avelengths than usual, and the amount of the
ange depends uniquely on the speed. Longer
avelengths mean that the light is redder than
ual, so that a light from a receding body shows
hat is called a "red shift." The speed of
cession can be calculated from the amount of
d shift.

It was the American astronomer, V. M. Slipher,
ho first showed (in 1914) that some galaxies
nitted light with a red shift. In the 1920s and
930s the famous astronomer E. Hubble (1889–
953) measured both the distances and red shift
many galaxies and proved what is now known
Hubble's Law. This states that the speed of
cession of galaxies is proportional to their
stance from us. This does not apply to our
ighbours in the Local Group, we and they are
eping together. Hubble's Law has been tested
d found to hold for the farthest detectable
laxies; they are about 7×10^9 light-years
ay and are receding with a speed $\frac{2}{3}$ of that of light.

Does this mean that the Local Group is the
ntre of the universe and that everything else is
shing away from us? No: Hubble's Law
ould appear just the same from any other cluster
galaxies. Imagine you are in a square on some
bulous chess board which is steadily doubling
s size every hour; all other squares double their
stances from you in an hour. Therefore the
rther squares from you must travel faster than
e nearer ones; in fact, Hubble's Law must be
beyed. But anyone standing in any other square
ould get the same impression.

This extraordinary behaviour of the universe
one of the most exciting discoveries of science.
et us envisage one possible implication. If the
laxies have always been receding, then in the
st they must have been closer together. Fol-
wing this to its conclusion, it seems that all the
atter in the universe must have been packed
nsely together about 10^{10} years ago. Was this
ally so? The lack of any definite answer to this
estion is one of the things that makes cosmology
interesting.

Quasi-stellar Objects.—In November 1962
stralian radio-astronomers located a strong
dio emitter with sufficient precision for the Mt.
lomar optical astronomers to identify it on
otographs and examine the nature of its light.
e red shift was so great that the object must be
ceedingly distant; on the other hand it looked
r-like, much smaller than a galaxy. By the
ginning of 1967 over a hundred of these objects
d been discovered and other characteristics
ablished, such as strong ultra-violet radiation
d inconstancy, in some cases, of the rate at
ich radiation is emitted. Not all the quasi-
llar objects are strong radio emitters; some
ow all the other characteristics except radio
ission. It has been estimated that the "quiet"
d are about a hundred times more numerous
an the radio kind. One great problem here is:
w can such relatively small objects generate
ch inconceivably great amounts of energy that they appear bright at such huge distances? So far this is unanswered; these quasi-stellar objects are a great mystery, though they are generally held to be an important pointer towards a deeper understanding of cosmology.

It is not absolutely certain that the quasi-stellar objects are very distant. Their large red shifts might indicate that they have very large recession velocities while being quite close to our galaxy. But then one would have to explain why they are all going *away* from us, *i.e.*, why there are none (so far) that show a blue shift.

THE ORIGIN OF THE UNIVERSE.

Errors of observation and interpretation occur of course. But there are many checks and repetitions made, so that, on the whole, the descriptive account of the universe would be generally agreed among astronomers. When it comes to inventing theoretical explanations, however, science is on less sure ground, and indeed the theory of the universe is an arena of controversy at present. In most other sciences experiments can be repeated and the same phenomena observed under differing but controlled conditions. This is very helpful. But, by definition, there is only one universe; one cannot repeat it or do experiments with it. On the other hand, it must be remembered that the light from distant galaxies has taken perhaps 10^9 years to reach us, so it tells us what the galaxies were like that number of years ago. Therefore we are not confined simply to describing the present state of the universe; by looking farther into space we are looking farther into the past as well. How, then, does the state of the universe vary with time?

Evolutionary Theories.—One answer to this can be obtained from Einstein's general theory of relativity. Some slight indication of what this theory is about is given on page **F15**, and its logical development is, of course, a matter for mathematical specialists. It turns out that, if we assume that matter is distributed uniformly throughout space (as observation strongly suggests), then the solutions of Einstein's equations show how the state of the universe may vary with time. Unfortunately there are many possible solutions corresponding to expanding, static, or contracting universes. As we have already seen, the actual universe is expanding, therefore the static and contracting solutions can be ruled out. There is still a multiplicity of expanding possibilities: some correspond to indefinite expansion from an initially very dense state, others to expansion followed by contraction to a dense state followed by expansion and so on repeatedly, *i.e.*, a *pulsating* universe. The "dense state" is presumably to be identified with the time when the receding galaxies were all concentrated near one another, possibly in some dense conglomeration of atoms. This initial state is thought by some to be the origin of the universe; they would say it has been expanding and evolving ever since. If the universe is pulsating, then sooner or later, gravitational attractions between galaxies will slow the observed recession down and turn it into a mutual approach and so back to the dense state. A straightforward application of the mathematics makes this dense state *infinitely* dense, and presumably something must happen before this inconceivable situation arises. For example, forces between atomic nuclei may play an important part and determine what the dense state (if any) is actually like.

The Steady-State Theory.—A rival theory was proposed in 1948 by Bondi, Gold, and Hoyle. They suggested that the universe is not changing with time; there was no initial dense state and no pulsations; the universe always has been, and always will be, like it is now. This does not mean that no local changes can be observed—this would clearly be contrary to the facts. But it does mean that, on the large scale, the clusters of galaxies have a distribution which is uniform in space and unchanging in time. If the numbers of clusters of galaxies in a large volume of space were counted every few thousand million years the answer would always be the same.

At first sight this appears to contradict outright the observed expansion of the universe. For if the galaxies are receding from one another how can the number in a given volume remain constant? The situation is saved by a bold proposal. It is that matter, in the form of hydrogen atoms, is being *continuously created* throughout space. This gas accumulates in due course into new galaxies, so that as the old ones move apart the young ones appear to keep the numbers up. The necessary amount of continuous creation can be calculated and is equivalent to the appearance of one atom in an average-sized room every 20 million years. If this seems absurdly small, try calculating the rate of creation in tons per second in a sphere of radius 10^9 light-years.

The rate of creation is, however, much too small to have affected any of the laws of ordinary physics. The famous law of the conservation of matter ("matter can neither be created nor destroyed") is violated, but on such a small scale that physicists, it is said, should not complain. Nevertheless, some do complain and see in this violation a strong point against this theory.

The Formation of Galaxies and Stars.—On any theory of the universe, some explanation has to be found for the existence of clusters of galaxies. In all theories galaxies condense out from dispersed masses of gas, principally hydrogen.

According to the evolutionary theory, the "initial dense state" consisted of very hot plasma in a state of overall expansion. The expanding plasma was both cooling and swirling about. The random swirling produces irregularities in the distribution of the hot gas—here it would be rather denser, there rather less dense. If a sufficiently large mass of denser gas happened to occur, then the gravitational attraction between its own particles would hold it together and maintain its permanent identity, even though the rest of the gas continued to swirl and expand. Such a large mass would gradually condense into fragments to become galaxies, the whole mass turning into a cluster of galaxies.

The steady-state view is interestingly and significantly different, for, on this theory, galaxies have always been present, and the problem is one of finding how existing galaxies can generate new ones out of the hydrogen gas which is supposed to be continuously created everywhere. Moreover, this was to be done at just the right rate to maintain the galactic population density constant—otherwise it would not be a *steady-state* theory.

Inside galaxies there is an average density of the order of 10 or 20 hydrogen atoms per cubic inch; between galaxies, the density is 10^6 times less. Consequently we can imagine the relatively dense galaxy attracting the surrounding gas towards it by gravitation. If the galaxy were stationary the gas would presumably form an accretion to the galaxy. But imagine the galaxy to be moving through inter-galactic space. Then the combined effect of gravitation and motion is to create a region of increased gas density in the wake of the galaxy. This concentration in the wake becomes sufficiently large and dense to condense itself, by its own gravitational attraction, into a new galaxy. The offspring may either stay near the parent, forming an embryonic cluster of galaxies, or separate. In either case the process is repetitive and leads to the required stability in the number of galactic clusters.

Once a huge gas cloud becomes sufficiently condensed to be separately identifiable as a galaxy, further condensation goes on inside it. It is believed on theoretical grounds that it could not condense into one enormous star but must form many fragments which shrink separately into clusters of stars. In these clusters many stars, perhaps hundreds or thousands or even millions, are born at once. A small cluster, visible to the naked eye, is the Pleiades. The Orion nebula, visible as a hazy blob of glowing gas in the sword of Orion, is the scene of much star-forming activity at present.

The Changing Scene.—The 1960s are seeing revolutionary developments in both observational and theoretical astronomy. Already the attractive simplicity of the original steady-state theory has been obscured by modifications forced upon its protagonists by new evidence or theoretical objections. For example, it now seems agreed after some years of uncertainty that remote sources of radio waves are the more abundant the weaker their intensity. This strongly suggests that they are more abundant at greater distances. Thus the universe is not *uniform* as the original steady state theory prescribed. Since greater distances correspond to earlier times, any extra abundance of objects observed at the greater distance means that the universe was denser in its younger days than now. This favours an evolutionary theory of the universe.

Theoretical objections have also been raised to the proposals for the formation of galaxies from matter which is continuously created at all places as described above. New developments of the steady-state theory emphasise a postulated inhomogeneity of the universe: creation and expansion occurring to different degrees in different regions but all within an infinitely extended space. By this device it is possible to reconcile an overall steady-state universe with local regions (such as the one we observe) possessing evolutionary characteristics like a concentration of quasars at great distances.

On the observational side there has even been a suggestion that the initial dense state (postulated in the evolutionary theory) was accompanied by the generation of electromagnetic waves which can still be detected as they echo round the universe: such is the interpretation of a weak radio whisper received on the most sensitive apparatus (developed for satellite communications) and not attributable to any known cosmic or terrestrial source.

The Formation of the Chemical Elements.—A stable nucleus is one that lasts indefinitely because it is not radioactive. There are 284 known kinds of stable atomic nuclei and little likelihood of any more being found. These nuclei are the isotopes (*see* **F10**) of 83 different chemical elements; the other elements, including, for example, uranium and radium are always radioactive. Some elements are rare, others abundant. The most common ones on earth are oxygen, silicon, aluminium, and iron. However, the earth is rather atypical. It is especially deficient in hydrogen, because the gravitational attraction of our small planet was not strong enough to prevent this very light gas from escaping into space.

It is possible to examine the chemical constituents of meteorites and to infer the composition of the sun and other stars from the spectrum of the light they emit. By such means, the conclusion has been reached that 93% of the atoms in our galaxy are hydrogen, 7% are helium; all the other elements together account for about one in a thousand atoms. A glance at the Table of Elements on page N32 will show that hydrogen and helium are two of the lightest elements; they are in fact the two simplest.

According to the steady-state theory, hydrogen atoms are constantly being created. The evolutionary theory supposes that the dense initial state was a system of very hot protons and electrons, *i.e.*, split-up hydrogen atoms. In either case, therefore, the problem is to explain how the heavier chemical elements appear in the universe at all. It is here that a fascinating combination of astronomy and nuclear physics is required.

We have already referred to the fact that the energy radiated from the sun originates in nuclear reactions which turn hydrogen into helium. Why is energy given out? To answer this question we note that nuclei are made up of protons and neutrons (*see* **F10**). These particles attract one another strongly—that is why a nucleus holds together. To separate the particles, energy would have to be supplied to overcome the attractive forces. This amount of energy is called *binding energy* and is a definite quantity for every kind of nucleus. Conversely, when the particles are brought together to form a nucleus the binding energy is *released* in the form of radiations and heat. Different nuclei consist of different numbers of particles, therefore the relevant quantity to consider is the *binding energy per particle*. Let us call this B. Then if elements of *high* B are formed out of those of *low* B there is a *release* of energy.

Now B is small (relatively) for light elements ke lithium, helium, and carbon; it rises to a aximum for elements of middling atomic weight ke iron; it falls again for really heavy elements ke lead, bismuth, and uranium. Consequently, ergy is released by forming middleweight ele- ents either by splitting up heavy nuclei “ nuclear fission ”) or by joining up light ones “ nuclear fusion ”).

It is the latter process, fusion, that is going on n stars. The fusion processes can be studied in hysics laboratories by using large accelerating achines to hurl nuclei at one another to make nem coalesce. In stars the necessary high elocity of impact occurs because the plasma is so ot. Gradually the hydrogen is turned into elium, and helium into heavier and heavier ements. This supplies the energy that the stars diate and simultaneously generates the chemical ements.

The very heavy elements present a problem. To orm them from middleweight elements, energy as to be *supplied*. Since there is plenty of ergy inside a star, a certain small number of eavy nuclei will indeed form, but they will con- nually undergo fission again under the prevailing tense conditions. How do they ever get away o form cool ordinary elements, like lead and ismuth, in the earth? One view links them with e highly explosive supernovæ, to which we have ready referred (**F4** (2)). If the heavy elements ccur in these stars the force of the explosion isperses them into cool outer space before they ave time to undergo the fission that would therwise have been their fate. The heavy ele- ents are thus seen as the dust and debris of ellar catastrophes. This view is in line with e steady-state theory, because supernovæ are ways occurring and keeping up the supply of eavy elements. In the evolutionary theory ome of the generation of elements is supposed to o on in the very early stages of the initial dense ate and to continue in the stars that evolve in e fullness of time. It cannot be claimed that e origin of the chemical elements is completely nown, but we have said enough to show that ere are plausible theories. Time and more cts will choose between them.

The Formation of the Planets.—Did the sun llect its family of planets one by one as a result chance encounters in the depths of space? Or as the solar system formed all at once in some enerative process? To this fundamental ques- on at least there is a fairly definite answer. The anetary orbits all lie in about the same plane and the planets all revolve the same way round the sun. This could hardly have happened by chance; indeed, it provides almost conclusive evidence for the alternative view. But what was the generative process?

Many ideas have been proposed, and the problem is very intricate. One view is that the sun and its planets formed in a stellar condensation, a feature of which was the pushing outwards from the central sun of a disc of matter which subsequently became the planets. Such a process would be regarded as normal in stars, and not exceptional.

On the other hand, the planets have been attributed to the effect of a passing star whose gravitational attraction drew out from the sun a jet of gaseous matter which condensed into the planets. Such an encounter between stars is very rare and, on this theory, the formation of planets must be an outside chance. This theory is not widely held now.

The connection between stellar and planetary theory is brought out again by the existence on the planets of the heavier chemical elements. How did they get there? If it be true that heavy elements are hurled into space by exploding supernovæ (see above), then at least one such explosion must have mingled its products with the widespread interstellar hydrogen before the planets condensed. At one time Hoyle put forward the view that the sun was once accompanied by another star (there are many such binary systems known to astronomers) and that the sun's partner exploded. Some of the ejected gases, captured by the sun's gravitational attraction, later condensed into planets, while the remnant of the star recoiled from the explosion and got away into space. This explanation was later modified in that the exploding star and the sun need not be a close pair but merely two of a cluster of stars formed at the same time.

Before leaving this subject, where theories are more numerous than firm conclusions, one more question may be raised: was the earth formed hot or cold? There are adherents to both opinions. One side would say that the planets condensed from hot gases, became liquid, and subsequently cooled and solidified, at the surface if not throughout. Others would say that dust, ice, and small particles formed in space first and subsequently accumulated into large bodies, whose temperature rose somewhat later on. With space exploration beginning in earnest, considerable future progress in understanding planetary formation can be anticipated. (*See also* **Section L: Mars, Venus, Planets**).

THE EARTH.

Shape and Size.—The earth has the form of a slightly flattened sphere, the polar radius being 6,357 km. (3,950·4 miles) and the equatorial radius 6,378 km. (3,963·5 miles). Its mass is $5{\cdot}97 \times 10^{27}$ gm. and its volume is $1{\cdot}083 \times 10^{27}$ c.c.; hence its average density is about 5·5 grams per cubic centimetre. This is about twice the average density of the surface material, so it is inferred that there exists a large volume of high density material within the earth.

Structure.—From a study of the passage of earthquake waves through the earth and observations of such properties as magnetism, moment of inertia, temperature increase with depth, etc. it is deduced that the earth has a structure consisting of a series of shells. The central *core* has a radius of some 3,600 km. (2,250 miles); it is probably in part liquid, and is almost certainly composed of an alloy of nickel and iron. Separated from the core by a fairly sharp boundary is the *mantle*; this has a thickness of about 2,800 km. (1,750 miles) and is solid. It is probably composed of silicates of iron and magnesium with some metallic iron in the inner region. The outer 100 km. (62·5 miles) is the *crust*, which is solid under ordinary conditions but which may partially liquefy during periods of igneous activity. Under the continents it is possible to distinguish two layers in the crust; an upper, less dense one, probably granitic in character, known as the sial, and a lower, denser one, the sima, probably basaltic in character. The sial appears to be absent under the Pacific Ocean and very thin or absent under the Atlantic and Indian Oceans. The concept of the sial blocks "floating" in the sima provides an explanation for the observed vertical movements of continents and leads to the theory that they may have "drifted", to their present positions. The junction between the sima and the mantle is quite sharp, the break being known as the Mohorovičić Discontinuity. *See* Mohole, Section L.

Composition.—Direct observation of the crust is confined to the surface and mines or boreholes, the deepest of which reach only to about 5 miles. From analyses of the crustal rocks, the abundance of the elements in the crust can be estimated. The commonest is oxygen (46·6%), followed by silicon (27·7%), aluminium (8·13%) and iron (5%). The next four are calcium, sodium, potassium, and magnesium, ranging between 3·6 and 2%. These 8 elements total 97·57% of the whole crust. Most of the other 84 elements are present in amounts to be measured in parts per million; *e.g.*, copper occurs to the extent of 45 p.p.m., tin, 3 p.p.m. These are average proportions over the whole crust; to be workable as ores, concentrations need to be much higher—*e.g.*, both copper and tin ores have to contain a minimum of 1% metal to be economic. Locating the rare occurrences of such concentrations is the job of the prospecting geologist. Taking the earth as a whole, *i.e.*, core, mantle and crust, most authorities agree that the commonest element is iron, followed by oxygen, silicon, and magnesium in that order; after this, there is only partial agreement.

The Age of the Earth.—It is possible to make an estimate of the age of the earth's crust by considering the rate at which radioactive elements break down into inert elements. A number of methods are now available, the most important being those based on the study of the abundances of isotopes of lead and other elements. From the data obtained, estimates can be made of the following points on the time scale: Age of earth's crust about $5{\cdot}3 \times 10^{9}$ years (as a planet the earth has existed for several thousand million years); life emerged about 2×10^{9} years ago; first large-scale occurrence of fossils, 600×10^{6} years ago. Other points on the scale are given in the table on F30 (10^{9} = thousand million; 10^{6} = million).

The Materials of the Earth's Crust.—Geologists recognise three main classes of rocks making up the crust—Igneous, Sedimentary, and Metamorphic. Rocks are aggregates of minerals, which may be regarded as simpler, homogeneous compounds, in contrast to the complex, inhomogenous mixture which is a rock. The bases of rock classification are minerals present, shape and size of the individual grains, and the mode of origin of the material.

Igneous rocks are usually regarded as having crystallised from a molten state, although certain types may have arisen in other ways, *e.g.*, by reaction between high-temperature fluids, of the right composition, and pre-existing rocks. Typical igneous rocks are granite and basalt; granite is coarse-grained, intrusive into other rocks, and contains the minerals quartz, potash or soda felspar, and usually a mica. Basalt is fine-grained, flows out as lava at the surface and contains the minerals augite, calcium felspar, and usually olivine. Between these extreme types are some thousands of intermediates, but together granite and basalt constitute 90–95% of all igneous rocks seen at the surface.

Sedimentary rocks are derived from pre-existing rocks by the processes of weathering and erosion, followed by transport to the point of ultimate deposition of the material, which is then converted from unconsolidated sediment to rock by the process of lithifaction. Typical sedimentary rocks are sandstone, limestone, and shale. Sandstone consists of particles of quartz and occasional other minerals, whereas shales are compacted clays, which may become slate if compressed very strongly during mountain building. Limestones may be chemical precipitates, but are commonly formed by the aggregation of skeletal material of animals. Some other sedimentary types of interest are conglomerates—lithified pebble beds—and evaporites, such as rock salt and gypsum beds. The bulk of the sedimentary rocks were formed under marine conditions.

Metamorphic rocks are produced by the action of heat and/or pressure upon pre-existing rocks, producing considerable changes in mineralogy and texture. Rocks subjected to heat alone are termed hornfelses (marbles if the original rock was a limestone). Pressure alone may produce slates, but often pressure results in shearing forces which crush and break up rocks to a fine powder (subsequently lithified), known as mylonite. Heat and pressure together produce the type of metamorphism known as regional, because it occurs over large areas (*e.g.*, the Scottish Highlands), where it can be seen to have been associated with mountain-building processes. Typical rocks of this kind are schist and gneiss; the former is a foliated rock, usually with much mica, while the latter is a banded rock, with dark and light bands of quartz and/or felspar and mica and/or hornblende. Some gneisses, called migmatites, were produced by the injection of granitic material along the foliation planes of schists.

Mountain Building.—There is no general agreement among geologists about the origin of mountains, despite many years of argument. It is a matter of observation that the great mountain ranges are built of sedimentary rocks—usually much metamorphosed in the deeper levels—and occur in relatively narrow belts of great length. The idea has developed that long, narrow depressions known as *Geosynclines* develop in the crust, into which vast quantities of sediments are poured. The floor is slowly depressed by the weight of material, and ultimately the two sides of the geosyncline move together, folding the sediments both upwards and downwards, producing the complex structures seen in such regions as the Alps and Himalayas. It has been suggested that convection currents in crust, core, or mantle may provide the forces required, but some geologists believe that the earth is contracting and causing the skin to "wrinkle." Another possibility is that the sial blocks move about in the sima, and the Alps, for example, were formed when Africa drove northwards towards Europe. It is suggested that radioactive heating of the sima layers may make them sufficiently mobile to allow movement to take place, and this seems to be an essential feature of most theories of mountain building.

Glaciation.—Within the last million years much the northern part of the Northern Hemisphere as covered by ice-sheets, now reduced to the rctic ice-cap. This has profoundly modified e landscape, especially in mountainous regions ich as the Alps, North Wales, and the Scottish ighlands. The ice, moving first as valley aciers and later as sheets over wide areas, raped off all loose surface material, which was en available to abrade the bare rocks to give e characteristic scenery. In Britain the maxi- um advance of the ice-sheets brought them to e line Bristol Channel–Thames Estuary, passing st north of London. The great heaps of débris ansported by the glaciers are known as moraines. ne cause of the ice age is not fully understood, ut it is worth noting that in the Permo-Carboni- rous period in the Southern Hemisphere there as a widespread glaciation at the same time as e coal measures and desert sediments were being id down in the Northern Hemisphere. Other aciations are known from several other epochs far back as 2×10^9 years.

The Oceans.—The oceans cover 75% of the rth's surface. They may be divided into three ain types of environment—the *shelf seas*, ordering the continents, the *continental slopes*, ansitional between the shelves and the *abyssal gion*. Each region has its own type of sedi- entation, fauna, and flora. Because of the rtual absence of a sial layer under the oceans, e study of the ocean floor yields special informa- on about the sima and mantle, and may provide ta leading to a solution of current problems lating to geosynclines and mountain building. udy of sedimentation in the oceans is important r understanding the ancient sedimentary rocks.

The Atmosphere.—The atmosphere at sea-level ntains about 78·1% nitrogen and 21% oxygen, e remainder being carbon dioxide (0·03%) and e inert gases. It is thought that in the early ages of the earth's history much more carbon oxide existed and less oxygen. When plants veloped, the carbon dioxide was utilised in e building up of food substances with the ease of oxygen in the process of photosynthesis 29).

The International Geophysical Year, 1957–58.— ne results of the IGY observations are still ing analysed and discussed in order to exhaust eir scientific content. It is certain that almost the principal investigations in geophysics ring the next half century and almost all the vances in our knowledge of the earth and of the rces acting upon it will be based upon the global ta accumulated during the IGY. The oceans the world have been so incompletely studied d present so many problems, many of which uld not be investigated during the IGY, that rther observations are to continue over a period years, and a comprehensive programme of servations in the marine sciences has been anned.

THE WORLD OF PHYSICS.

Anyone compelled by curiosity or professional erest to look into contemporary journals of re physics research is soon struck by the fact at the old text-book division of physics into heat, light, sound, electricity, and magnetism" s become very blurred. The indispensable riodical of research summaries, *Physics Ab- acts*, contains about 450 entries a month, under ty separate headings. This is very daunting en to the experienced physicist and, as a token the human effort devoted to one single branch science, it is impressive for variety, for degree specialisation, and for sheer volume. How n the main features of this great work be esented to the non-specialist?

Two different, though complementary, sec- ns can be distinguished. First, there is the ysics concerned with the properties of matter bulk, with solids, liquids, and gases, and with ose odd but very important substances, such paints, plastic solutions, and jelly-like material, ich are neither properly solid nor liquid. In this vast domain of physics questions like this are asked: Why is iron magnetic, copper not? What happens when solids melt? Why do some liquids flow more easily than others? Why do some things conduct electricity well, others badly, some not at all? During the last century, particularly the last few decades, it has become clear that such questions can be answered only by raising and solving others first. In particular, we must ask: (i) Of what nature are the invisible particles of which matter is composed? and (ii) How are those particles arranged in bulk matter?

The first of these two questions has generated the second major category of modern physics: this is the physics of particles and of the forces that particles exert on each other. In this field, which represents science at its most fundamental, questions like this are asked: If matter is composed of small units or particles, what are they like? How many kinds of particle are there? Do the particles possess mass? electric charge? magnetism? How do the particles influence each other? How can their motion be described and predicted?

Once scientists became convinced that matter did indeed consist of particles, the *arrangement* of the particles in matter became an important question. This is the problem of *structure*. It was discovered, by von Laue in Germany and by W. H. and W. L. Bragg in England, that the structure of solids could be inferred from the way X-rays are reflected. It is well known that X-rays can penetrate solids. In doing so, they encounter successive layers of particles and are reflected from them. The reflections reveal how far apart the layers are and how the particles are arranged in space. This is the technique of X-ray crystallography. By now it has shown that most solid matter is *crystalline*, *i.e.*, it consists of a regular pattern of particles repeated over and over again to fill the volume of the solid—just as a wallpaper is covered by repeated units of design. The units in a crystal are very small, often about 10^{-8} cm. across, and the particles in them are very close together.

Liquids, on the other hand, have no repeated pattern, but consist of particles which are jumbled up, though still very closely packed—like marbles in a bag. In gases, the particles are widely separated and moving rapidly about; the average distance between particles in air is about 10 times that in ordinary solids, and air particles have an average speed of 5×10^4 cm. per sec. (1,000 m.p.h.).

In general, therefore, the structure of matter is fairly well understood. This does not mean that structure studies are out of date, but only that now they are devoted to elucidating the structure of particular substances, often extremely complex ones such as are found in living matter. We shall therefore say no more about structure, but turn to the major divisions of physics introduced above: (i) particles and their forces; (ii) the properties of matter in bulk.

I. PARTICLES AND FORCES.

The idea that matter is composed of small particles, or atoms, originated, it is true, in classical times. Nevertheless, the modern views need be traced back no farther than the beginning of the nineteenth century, when Dalton and his contemporaries were studying the laws of chemical combination. By that time the distinctions between elements, compounds, and mixtures were already made. Compounds and mixtures are substances which can be separated into smaller amounts of chemically distinguishable constituents. Elements (*see* N34) cannot be so divided. In a mixture the components may be mixed in any proportion and sorted out again by non-chemical means. In a compound the elements are combined in fixed proportions by weight. This last fact gives the clue to atomic theory.

Dalton and atomic theory.

Dalton pointed out that the fixed combining weights of elements could easily be explained if the elements consisted of atoms which combined in simple numerical ratios, *e.g.*, 1 atom of element A with one of B, or one of B with two of C, and so on. For instance, 35·5 gm. of chlorine combine with 23·0 gm. of sodium to make 58·5 gm. of ordinary salt. If we assume one atom of chlorine links with one of sodium, then the atoms themselves must have weights in the ratio 35·5 to 23·0. This turns out to be consistent with the combining weights of chlorine and sodium in all other compounds in which they both take part. Sometimes two elements combine in several different proportions by weight. But this is easily explained by assuming that the atoms link up in different numbers, *e.g.*, one iron atom with one oxygen, or two irons with three oxygens, or three irons with four oxygens. Then the three different combining proportions arise from the three different numbers of atoms, *using in each case the same ratio of oxygen atom weight to iron atom weight.*

Atomic weight.

Over the century and a half since Dalton, these ideas have been repeatedly tested by chemical experiments. No one now doubts that every chemical element has atoms of characteristic weight. By convention the number 12·0000 is ascribed to carbon and called its "atomic weight." The atomic weights of other atoms are expressed by giving their ratio to that of carbon, *e.g.*, hydrogen, 1·008; iron, 55·85. These numbers are only ratios; the real weight of one single oxygen atom is $2{\cdot}7 \times 10^{-23}$ gm.

J. J. Thomson and the electron.

Matter is electrically uncharged in its normal state, but there exist many well-known ways of producing electric charges and currents—rubbing amber, or rotating dynamos, for example. It is therefore necessary to have some theory of electricity linked to the theory of matter. The fundamental experiment in this field was made by J. J. Thomson when, in 1897, he discovered the electron.

If you take two metal electrodes sealed inside a glass vessel, and if the air is suitably pumped out and a high voltage applied to the electrodes, then the negative one emits a radiation which causes the walls of the tube to glow. The rays are called *cathode rays.* The discovery of the electron was essentially a clarification of the nature of cathode rays. Thomson showed that they were streams of particles with mass and negative electric charge and a general behaviour unlike any other atomic particle known at that time. The importance of this discovery for the world of science cannot be overestimated, and its technical progeny are in every home and factory in radio valves, television tubes, and other devices.

Rutherford–Bohr atom.

Since the electrons emerge from matter, they are presumably parts of atoms. The relation between the negative electrons and the positively charged constituents of matter was elucidated by the great experimenter Rutherford and the great theoretician Bohr. Their work, just before the First World War, showed that the positive charge, together with almost all the mass, is concentrated in the central core or nucleus of the atom about which the very light-weight electrons revolve. The diameter of an atom is about 10^{-8} cm., roughly one-three hundred millionth part of an inch. The central nucleus has a diameter about 10,000 times smaller still. The nucleus and the electrons hold together because of the electric attraction between them.

At this stage work could, and did, go on separately along several different lines:

(i) Electrons could be studied on their own. Nowadays the handling of beams of electrons of all sizes and intensities has become a major industry.

(ii) The nucleus could be treated as a special problem, and this led to the mid-century flowering of nuclear physics, to the atomic bomb, and to nuclear power.

(iii) The behaviour of electrons in the atom could be analysed; this is the great domain of atomic physics which spreads into many other sciences as well.

Volumes have been written about each of these three fields, but we can spare only a few lines for each.

The Electron.

Electrons are expelled from solids by light, heat, electric fields, and other influences. It has therefore been possible to study beams of electrons on their own *in vacuo.* Electrons inside matter, either as constituents, or temporarily in transit, can also be observed by their innumerable effects. These observations all show the particles to be indistinguishable one from another; all electrons are the same wherever they come from. They have a definite mass ($9{\cdot}11 \times 10^{-28}$ gm.), a negative electric charge, a magnetic moment, and a "spin" (intrinsic rotatory motion). No one has ever subdivided an electron or obtained an electric charge smaller than that on one electron. The electronic charge is therefore used as a basic unit of charge in atomic physics. The electron has come to be the best known of all the "fundamental particles."

The Nucleus.

The early research programmes in nuclear physics were greatly facilitated by the occurrence in nature of certain unstable (radioactive) nuclei which emit fast-moving fragments. The latter can be used as projectiles to aim at other nuclei as targets; the resulting impacts yield much valuable information. This technique still dominates nuclear physics, though nowadays the projectiles are artificially accelerated by one or other of the large costly machines designed for the purpose.

The most important early discovery was that the nucleus consists of two types of fundamental particle—the positively charged *proton* and the electrically neutral *neutron.* These two are of nearly equal mass (about 1,800 times that of the electron), and like electrons, have a magnetic moment and spin. The proton charge is equal to the electron charge, though opposite in sign. Consider a moderately complex nucleus like that of iron. This usually has 30 neutrons and 26 protons. Its atomic weight therefore depends on the total number of neutrons plus protons, but the total charge depends only on the number of protons—called the *atomic number.* The latter is denoted by *Z* while the total number of neutrons plus protons is called *mass number* and denoted by *M*. *Z* is also the number of electrons in the atom since the atom as a whole is electrically neutral The atomic number determines the chemical nature of the atom (see below), so that by altering the number of *neutrons* in a nucleus we do not change the chemical species. It is therefore possible to find—and nowadays to make—nucle of the same element which nevertheless differ slightly in weight because they have different numbers of neutrons. These are called *isotopes* Iron isotopes are known with 26, 27, 28, 29, 30, 31 32, and 33 neutrons, but all have 26 protons Only those with 28, 30, and 31, and 32 neutrons occur naturally; the rest have been made.

Stable Isotopes.

The protons and neutrons in a nucleus are bound together by strong forces called *nuclea forces.* In many cases, the forces are so strong that no particles ever escape and the nucleus preserves its identity. There are two hundred and eighty-four different combinations of neutrons and protons of this kind, and they are called the *stable isotopes.* The earth is largely composed of such stable isotopes, because any unstable ones have, in the course of time, spontaneously broken up into stable residues.

Nevertheless, there are some unstable nucle left on earth. They give rise to the phenomenon of radioactivity which was discovered by Becquerel in 1893.

Unstable Isotopes: Radioactivity.

Becquerel found that certain chemicals containing uranium gave off rays capable of blacken g a photographic plate, and shortly afterwards arie and Pierre Curie discovered more sub- ances, including radium, which produce similar it stronger effects. By now, about fifty chemical ements having radioactive properties are known exist on earth, some, like radium, being strongly dioactive, others, like potassium, being so weak at the radiations are difficult to detect. These e called the *natural radioactive isotopes*.

The main facts about radioactivity are as llows: it is a *nuclear* phenomenon and (with inor exceptions) proceeds quite independently of natever the electrons in the atom may be doing. nus, the radioactivity of an atom is not affected the chemical combination of the atom with her atoms, nor by ordinary physical influences e temperature and pressure. The radioactivity nsists of the emission by the substance of certain nds of rays. The early workers, Rutherford ing the giant among them, distinguished three nds of rays labelled α, β, and γ. These are scribed below. Whatever kind of ray is ex- nined, it is found that the radiation from a given mple decreases gradually with time according a definite law which states that the intensity of diation decreases by half every T seconds. e number T, called the half-life, is constant for ch radioactive material, but varies enormously om substance to substance. For instance, dium decreases its activity by a half every 522 years, whereas the half-life of one of the lonium isotopes is about $0{\cdot}3 \times 10^{-6}$ sec.

β-, and γ-rays.

The three most well-known types of radioactive nission are quite distinct from one another.

(i) α-rays or α-particles consist of two protons d two neutrons bound together. They are ected from the radioactive nucleus with one of veral well-defined speeds. These speeds are gh, often of the order 10^9 cm. per sec. Two otons and two neutrons are the constituents of e nucleus of helium, and α-particles are thus t-moving helium nuclei.

(ii) β-rays are moving electrons. They may nerge from their parent nucleus with any speed om zero to a definite maximum. The maximum eed often approaches that of light, and is ferent for each isotope. The electron has a sitively charged counterpart, the positron (see low), and β-rays are sometimes positrons. To tinguish the two cases, the symbols β^- and β^+ used. The naturally occurring β-radiations almost all β^-.

(iii) γ-rays travel with the speed of light be- use they are in fact electromagnetic waves fering from light only in the extreme shortness their wavelength. They have no electric arge.

It is unusual, though not unheard of, for the ne radioactive substance to emit both α- and ays. On the other hand, γ-rays frequently company either α- or β-rays.

γ-rays pass through matter easily; in fact, they extra penetrating X-rays. α-rays can be pped by thin sheets of tissue paper. α-rays ought to rest pick up a pair of electrons from surrounding matter and become neutral ium atoms, and helium gas from this source is nsequently found imprisoned in certain radio- ive rocks. β-rays are intermediate in pene- ting power between α- and γ-rays.

We must now try to interpret these observa- ns.

dioactive Disintegration.

A nucleus is a collection of neutrons and protons eracting with each other and possessing collec- ely a certain amount of energy. Just as some nan organisations lose their coherence if they ept too many members, so nuclei can remain ble only if (i) the total number of particles is too great, and (ii) neutrons and protons are re in suitable proportions. Radioactive nuclei the ones for which either or both these condi- ns do not hold. Sooner or later such nuclei ct a fragment, thus getting rid of some energy y cannot contain. This is called a *radioactive integration*, and the fragments are the α-, β-, γ-rays. α-emission relieves a nucleus of two trons and two protons and some energy; γ-emission simply carries off excess energy without altering the number or kind of particles left behind. β-emission is more complicated. There are no electrons normally present in a nucleus, but they are suddenly created and explosively emitted if a neutron changes into a proton; positive electrons are similarly generated if a proton changes into a neutron. β-emission is therefore a mechanism for changing the ratio of protons to neutrons without altering the total number of particles.

Both α- and β-emission change the Z of a nucleus, and the product, or daughter nucleus, is a different chemical element. α-emission also changes the M. It might happen that the daughter nucleus is unstable, in which case it too will disintegrate. Successive generations are produced until a stable one is reached. Part of such a family tree is shown below. The symbols above the arrows show the kind of rays emitted at each stage, the figures are the mass numbers, M, and the names and symbols of chemical elements can be found on N28.

$$\mathrm{U}^{238} \xrightarrow{\alpha} \mathrm{Th}^{234} \xrightarrow{\beta} \mathrm{Pa}^{234} \xrightarrow{\beta} \mathrm{U}^{234} \xrightarrow{\alpha} \mathrm{Th}^{230} \xrightarrow{\alpha}$$
$$\mathrm{Ra}^{226} \xrightarrow{\alpha} \mathrm{Rn}^{222} \xrightarrow{\alpha} \mathrm{Po}^{218} \xrightarrow{\alpha} \mathrm{Pb}^{214} \xrightarrow{\beta} \mathrm{Bi}^{214} \xrightarrow{\beta}$$
$$\mathrm{Po}^{214} \xrightarrow{\alpha} \mathrm{Pb}^{210} \xrightarrow{\beta} \mathrm{Bi}^{210} \xrightarrow{\beta} \mathrm{Po}^{210} \xrightarrow{\alpha} \mathrm{Pb}^{206}$$

(Pb^{206} is stable lead).

This family exists naturally on earth, because the head of the family, U^{238}, has so long a half-life ($4{\cdot}5 \times 10^9$ years) that there has not yet been time enough since its formation for it to have disappeared.

Artificial Radioactivity.

Nowadays many new radioactive isotopes can be man-made. All that is required is to alter the M or Z (or both) of a stable isotope to a value which is incompatible with stability. The means for doing this is *bombardment*, *i.e.*, stable nuclei are exposed to the impacts of atomic particles such as streams of protons from an accelerator, the neutrons in an atomic reactor, or simply the α-particles from another radioactive substance. The new material is called an *artificially radioactive isotope*. Artificial radioactivity is not different in kind from that of the naturally radioactive substances, but the half-lives are usually on the short side. Indeed, the isotopes in question would exist in nature but for the fact that their short half-lives ensured their disappearance from the earth long ago.

Suppose a piece of copper is exposed to the intense neutron radiation in an atomic reactor at Harwell.

The more abundant of the two stable isotopes of ordinary copper has thirty-four neutrons and twenty-nine protons (*i.e.*, $Z = 29$, $M = 63$). In the reactor many (not all) of these nuclei absorb a neutron, giving an unstable copper nucleus with $Z = 29$, $M = 64$. When removed from the reactor the specimen is observed to be radioactive with a half-life of 12·8 hours. It is somewhat unusual in that it gives out both β^- and β^+ rays. Some nuclei emit electrons, leaving a daughter nucleus with one more positive charge than copper, *i.e.*, a zinc nucleus ($Z = 30$, $M = 64$). One neutron has become a proton, and the resulting zinc nucleus is stable. The others emit positrons, leaving behind a nucleus in which a proton has been turned into a neutron ($Z = 28$, $M = 64$); this is a stable nickel nucleus. The overall process is one example of the artificial transmutation of the chemical elements which is now a commonplace of nuclear physics. It was first discovered by Irene and Frederick Joliot-Curie in 1934.

Lack of a Complete Theory.

Consider now a collection of, say, one million radioactive nuclei of the same kind. It is impossible to tell exactly when any one of them will disintegrate; it is a matter of chance which ones break up first. All we know is that, after a time equal to the half-life, only a half a million will survive unchanged. In general, the more excess energy a nucleus has, the more likely it is to break up, and therefore the shorter the half-life of that particular nuclear species. In principle, to calculate the half-life theoretically, one would have to have a reliable theory of nuclear forces and energies. This is still being sought after, so it is probably fair to say that while the laws of behaviour of radioactive isotopes are well and accurately known, the *explanation* of this behaviour in terms of the properties of protons and neutrons is by no means complete.

Nuclear fission—chain reaction.

A discovery important not just for nuclear physics but for the whole of mankind was made by Hahn and Strassman in 1939. This was the discovery of nuclear fission in uranium. One of the natural isotopes of uranium is an unstable one, U^{235}, with 143 neutrons and 92 protons. It normally shows its instability by emitting α- and γ-rays. If uranium is bombarded with neutrons, some U^{235} nuclei temporarily gain an extra neutron, which makes them even less stable. This they show by splitting into two roughly equal parts, called fission fragments, together with two or three neutrons. There are two highly important things about this disintegration. One is that the two or three neutrons can promote further disintegrations in other uranium nuclei, and the process can therefore be self-propagating; it is then called a *chain reaction.* The other is that the total mass of the fission products is less than that of the original nucleus. This mass difference does not disappear without trace; it turns into energy according to a formula referred to in a paragraph below (**F15(1)**).

Application of these new forces.

The world has found two uses for the energy liberated in nuclear chain reactions: the atomic bomb and nuclear power plants. In the first, conditions are arranged to promote and encourage a tremendous and rapid chain reaction leading to an explosion; in the second, the steady liberation of energy in the form of heat is controlled for use in turbines which can generate electricity or provide propulsion. Both uses represent epoch-making technical achievements, but mankind has yet to show itself capable of bearing sanely the burden of responsibility which nuclear physicists have laid upon it. One thing is certain: the discoveries will not cease. Already, other fissionable elements have been made and used; new chemical elements have been created; nuclear plants (" atomic piles ") have stimulated great demands for new materials that will stand the heat and radiation inside the reactor, and this promotes research in other fields of science; irradiation inside an atomic pile gives new and potentially useful properties to old materials; nuclear power drives ships and aircraft. It is difficult to write even briefly about contemporary nuclear physics without feeling keenly the ambiguity of its powerful promises.

Although so much is known about the behaviour of nuclei, the theory of the nucleus leaves much to be desired. What holds the neutrons and protons together? Why are some nuclei more stable than others? It is certain that the forces between neutrons and protons in a nucleus are unlike the electrical attractions between the nucleus as a whole and its surrounding electrons. Nor have they anything to do with gravitation. Indeed, the best description and explanation of nuclear forces is the objective of much of the contemporary research effort in nuclear physics.

Atoms.

A nucleus surrounded by its full complement of electrons is an electrically neutral system called an atom. Neither the atom as a whole, nor its nucleus, counts as a " fundamental particle " because either can be subdivided into more elementary parts, thus:

$$\text{atom} \longrightarrow \text{electrons} + \text{nucleus} \longrightarrow \text{electrons} + \text{neutrons} + \text{protons}$$

The chemical identity of the atoms of a given element, which was Dalton's key idea, depends entirely on the number and motion of the electrons. For example, the simplest element, hydrogen, has one proton for a nucleus, and one electron. The latter is comparatively easily detached or disturbed by the electric forces exerted by neighbouring atoms, consequently hydrogen is reactive chemically, *i.e.*, it readily lends its electron to build chemical structures with other equally co-operative elements. The second element, helium, has a nucleus of two protons and two neutrons; outside are two electrons in a particularly stable arrangement. Indeed, this pair of electrons is so difficult to disarrange that a special name has been coined to cover such cases—*closed shells.* Helium, with its closed shell, will not react chemically with anything. As the nuclear charge increases, different electron arrangements of greater or lesser stability succeed one another, with every so often a closed shell corresponding to one of the chemically inert gases neon, argon, xenon, krypton.

Such considerations, pursued in sufficient detail, enable atomic physics to account for all the differences and similarities among the chemical elements and, in principle at least, for the other facts of chemistry as well.

Ions.

It is possible to remove one or more electrons from an atom, leaving it positively charged. The atom is then said to be *ionised* and is called a *positive ion.* Alternatively, some atoms are capable of accepting electrons above their normal complement, thus becoming negative ions. The behaviour of ions is very important in many fields of physics and chemistry, and some of these will be referred to later.

Molecules.

Electrical attractions of various kinds cause atoms and ions to form compound groups. This is the basis of chemical combination, and the smallest conceivable fragment of compound which still preserves the chemical identity of that compound is called a molecule. Molecules have a wide range of complexity, from simple pairs of atoms to highly intricate spirals and chains composed of thousands of atoms.

Excited atoms.

Like the nuclei described above, atoms can be given excess energy and will then return to their ground state with the emission of radiation. The excess energy usually resides in one of the electrons which is executing unusually violent motion. The electron returns to normal by releasing its excess energy in the form of light whose colour is characteristic of the atom involved Herein lies the explanation of innumerable natural and technical phenomena, such as the colours of glowing gases whether they exist in the sun and stars, in auroræ, or in street-lamps and neon signs. Herein also lies the reason for the importance of spectroscopy, which is the study of the characteristic radiation from excited atoms for spectroscopy is not only a useful tool for the chemical identification of elements (" spectroscopic analysis ") but was one of the main routes along which twentieth-century physicists broke through to a knowledge of the inner nature of the atom.

Fields and Waves.

Maxwell and electromagnetic waves.

Atoms are held together by the electric attraction of the nucleus for the electrons. Finer details of atomic behaviour depend on the magnetic moments of the particles. Any region of space subject to electric and magnetic influences is called an *electromagnetic field.* Before the discovery of the electron, Maxwell had perfected a general theory of the electromagnetic field giving to physics a celebrated set of equations which describe satisfactorily almost all electri and magnetic phenomena. *Inter alia*, he proved that disturbances in the electric and magneti conditions at one place could be propagated t another place through empty space, with definite velocity, just as sound waves are propagated through air. Such electromagnetic disturbances in transit are called *electromagnetic waves* and their velocity turned out experimentally t the same as that of light and radio waves— ich was a decisive argument to show that both these phenomena are themselves electro- gnetic waves.

nstein and photons.

In the years between about 1900 and 1920 this w was upset by Planck, Einstein, Millikan, d others, who focused attention on phenomena diant heat, photoelectricity) in which light haves like a stream of particles and not at all e waves. A wave and a particle are two quite ferent things, as anyone will admit after a ment's contemplation of, say, the ripples on a nd and a floating tennis ball. The acute estion was: is light like waves or particles? is celebrated dilemma soon multiplied its horns. 1927 electrons were shown to be quite capable of having as waves instead of particles, and this now known to be true of protons, neutrons, and other fundamental particles as well.

Theoretical physicists have devised means of ving it both ways. To say that light behaves particles means that the waves of the electro- gnetic field cannot have their energy sub- ided indefinitely. For waves of a given quency, there is a certain irreducible quantity energy that must be involved whenever light eracts with anything. This quantity is the oduct $h\nu$, where ν is the frequency and h is a nstant named after Planck. Each such unit called a *quantum of the electromagnetic field* or a *oton* and is counted as one of the fundamental ticles. Frequencies and wavelengths vary dely; typical wavelengths are: radio—hun- ds or thousands of metres; radar—a few timetres; visible light—5×10^{-5} cm.; X- s—10^{-8} cm.

It is now accepted that every fundamental ticle is a manifestation of the waves of one or er kind of field. Physicists speak of waves, ticles, and fields in the same breath or rather same equation. Little is to be gained by ing if electrons or photons are "really" ticles or waves. All one can say is that they things whose behaviour is predicted and cribed by certain equations. Those who must ualise can imagine particles in some phenomena waves in others: neither conception contains whole truth. Why should the ultimate isible constituents of matter be forced into one other category derived from everyday experi- e? For convenience, however, we shall continue call these things "fundamental particles."

antum Theory.

The point of view of the last paragraph is racteristic of quantum theory, which is the rently accepted fundamental theory of matter motion. One can reasonably ask at what ition in space, exactly, is a particle? Or, what, ctly, is the wavelength of a wave? But the question cannot be reasonably asked of a ve, nor the second of a particle. Since elec- ns have something in common with both, one stion cannot be answered precisely for trons without ignoring the other; alterna- ly, both questions can be given an imprecise wer. As the wavelength of electrons is mately connected with their speed, one has accept an accurate knowledge of the speed velength) and ignorance of position, or the verse, or *inaccurate* knowledge of both. This he famous Heisenberg Uncertainty Principle. ntum theory is a set of mathematical rules calculating the behaviour of fundamental ticles in accordance with the Uncertainty nciple. In spite of its equivocal-sounding e, the principle has led to an enormous ease in the accuracy with which physical nomena can be described and predicted. ntum theory includes all that previous ories did and more.

uantum theory grew up in the same epoch as Theory of Relativity. Heroic attempts have made to combine the two, but with only ial success so far. Relativity is concerned all motion and all physical laws, but its racteristic manifestations occur only when ething is moving with nearly the velocity of t. Quantum theory is likewise all-embracing, its typical phenomena almost always occur when something on the minute atomic scale is in question. Consequently, the vast majority of everyday mechanics needs no more than the classical theory laid down by Newton, which is neither relativistic nor quantum.

Relativity.

Historically, relativity grew out of attempts to measure the speed with which the earth moved through that hypothetical medium, called the ether, which was supposed at that time to be the bearer of light waves. To take a simple analogy: sound waves travel through still air with a certain definite speed, v. If you move through the air with speed v' towards oncoming sound waves, they will pass you at the speed $v + v'$. Michelson and Morley, in their celebrated experiment of 1887, failed to find the corresponding behaviour on the part of light. This is so important an experiment that it has been repeated, and repeatedly discussed, ever since. In October 1958 the latest and most accurate confirmation of the Michelson–Morley result was announced. It seems as if light always travels with the same speed relative to an observer, however fast he moves relative to anything else. Einstein put it this way: two observers moving with any constant velocity relative to each other will always agree that light travels past them at the same speed; this speed is denoted by c, and is approximately 186,000 miles per second.

This postulate, logically developed, leads to remarkable conclusions. For instance: if you walk from tail to nose of an aircraft at 4 m.p.h. and the plane is receding from me at 300 m.p.h., then you recede from me at 304 m.p.h. "Common sense," Newton, and Einstein would all agree on this. But if you could walk at $0{\cdot}25c$ and the plane moved at $0{\cdot}5c$, the Newtonian mechanics would give your recession speed as $0{\cdot}75c$, whereas Einsteinian relativity would give about $0{\cdot}71c$. Although at the everyday speed of 300 m.p.h., the disagreement, though present in principle, is absolutely negligible, at speeds near that of light it becomes very pronounced. Many experiments show that the relativity answer is right.

Equivalence of mass and energy.

Another famous consequence of relativity is the equation $E = mc^2$, connecting energy, E, with mass, m. c is so great that when mass is converted to energy a small mass gives a large energy. The grim demonstration of this was given to the world at Hiroshima; a more hopeful one at Calder Hall. The life-giving energy of the sun is derived from nuclear processes which consume mass and deliver energy according to this equation.

Mass and rest mass.

"Mass" is far from being a simple notion. The only complication we shall note here is that the mass of a body is not necessarily constant. A stationary body can be observed to have a mass called its *rest mass*. If the body moves, it has energy of motion and therefore, according to Einstein's mass–energy equation, it increases its mass. Mass thus depends on speed, but in such a way that there is very little change unless the speed approaches that of light. Many experiments on atomic particles demonstrate this. The interesting question now arises: do all fundamental particles have rest mass? or do some have mass derived solely from their energy? The answer appears to be that photons and neutrinos have no rest mass; all other particles have. The Table on **F14** gives their rest masses.

Special theory of relativity.

The mathematical development of Einstein's ideas, leading to the conclusions just referred to, constitutes the Special Theory of Relativity. Stated more generally, the theory raises the question whether two observers in uniform relative motion could ever detect, as a result of their relative speed, any difference in the physical laws governing matter, motion, and light. To this, Special Relativity answers: No. The detailed theory involves special consideration of the results the two observers would obtain when measuring (i) the spatial distance, and (ii) the time interval, between the same two events. It turns out that they would not agree on these two points. They would agree, however, on the value of a certain quantity made up jointly of the spatial distance and the time interval in a somewhat complex combination. The intimate mixture of space and time in this quantity has led to the treatment of the three space dimensions and time on an equivalent footing. Hence the frequent references to time as the "fourth dimension." Minkowski devised an extremely elegant presentation of relativity theory by using an extension of ordinary geometry to four dimensions. A line drawn in his four-dimensional space represents the path of a particle in space and time, *i.e.*, the whole history of the particle. Thus the movement of particles in the ordinary world is turned into the geometry of lines in Minkowski's four-dimensional world of "space-time."

SOME MEMBERS OF THE ATOMIC FAMILY

The numbers in brackets after the name denote first the electric charge and second, the mass. The charge on an electron is counted as −1 unit and the electron mass as +1 unit. Thus (+1, 207) means the particle has a positive charge of 1 unit and a mass 207 times that of the electron.

Photon (0, 0)	A quantum of electromagnetic radiation, *e.g.*, light, X-rays, γ-rays. The concept was introduced by M. Planck in 1900 when he described the emission of light as taking place in "packets" rather than in a steady stream. The energy of a photon is proportional to the frequency of the radiation and inversely proportional to the wavelength.
	Leptons
Electron (−1, 1)	Discovered by J. J. Thomson in 1897. The number of orbital electrons in an atom determines its chemical properties. Actual rest mass = $9{\cdot}1 \times 10^{-28}$ gm. Emitted as β-rays by some radioactive nuclei. A stable particle.
Positron (+1, 1)	Positive counterpart or, "anti-particle," to the electron. Predicted theoretically by P. A. M. Dirac in 1928 and first discovered in cosmic rays by C. D. Anderson in 1932. Emitted as β-rays by some radioactive nuclei. When positrons and electrons collide they usually annihilate each other and turn into γ-rays; consequently, positrons only last about 10^{-10} sec. within ordinary matter, but are stable in isolation.
Neutrino (0, 0) and Anti-neutrino (0, 0)	These particles travel with the speed of light and are distinguished from one another by the relation of their spin to their direction of motion. A neutrino is emitted with the positron during positive β-decay; and an anti-neutrino with the electron during negative β-decay. Their interaction with matter is extremely slight. First postulated by Pauli in 1933 and detected in 1956. π-meson decay also produces neutrinos and anti-neutrinos but in 1962 it was proved experimentally that these are a different species. Thus there are two kinds of neutrino each with an anti-neutrino. All these particles are distinguished from photons by having different spin.
Muon (±1, 207)	Similar to, but heavier than, the electron and positron; disintegrates into electron (or positron if positive) +neutrino +anti-neutrino.
	Mesons
Pion (±1, 273) or (0, 264)	The π-meson. Charged pions decay either into muons and neutrinos or into electrons and neutrinos. Neutral pions decay into γ-rays, into "positron-electron pairs," or both. Pions are intimately connected with nuclear forces, *i.e.*, with the "strong" interaction.
Kaon (±1, 967) or (0, 974)	The K-mesons. These decay in many different ways producing other mesons, electrons, and neutrinos.
	Baryons
Proton (+1, 1836·1)	The positively-charged constituent of nuclei; the hydrogen nucleus is one proton. Fast-moving protons occur in cosmic rays. Does not spontaneously disintegrate.
Anti-proton (−1, 1836·1)	Negative anti-particle of the proton. Its existence was long suspected. Artificially produced and detected for the first time in 1955. Will react with the proton to produce pions or kaons.
Neutron (0, 1838·6)	Discovered by J. Chadwick in 1932. The neutral constituent of nuclei. When free it spontaneously disintegrates into a proton, an electron, and an anti-neutrino, after an average lifetime of about 18 minutes. Passes through matter much more easily than charged particles.
Anti-neutron (0, 1838·6)	The anti-particle of the neutron from which it is distinguished by properties connected with its magnetic moment and spin. Will react with neutron to produce pions or kaons.
Lambda Particle (0, 2183)	Discovered in 1947. Decays into proton plus pion.
Sigma Particle (0 or ±1; about 2330)	Various modes of disintegration, producing neutrons, protons, mesons and lambda particles.
Omega Minus (−1, 3270)	Predicted by recent theory and discovered at Brookhaven, New York, in 1964. Still under intensive study.

avitation.

neral theory of relativity.

The apparently innocuous extension of the eceding ideas to include observers in accelerated ative motion opened up new fields of mathe- atical complexity, but enabled Einstein to bring avitation into the argument. In speaking of oms and particles we have not yet mentioned avity. This is because the electrical and agnetic forces acting between the particles nstituting matter are much stronger than the avitational; gravity need not enter atomic eory at all. But in the discussion of astronomi- l problems and the movements of large-scale, ctrically uncharged bodies, it has been usual, er since Newton, to say that two bodies of ass m_1 and m_2, separated by a distance r, ract one another with a force proportional to m_2/r^2. This is Newton's inverse square law of avitation. With this, Newton explained the ovements of planets and comets and the falling earth of the apple from his tree.

The apple's fall is accelerated, and we observe s by noting its position relative to certain rks fixed with respect to us, and by timing with some sort of clock. This system of ation in space and time may be called our rame of reference." We therefore assert that, our frame of reference, the apple falls down h an acceleration which Newton saw no ernative but to attribute to a thing called avitational attraction. Galileo had shown t *all* bodies fall with the same acceleration at points, and we can now rephrase this by ing that in our frame of reference there is a nstant gravitational attraction or *uniform vitational field*. (This last statement and lileo's demonstration only refer strictly to nts fairly near the earth's surface; at greater tances the gravitational field decreases and herefore not uniform.)

Now suppose a collection of falling bodies is served by an intelligent creature, designated *C*, o inhabits one of them. *C* has his own frame reference fixed relative to him. In *C*'s frame ther his own body, nor any of the others, is elerated, and therefore he has no reason to pose a gravitational force is acting on them. have, therefore, the following situation:

(i) in our frame, fixed relative to us, we find all the bodies falling subject to a gravitational pull;

(ii) in *C*'s frame, undergoing accelerated fall relative to us, no gravitational field is apparent.

t looks, therefore, as if one has only to choose correct frame of reference for the measure- nts in order to remove the need for any umptions about the existence of gravitational ds. This is a simple illustration of the connec- n between gravitation and frames of reference the measurement of space and time. Ein- in's General Theory of Relativity extends to cover non-uniform gravitational fields and ws that what Newton taught us to call the vitational field of material bodies is better ught of as a peculiarity of the space and time the neighbourhood of such bodies. Since ce–time, as we mentioned above, can be ressed in geometrical terms, Einstein has nsformed the theory of gravitation into an rcise (a difficult one) in the geometry of space– e. Other physicists, in Einstein's tradition, trying to turn *all* physics into geometry, but one knows whether this is really feasible.

ll this abstruse work is much more than a nonstration of mathematical power and gance. Observable phenomena which fall side the scope of Newton's theory of gravita- are accounted for by relativity. One is small but definite discrepancy between the ual orbit of the planet Mercury and the dictions of Newton's theory. Another is bending of stellar light rays as they pass close he sun, an effect which results in the apparent lacement of the position of the star. A third he effect of a gravitational field on the wave- th of light emitted by atoms. Similar atoms ifferent places in a gravitational field emit radiations with slightly different wavelengths. For example, the light from an atom in the intense field of a star should have slightly longer wavelength than the corresponding light from an atom on earth. This effect has always proved very difficult to detect with certainty. However, Einstein's prediction was verified with moderate accuracy in 1960 by a very subtle method which was purely terrestrial in its operation. The atoms being compared were placed at the top and bottom of a water tower and the difference in their emission was detected by means that belong rather to nuclear physics than to astronomy.

Particles.

Nature seems to use four different kinds of force to make one particle interact with another. The weakest force is gravity; while this dominates celestial mechanics its effect inside atoms is negligible compared with the other three. The binding forces inside atoms are *electromagnetic*, *e.g.*, the attraction of nuclei for electrons. Considerably stronger still is the nuclear force which holds the nuclei together and this is called the *strong interaction*. The fourth force is called the *weak interaction* and is intermediate in strength between electromagnetic and gravitational forces. It is responsible for a number of phenomena of which the best known is β-radioactivity.

Particles may respond to some or all of the forces. Protons are involved with all of them but electrons respond to all except the "strong interaction." When new particles are discovered physicists try to find out their fundamental properties and among these is their response (if any) to each kind of force. Some other basic properties are: electric charge (if any), mass (if any), and the speed with which the particle splits up spontaneously into other types.

In the last few years *Pears* has contained a table of "elementary particles" headed The Atomic Family. By 1965 so many of these had been discovered (about a hundred) that the whole conception of "elementary-ness" was in question. Are all the particles equally "elementary"? Are some of them excited states or combinations of others? When a family reaches a hundred it becomes difficult to believe they are *all* grandparents. One current trend is away from setting up a hierarchy in which some particles are elementary and some composite and towards treating them all as mutually dependent for their existence. This, however, is a very difficult problem, not yet solved.

A few particles are stable but most decay into products. The lifetimes of unstable particles are extraordinarily short by everyday standards but, even so, some (of about 10^{-17} sec. or upwards) are much longer than others (of about 10^{-23} sec.). The Table on page **F14** contains the stable particles and a *selection* of the moderately unstable ones with brief comments on their properties.

The Table shows a rudimentary classification into four groups: (i) the photon; (ii) leptons—which are particles, lighter than protons, which do not react to the "strong" type of force; (iii) mesons—which are particles, lighter than protons, which are subject to all the kinds of force; (iv) baryons—which include protons, neutrons, and heavier particles, all of which react to the "strong" force. Many of these particles have been produced for the first time in recent years by bombarding matter with beams of high energy particles. Much of this work is done in the large accelerating machines at Brookhaven, New York, and the European Organisation for Nuclear Research, Geneva.

Forming particles into groups is an important matter. It is comparable with arranging chemical elements into the Periodic Table. The pattern does not of itself explain anything but it strongly suggests where to look for explanations. The classification of particles currently favoured is based on the very sophisticated mathematical ideas known as *group theory*. Group theory is a branch of mathematics which is finding increasing application in physics and it had a resounding success recently which illustrates the value of grouping. It turned out that there was no known particle to occupy a vacant position in one of the family groups required by the theory. This particle, the omega minus, was sought and found with exactly the right properties in February 1964. This is reminiscent of finding the missing elements in the Periodic Table. The discovery of omega minus generated much excitement in the scientific world and many physicists believe that a new and deeper understanding of fundamental physics is just round the corner. If this turns out to be so, then the careful grouping and classification of particles according to regularities in their properties will have played a vital role.

Conclusion.

Over a century's development of the atomic ideas has brought a progressive, if jerky, increase in the mathematical precision of the theories. In some fields of particle physics, observations to one part in a million, or even better, can be explained, to that level of accuracy, by the existing theories. At the same time, however, the theories have lost visual definition. An atom as an invisible but none the less solid billiard ball was easy enough; so was a light wave conceived like a sound wave in air. Even after Rutherford, an atom consisting of a miniature solar system merely exchanged the solid billiard ball for a system of revolving billiard balls and was no great obstacle to visualisation. But since quantum theory and the Uncertainty Principle, every unambiguous visualisation of fundamental wave-particles leaves out half the picture, and although the electrons are in the atom, we can no longer represent them in definite orbits. The moral seems to be that visualisation is unnecessary, or at best a partial aid to thought. All the theoretical knowledge is in the equations, and these are very precise. Hence the non-physicists' grumble—that physics is too mathematical these days—has some justification, and hence also the growing distinction in physics between the theoreticians, who are usually mathematically trained, and the experimenters, who can rarely read the papers their theoretical colleagues write, but provide the results for them to write about.

II. THE PROPERTIES OF MATTER IN BULK.

One of the most obvious and at the same time most wonderful things about the properties of matter is their great variety. Think of air, diamond, mercury, rubber, snow, gold, pitch, asbestos. . . . Even the differences of state of the same chemical substance are remarkable enough, ice, water, and steam, for example. One of the aims of physics is to reach an understanding of all these different properties by explaining them in terms of the behaviour of the particles discussed in the previous section (**F9–15**). The widespread success with which this imposing programme has been carried out indicates the maturity of physics. It is difficult to think of any major property of matter in bulk for which there is not some attempted theoretical explanation, though future physicists will no doubt regard some present-day theories as rudimentary or incorrect.

Physics, Statistics, and Thermodynamics.

Take a number equal to the population of London, multiply it by itself, and multiply the product by another million. The answer is about the number of molecules in 1 cubic centimetre of ordinary air. They are constantly moving about and colliding with one another. Even if the nature of the molecules and their laws of motion were perfectly understood, it would clearly be impracticable to calculate the exact paths described by each particle of so vast an assembly. This difficulty brought into being a whole branch of physics concerned with calculating the overall or average properties of large numbers of particles. Just as statisticians will provide the average height, income, expectation of life, and so on, of the population of London, without knowing everything about every individual, so statistical physicists can work out average properties of molecules or atoms in large groups. This important branch of physics is called *Statistical Mechanics*. It was founded in the nineteenth century by Maxwell, Boltzmann, and Gibbs and is still being actively developed.

Consider now all the molecules in 1 cubic centimetre of air contained in a small box. They are continually bombarding the walls of the box and bouncing off. This hail of impacts (it is actually about 10^{23} impacts per square centimetre per second) is the cause of the pressure which the gas exerts against the walls of the box. Now suppose we pump air in until there is twice as much as before, though the box is still the same size and at the same temperature. This means that the density of the gas (*i.e.*, the mass of 1 unit of volume) has doubled. We should now expect twice as many impacts per second on the walls as before, and consequently twice the pressure. We therefore arrive at a conclusion that, if the volume and temperature are constant, the pressure of a gas is proportional to its density. This is one of the simplest statistical arguments that can be checked against observation; in fact, it stands the test very well.

Heat, temperature, and energy.

The proviso about the temperature remaining the same is an important one for the following reason. In the nineteenth century there was much discussion about the nature of heat. To Joule we owe the now well-established view that heat is equivalent to mechanical work. In one of his experiments, in the 1840s, the work necessary to rotate paddle wheels against the resistance of water in a tank generated heat that caused a slight rise in the temperature of the water. Joule found out exactly how much work was equivalent to a given quantity of heat. However, one can do other things with work besides generate heat; in particular, work creates motion, as when one pushes a car. Bodies in motion possess a special form of energy, called kinetic energy, which is equal to the work done in accelerating them from a state of rest. We have, then, three closely connected ideas: work, heat, and kinetic energy. Now according to the views of the nineteenth century, which are still accepted, any heat given to a gas simply increases the kinetic energy of its molecules; the hotter the gas, the faster its molecules are moving. If, therefore, the gas in our box is allowed to get hotter there is an increase in molecular speed, and the impacts on the walls become correspondingly more violent. But this means the pressure increases, so we have another law: if the density remains the same, the pressure increases if the temperature does.

Laws of Thermodynamics.

Such considerations as these have been pursued with great elaboration and subtlety. The notions of heat, temperature, energy, and work—familiar but vague in everyday life—have been given precise definitions, and the relations between them have been enshrined in the Laws of Thermodynamics. Enshrined is perhaps a suitable word because these laws are so soundly and widely based on experimental results that they have greater prestige than any others in physics. If any proposed physical law comes in conflict with thermodynamics, then so much the worse for that law—it has to be revised. It is sometimes asserted that no one is properly educated who does not understand the Second Law of thermodynamics. We cannot, therefore, leave this section without at least stating the two best known thermodynamic laws:

First Law: *If any physical system is given a quantity of heat, and if the system performs som work, then the energy of the system increases by an amount equal to the excess of heat given over work done.* This law asserts that heat, energy, and work are convertible one into the other, and tha all such transactions balance exactly. This i one form of a principle accepted as fundamenta in all science, *viz.*, the Principle of the Conservation of Energy, according to which energy can never be created or destroyed, but only changed from one form to another.

Second Law: *It is impossible to make an engin which will continuously take heat from a hea source and, by itself, turn it all into an equivalen*

nount of mechanical work. In fact, all engines
hich produce work from heat—steam engines
r example—always use only a fraction of the
eat they take in and give up the rest to some
latively cool part of the machine. The Second
aw makes this obligatory on all work-from-heat
evices. This statement of the Second Law has
engineering ring about it and, indeed, it arose
om the work of the nineteenth-century French
gineer Carnot. Nevertheless, it can be re-
rased in very abstract terms, and has been
plied with unbroken success to all fields of
ience involving the transfer of heat and allied
atters. It sets a definite limit to the kinds of
ysical process that can be conceived to take
ace. Nothing has been known to contravene it.

e States of Matter.

The molecular motion in gases has been referred
in the previous section. Tacitly it was assumed
at each molecule acted independently of all
hers, except that collisions occurred between
em. In reality, molecules exert attractive
rces on one another and, if a gas is cooled so that
olecular movements become relatively sluggish,
time comes when the attractive forces succeed in
awing the molecules close together to form a
uid. This process is called condensation.

The molecules in a liquid are packed tightly to-
ther and they impede each others' movements.
the other hand, movement still persists, and
e molecules struggle about like people in a mill-
g crowd. Besides wandering about, the mole-
les vibrate. These motions represent the energy
ntained in the liquid.

The fact that the molecules, though irregularly
cked, can still slip past one another and move
om place to place, explains the essential property
liquids that distinguishes them from solids—
ility to flow. As a matter of fact, although the
ther vague assertion that in a liquid molecules
e irregularly packed would be generally accepted,
ere is no agreed opinion on what the irregularity
actually like. Indeed, not only the precise
ucture of liquids, but the theory of liquids in
neral, is fraught with such considerable mathe-
atical difficulties that the liquid state is much
s well understood than the solid or gaseous.

Most solids are crystals. The popular idea of a
ystal is of something which has a more or less
gular geometrical form with faces that glint in
e light—like snowflakes or gems. However,
ystallinity really depends on a regular inner
ttern of the atoms, and may or may not show
elf on the visible surface. A lump of lead,
example, is crystalline, though it may not
k it.

The actual arrangement of the atoms in a
ystal can be extremely complex. Some are
ite simple, however. The largest model of a
ystal structure must surely be the 400-ft.
Atomium" building in the 1958 Brussels
hibition. This consisted of eight balls,
presenting atoms, situated at the corners of a
be, and one more ball exactly in the middle.
agine this repeated in all directions so that
ery ball is the centre of a cube whose corners
e the eight neighbouring balls. This is known
crystallographers and physicists as the "body-
ntred cubic structure"; it is the actual arrange-
ent of atoms in iron, sodium, chromium, and
ne other metals. If every ball, instead of
ing the centre of a cube, were the centre of a
gular tetrahedron (a solid figure with four equal
angular faces), and had its four neighbours
the corners of the tetrahedron, then we should
ve the "diamond structure." This is how the
rbon atoms are arranged in diamonds.

In crystals the atoms are locked into a regular
dered structure by attractive forces which give
e solid its rigidity and prevent it from flowing.
e atoms are so close together that any attempt
press them closer involves crushing or distorting
e atoms—a process they resist strongly. This
plains why solids (and liquids too) are so
ficult to compress. Gases can easily be com-
essed because there is so much space between
e molecules.

The distinction between solid and liquid is not
sharp as is commonly supposed. A lump of
ugh will not bounce, but is plastic; a steel
l-bearing is very elastic and bounces excellently, but one cannot mould it in the fingers. Neither dough nor steel qualifies for description as a liquid. There are, however, substances which can be moulded like plasticine into a ball that will then bounce very well on the floor like an elastic solid, and finally, if left on a flat table, will spread into a pool and drip off the edge like a liquid. There is no point in trying to force such things into rigid categories. One may say instead that for short, sharp impacts the material behaves like an elastic solid, but under long-sustained forces it flows like a liquid. The properties of these, and many other anomalous materials, are increasingly engaging the attention of those who study the science of flow—*rheology.* It is interesting to see how many familiar and important materials exhibit peculiar rheological behaviour—paint, dough, ball-pen ink, cheese, unset cement, and solutions of nylon and other plastics are only a few examples.

Inside a Crystalline Solid.

We now return to our wallpaper analogy of crystal structure and give some free play to our visual imagination.

Suppose we have walls papered with a regular pattern of, say, roses, fuchsias, and green leaves. These represent the different kinds of atoms in the solid. Careful observation shows that the whole pattern is shimmering. The flowers and leaves are not stationary, but are undergoing slight random oscillations about their proper positions. In a crystal these movements are called thermal vibrations, and are never absent. The hotter the crystal, the more the vibration, and at a high enough temperature the vibrations become so great that the atoms get right out of position and the pattern disappears altogether, *i.e.*, the crystal melts. Thermal vibrations are essential to the theory of solids, and are responsible for numerous physical properties.

Next we note something extraordinary about some of the papered walls. On these the paper has been hung in irregular patches fitted together like a not very well-made jig-saw puzzle. Lines of roses which should be vertical are horizontal in some patches, oblique in others. This represents the situation in most ordinary solids, for they consist of many small pieces of crystal irregularly packed together. Such material is called *polycrystalline,* and the small pieces are *crystal grains.* Crystal grains may be almost any size, sometimes visible to the naked eye, as often on galvanised iron.

However, on one wall, we see excellent regularity and no obvious patches at all. The physicist would call this a *single crystal,* and several techniques exist for preparing them. Natural single crystals can be found, and there are some beautiful large single crystals of rock salt. But on examining the single crystal wall closely, we find a number of places where the paperhanger has failed to make adjacent pieces register perfectly—there is a slight disjointedness. This occurs in real single crystals, and the line along which the structure fails to register is called a *dislocation.* These are much studied by physicists because of their bearing on the mechanical properties of solids, on the yielding of metals under strong stress, for instance.

This by no means exhausts the possibilities of the wallpaper analogy; several other phenomena can be found. For example, in a place where there should be a fuchsia there is actually a daffodil—something completely foreign to the pattern. Or perhaps a small wrongly shaped leaf is jammed between the proper leaves in a place that should really be blank. These represent chemical impurity atoms. The first is called *substitutional,* because it occupies the position of an atom that should be there, the second is called *interstitial,* because it does not. Substitutional impurities of indium metal, deliberately added to the semi-conductor germanium, make possible the manufacture of transistors (*see* Section L). Some steels derive their valuable properties from interstitial carbon atoms within the iron pattern.

What physicists call a vacancy would occur if a flower or leaf were simply missing. Remembering that all the atoms are vibrating, we should not be surprised if occasionally an atom jumps into a neighbouring vacancy if there happens to be one, *i.e.*, the atom and the vacancy change places. Later this may occur again. In the course of time, a rose which was near the ceiling may make its way to the floor by jumping into vacant rose positions when they occur near enough. This process, which the physicist calls *diffusion*, is also analogous to the game in which numbers or letters can be moved about in a flat box because there is one vacant space to permit adjustment. The more vacancies there are in a crystal, the faster diffusion occurs. It is, in fact, very slow in solids, but is nevertheless evidence that apparently quiescent materials are really internally active.

Metals, Electricity, and Heat.

There is ample evidence that inside metals there are large numbers of free electrons. To illuminate this statement let us take sodium metal as an example. One single sodium atom has a nucleus with eleven protons; there are therefore eleven electrons in the atom. The outermost one is easily detached, leaving a positively charged sodium ion behind. We may think of these ions arranged in the three-dimensional pattern characteristic of sodium crystals. It is the same as the iron structure previously described. The detached electrons, one per atom, occupy the spaces in between. The usual metaphor is that the structure of ions is permeated by a "gas" of electrons. Like all visualisations of fundamental particles, this must be taken as a rough approximation. The important point is that the electrons in the gas are not bound to individual atoms but may wander freely about the crystal, hindered only by the collisions they make with the vibrating ions.

This is the picture as it appeared to physicists of the first decade of this century, and we can explain many properties of metals with it. Naturally the theory has developed greatly since then, thanks to the great work of Lorentz, Sommerfeld, and Bloch; it now relies heavily on quantum theory, but it is surprising how little violence is done to modern ideas by the simple picture we are using.

The free electrons move randomly in all directions at thousands of miles per hour. If the metal is connected across a battery it experiences an electric field. Electrons are negatively charged particles, and are therefore attracted to the electrically positive end of the metal. They can move through the metal because they are free; this flow is not possible to those electrons which remain bound to the ions. The function of the battery is to keep the flow going and, for as long as it is going, it is the electric current.

The flow of electrons is not unimpeded. They constantly collide with the ions and are deflected from the path of flow. This hindrance is what the electrician calls *electrical resistance*. The electric force, due to the battery or a dynamo, accelerates the electrons, thus giving them extra energy; but they lose this to the ions at collisions because the ions recoil and vibrate more than before. The net effect of innumerable collisions is to increase the thermal vibrations of the ions, *i.e.*, to make the metal hotter. This is the explanation of the fact well known to every user of electric irons: that electric current heats the conductor. If a strong current is passed through a wire, the heating is so great the wire glows, as in electric-light bulbs, or melts and breaks, as in blown fuses.

If one end of a metal rod is heated we soon feel the heat at the other end; metals are excellent thermal conductors. This is because the mobile free electrons carry the heat energy down the rod, passing it on to the ions by colliding with them. Substances without free electrons cannot do this, nor can they conduct electricity well; so we have, in the free electrons, an explanation of the fact that the good electrical conductors are the good heat conductors. For technical purposes, it would be useful to have electrical insulators that would conduct heat well, and *vice versa*; but this is almost a contradiction in terms, and one can only compromise.

Non-conductors and Semi-conductors.

There are some elements, and numerous compounds, in which all the electrons are so tightly bound to their parent atoms that free electron flow is impossible. These materials are electrical and thermal insulators.

Let us return to our sodium atom. It readily loses its outer electron, forming a positive ion. The ion is very stable; indeed, its electron arrangement resembles the "closed shell" belonging to the inert gas neon. The chlorine atom, on the other hand, would have a very stable structure, resembling the inert gas argon, if only it could be given one extra electron to complete the closed shell. If the outer sodium electron were given to a chlorine atom we should have two stable ions, one positive and one negative. These would then attract each other and form a compound. This is just how common salt, sodium chloride, is formed, and its crystals consist of a regular network of alternate sodium and chlorine ions. As all the electrons are bound to ions, it is not surprising that salt will not conduct electricity or heat to any appreciable extent. Not all insulating compounds are built on this pattern, but all have structures which bind the electrons tightly.

We have seen (**F17**) that Nature does not permit a hard-and-fast distinction between solids and liquids; nor does she between conductors and insulators. Over a hundred years ago, Faraday knew of substances which would conduct electricity, but rather badly. A common one is the graphite in pencils. Others are the elements selenium, germanium, and silicon, and a considerable number of compounds. Such substances are called semi-conductors.

Semi-conductors conduct badly because they have so few free electrons, many thousands of times fewer than metals. In very cold germanium—say, 200 degrees below freezing—all the electrons are tightly bound to atoms and the substance is an insulator. It differs from normal insulators in that, on warming it, the gradually increasing thermal vibration of the crystal detaches some of the electrons, for they are only moderately tightly bound. The warmer the crystal becomes, the more of its electrons become detached and the better it conducts electricity. By about the temperature of boiling water, there are so many freed electrons that conduction is moderately good, though less good than in metals. This is basic semi-conductor behaviour. Because transistors can be made of germanium, and because they are of such great technical importance, more knowledge has accumulated about germanium than about any other material. *See also* Transistor, Section L.

Magnetism.

The most important thing about magnetism is that it is inseparably connected with electricity. Oersted showed this in July 1820, when he deflected a magnetic compass needle by passing an electric current through a wire near it. Since then, many experiments have shown that wherever a current flows there will certainly be a magnetic field in the surrounding space. The laws of this are very well known now—they are the Maxwell equations previously referred to (**F13**). However, most people first meet magnetism when, as children, they pick up pins with a magnet. Where is the electricity here? and what is a magnet?

The explanation of magnetism exemplifies beautifully the technique of explaining the bulk properties of matter in terms of fundamental particles. In the atoms the electrons are moving, and a moving electric charge constitutes an electric current. Therefore each moving electron is a tiny source of magnetism. It does not immediately follow that every atom is a source of magnetism because it might—and often does—happen that the magnetic effect of different electrons in the atom cancel out. In helium atoms, for example, the two electrons have equal but opposed magnetic effects. Nevertheless, some atoms and ions have a net effect called their *magnetic moment*. This simply means they behave like tiny magnets. Crystals containing such atoms will be magnetic, though the magnetism is much weaker than in ordinary magnets because the different atoms largely annul one another's effects. In a very limited number of crystals, however, the magnetic ions act on one another in a special way which forces all the omic magnets to point in the same direction. he total effect of many co-operating atoms is ery strong and the crystal becomes what we ormally call a magnet. Iron acts like this, so cobalt and nickel, the rarer elements gadolin- m and dysprosium, and a fair number of alloys. n the whole, this behaviour, which is called *rromagnetism*, is very rare. The reason for the -operation of all the atomic magnets is not plained to everyone's satisfaction yet, though e key idea was given by Heisenberg in 1928.

In the section dealing with the electron it was binted out that every electron has an *intrinsic* agnetic moment. This is in addition to any fect simply due to the electron's motion round nucleus. The net effects of ions are therefore rtly due to the intrinsic magnetism of ectrons. In the ferromagnetic metals the latter by far the most important contribution. Thus pick up pins, and benefit from magnets in her ways, because innumerable fundamental rticles act in co-operation for reasons that are ll somewhat obscure. It is interesting to ask nether the electrons responsible for magnetism e the same free electrons that allow the metals conduct electricity. It is thought not.

We are accustomed to think of magnets as metallic. Actually the magnet originally discovered by the Chinese was the mineral lodestone, which is a non-metallic oxide of iron. Nowadays a number of non-metallic magnets are made. They are called *ferrites*, and some are insulators and some are semi-conductors. The combination of magnetism and insulation is technically very valuable in radio, radar, and other applications. The explanation of ferrite behaviour is related to that of metallic ferromagnetism, but is not the same.

Conclusion.

The aim of the second part of this account of physics is to show how our conception of fundamental particles allows us to build theories of the properties of matter. This very aim shows that the two "major divisions" of physics referred to at the beginning (F9) are divided only in the way that labour is divided by co-operating workers to lighten the task. For the task of physics is a very great one—no less than to explain the behaviour of matter; and since the universe, living and inanimate, is made of matter, physics must necessarily underlie all the other sciences.

II. BIOLOGY—THE SCIENCE OF LIFE.

Biology embraces the study of all living things ich exist on earth at the present time and also recognisable remains of those that are extinct. ring things or organisms range from the parently simple micro-organisms such as viruses l bacteria to the largest animals and plants.

ing Processes.

The enormous variation and complexity of ng processes make the task of understanding l defining life a very difficult one. Every living anism undergoes continual physical and mical changes which, in spite of their diversity, referred to as the metabolism of the organism. tabolism involves the processing of food terials, the production of waste products, and the intermediate stages between these whereby rgy and matter are provided for the operation, intenance, and growth of the organism. These ctions are under very exact chemical or nervous trol at every stage and can be slowed down or eded up as the need arises. Thus the organism react to changes in the environment in which ves, adjusting its activities in relation to the ex- al changes. Finally, organisms can reproduce er in an identical or very slightly modified n. In this process new individuals are pro- ed and the species continues to survive. erences between offspring and parents can, er certain circumstances, act cumulatively many generations and so form the basis of utionary change in which new species of nism are ultimately formed.

ecular Biology.

has been evident for many years that the t fundamental aspects of these living processes r in basic structural units known as cells. We l examine this level of organisation first before ttempt to look at the larger questions of the nisation of multicellular animals and plants their interactions in groups or populations. study of living processes at the molecular and evel has been given a tremendous impetus in nt years by the advent of new techniques h enable microscopic and submicroscopic parts ll to be examined. Physicists, chemists, and nematicians have found themselves working gside biologists in this field and several of the notable advances have been made by physical tists. At this level of organisation the tradi- l division of Biology into Botany, the study ants, and Zoology, the study of animals, has meaning. Even the more recent Genetics, study of inheritance, Biophysics and Bio- istry, concerned with the physics and chemistry of organisms, and Cytology, the study of cell structure, are losing such identity as they may once have had. Molecular biology is a term frequently used in describing this rapidly expanding and fascinating field of research.

THE CELL.

Cells were first seen in 1665 by Robert Hooke when he looked at a piece of cork under his primitive microscope. It was not until 1839, however, that Schlieden and Schwann produced the cell doctrine which visualised the cell as both the structural and functional unit of living organisation. Exceptions may be found to the cell doctrine. For example, some protozoa, algae, and fungi show very complex internal organisation but are not divided into cells; they are usually called acellular organisms. The viruses also constitute a difficulty since in many ways they are intermediate between living and dead matter. They are absolutely dependent on cells of other organisms for their continued existence. Outside living cells they are inert molecules which may take a crystalline form. Inside a host cell, however, they become disease-producing parasites which multiply and show many of the other properties of living organisms. They are minute and lack the complex organisation usually associated with cells. Notwithstanding their somewhat ambiguous position, the viruses are often treated as though they were single cells or parts of cells and their extreme simplicity has made them ideal material for many types of research at this level. The bacteria also lack some of the properties of cells but the differences are not so clearly defined as they are in the case of viruses.

Structure and Function of Cells.

Though the constituent cells of a multicellular organism are usually specialised to perform particular functions, they have a great many features in common. The cell is often said to be made up of a substance called protoplasm, a term for the fundamental material of life which dates from the 19th cent. Protoplasm has two main constituents, the cytoplasm and the nucleus, and is bounded on the outside by a cell or plasma membrane. Plant cells generally have an additional wall composed primarily of cellulose and used for support. The nucleus is the controlling centre of the cell and has rather limited metabolic capabilities. The cytoplasm contains various subunits which operate to produce energy and new cell structure during the normal metabolism of the cell.

Cells take up the raw materials for metabolism through the cell membrane from extracellular fluid which surrounds them. The nutrients include carbohydrates, fats, proteins, minerals, vitamins, and water. Fats and carbohydrates are important principally as sources of energy, though both types of compound are found in permanent cell structure. Proteins are complex substances of high molecular weight which contain nitrogen in addition to the carbon, hydrogen, and oxygen found in the other compounds. They are of fundamental importance in the structure and function of the cell and are built up of a number of simple nitrogen-containing organic molecules called amino acids. There are twenty amino acids occurring commonly in nature so that the number of possible combinations in large protein molecules is quite clearly enormous. A group of proteins whose significance is well established are the enzymes which are the catalysts of chemical reactions in living cells. Each enzyme will control and speed up a specific reaction even though it is present in very small amounts and is usually unchanged at the end of the process. A large number of inorganic mineral salts are essential for cells to function normally. Some, such as sodium, potassium, and calcium salts, are needed in considerable quantity; others are required only in trace amounts and these include iron, copper, and manganese. The trace elements are usually important constituents of enzyme systems. Vitamins are also necessary in very small amounts and it seems reasonable to conclude that their function is also a catalytic one in parts of some enzyme systems.

I. CYTOPLASM.

For a long time cytoplasm was thought to be a homogenous and structureless substrate in which enzymes occurred as part of a general colloidal system. With the refinement of techniques such as electron microscopy and ultracentrifugation, more and more identifiable components have been found within the cytoplasm. It now seems certain that the material other than these recognisable particles is not a structureless matrix but a highly organised and variable complex at the molecular level.

Identification of Components: recent techniques.

Ultracentrifuge.

When soft tissues such as liver are ground up in a homogeniser, which usually takes the form of a plunger fitting fairly tightly into a glass tube, the cells are broken up but the smaller particles escape destruction. The particles remain in a highly active biochemical state if the salt concentration of the liquid into which they are released by homogenisation is more or less the same as that within the cell from which they came. Early failures to isolate cell fractions were almost all attributable to osmotic difficulties in which differences of salt concentration led to the movement of water into or out of the particles and to their subsequent destruction. The homogenate can be treated in a centrifuge in which high speed rotation subjects the particles to forces many thousands times greater than gravity. As a result the heaviest particles, such as the nuclei, are deposited first on the bottom of the centrifuge tube. The liquid is then transferred to another tube and the process repeated at a higher speed which brings down slightly lighter particles called mitochondria. The next collection of particles which can be obtained is called the microsomal fraction. By careful use of this technique, biochemists can produce a variety of cell constituents which can be studied in the absence of all the other reacting systems of the cell.

Radioactive Isotopes.

In many of the studies of cell chemistry which have been made on whole cells, on cell fractions, or on isolated enzyme systems, progress has been due in a large part to the availability of isotopes. With the aid of compounds prepared in the laboratory and labelled with the radioactive isotopes of elements such as carbon, hydrogen, nitrogen, oxygen, sulphur, and phosphorus, biochemists can now follow the metabolic fate of these substances in living organisms. The presence of a radioactive "labelled" element in any of the products of metabolism can be determined by means of Geiger and scintillation counters. The studies involving radioactive isotopes have shown more clearly than any others that living material is never static but is in a state of dynamic equilibrium. Substances are constantly broken down and replaced by other substances so that an organism may appear to be more or less unchanging but its components are always turning over.

Light Microscopy.

Many of the particles which can be isolated and studied have been identified within the living cell by means of the light microscope. Especially useful in this respect have been the phase contrast and interference modifications which make structures of different refractive index visible and do not depend on differences in light absorption as does the ordinary instrument.

Electron Microscope.

In light microscopy true images of particles smaller than the wavelength of light cannot be formed. Great difficulty is experienced in resolving particles much smaller than 0·5 microns (0·0005 millimetre) in size. The electron microscope, which uses a beam of electrons instead of light, is capable of much greater resolution because electrons behave as rays of extremely short wavelengths. Details as fine as 20 Ångstroms (0·002 microns) have been resolved and a tremendous amount of structure has been revealed by this instrument. However, many of the objects which are well known from electron microscope studies have not been isolated nor have functions been ascribed to them. Conversely, much of the biochemistry of cells cannot be linked to known structures. One of the great limitations of the electron microscope is that it can only be used to examine very thin slices of dead material.

X-ray Diffraction.

A method which can reveal a great deal of information about the arrangement of constituent parts in very complex biological molecules is that of X-ray diffraction. In this method X-rays are reflected from regularities in the molecular structure so as to form a pattern characteristic of the structure. Studies of X-ray diffraction patterns can be made on living material so that the internal shape of biological molecules can be worked out and the changes, if any, followed during phases of activity. In many ways X-ray diffraction has been useful in filling the gaps between biochemical studies of molecular behaviour and the essentially static view of cell structure obtained from the electron microscope.

Constituents of Cytoplasm.

The following are some of the particulate and membranous constituents of cytoplasm which have been identified and analysed with varying degrees of success by these and many other techniques:

1. Mitochondria and Oxidation.

Mitochondria vary in shape from cylindrical rods to spheres and in size from 0·2 to 3·0 microns. When seen in the living cell they are in constant motion. The whole structure is enclosed within a thin double membrane, the inner layer of which is thrown into folds extending across the central cavity of the mitochondrion and dividing it into small chambers. The function of mitochondria is to provide energy for the reactions of the rest of the cell. Almost the whole machinery for the oxidation of foodstuffs is to be found in the mitochondria and, as might be expected, is related in some way to the complex structure. Slight damage to the mitochondrion will render it unable to carry out a complete cycle of oxidative processes. Destruction of parts of the double membrane system prevents the production of energy-rich phosphate bonds in adenosine triphosphate (ATP) in which energy is stored and transported about the cell.

ie Krebs Cycle.

The oxidative reactions which produce the
ergy are quite unlike those in which hydro-
rbons are burnt in the laboratory. They pro-
ed through a large number of controlled steps
ring which the energy is slowly evolved. The
sic fuel substances, carbohydrates, fats, and
oteins, are broken down outside the mito-
ondria to four major intermediate products
ich are pyruvic acid, oxalacetic acid, acetic acid
d ketoglutaric acid. These acids diffuse into
e mitochondria and are oxidised in a cyclical
stem of reactions called the Krebs or citric acid
cle which ultimately leads to the production
carbon dioxide and water. The actual oxida-
n of the various compounds participating in
e cycle is brought about by a series of enzymes
scribed as an electron transport chain. Oxida-
n in these cases is essentially a removal of
ctrons from the substrate, invariably accom-
nied by an equal number of hydrogen nuclei.
e electrons, sometimes with and sometimes
thout the hydrogen nuclei, are passed from one
npound to another until eventually they com-
ne with oxygen to form water. One of the best
own electron transport systems is that involving
n-containing substances called cytochromes.

An example of a typical stage in the Krebs cycle
the conversion of succinic acid to fumaric acid
der the control of the enzyme succinic dehydro-
nase. Both acids are compounds containing
ır carbon atoms but the latter has two electrons
d two hydrogen nuclei fewer than the former
ich is therefore said to be oxidised during the
nversion. The electrons are accepted by the
t member of a chain of cytochromes which is
ıs reduced and the hydrogen is set free as hydro-
n ions. The electrons are passed down the
ain of cytochromes which are reduced in turn
d re-oxidise the earlier members of the chain.
the final stage the reduced cytochrome is
idised by oxygen which accepts the electrons
d combines with the hydrogen ions to form
ter. These steps produce energy, but this does
t all appear as heat because some is used to
ve a reaction which consumes energy. The
t law of thermodynamics states that such a
ıpling is necessary if a high energy compound
to be produced. The energy consuming
ction is the conversion of adenosine diphosphate
DP) to adenosine triphosphate (ATP) with its
ergy-rich phosphate bond. The whole process
known as oxidative phosphorylation. The
tochondria produce far more energy than they
uire and the ATP passes into the cytoplasm for
in the rest of the cell.

Chloroplasts and Photosynthesis.

Chloroplasts are particles found in cells in the
en parts of plants, in fact they contain the
en pigment which is called chlorophyll. They
involved in the extremely important process
own as photosynthesis in which energy absorbed
n light is used to synthesise carbohydrates
n carbon dioxide and water, oxygen being
med as a by-product.

Chloroplasts are disc-shaped or flat ellipsoids
n 2 to 20 microns across, possessing a complex
ıcture which in many ways is reminiscent of
t found in mitochondria. A typical double
nbrane surrounds the structure and the inside
nade up very largely of a stack of discs consist-
of paired membranes connected at their ends
orm closed systems. This seems to be a further
elopment of the type of lamellated structure
n dividing the central cavity of a mitochond-
. The chlorophylls and other pigments, such
the orange yellow carotenoids, seem to be
nged in layers a single molecule thick in the
oroplast discs so that they are maximally
osed to light.

tosynthesis.

n photosynthesis there are two somewhat
ependent sets of reactions, one needing light
the other going on in the dark. The primary
cess is the absorption of light quanta by the
rophyll which causes some of the electrons of
nolecule to pass from one orbital to another and thus enter an excited state. It is thought that chlorophyll then loses electrons which pass either to a recently discovered protein called ferrodoxin or to another oxidising agent, plastoquinone. The electrons from plastoquinone are transferred via a complex series of steps involving a cytochrome chain back to the chlorophyll. During these sequences oxygen is liberated from water molecules and energy-rich phosphate bonds are produced. The production of ATP in this reaction, which can only take place in the light, is called photosynthetic phosphorylation and, in this respect, makes plants independent of stored carbohydrate as their primary energy source.

The reactions so far described have not involved carbon dioxide and though it is possible to make the system operate solely in this way it is not usual for it to do so. Normally the electrons from ferrodoxin are passed to another electron accepting system together with hydrogen ions from water. At the same time, as recent isotope studies have revealed, carbon dioxide is combined with a 5-carbon sugar and the resulting compound immediately splits into two molecules of a 3-carbon, phosphoglyceric acid. The reduced electron system which has oxidised ferrodoxin now comes into operation and, together with energy from ATP, is used to synthesise sugar and starch from the 3-carbon compounds. The reactions in which carbon dioxide is taken up or "fixed" and then reduced during the formation of sugar, can go on in the dark unlike those of photosynthetic phosphorylation described earlier.

The importance of this process whereby plants can make use of the energy in sunlight to fix carbon dioxide and produce carbohydrates is quite clear. The whole animal population of the world, including man, is dependent on plants for food since even the meat-eating carnivores prey upon herbivores. Although scientists continue to make efforts to produce adequate food materials from simple compounds, there is still no better machinery known for doing this than the plant cell. Man is dependent on photosynthesis not only for his supplies of food but also for much of

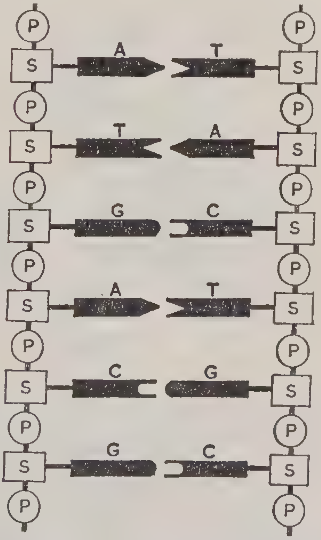

FIG. 1. *Nucleic Acids.* A portion of a DNA molecule showing how it is made up of two strands of nucleotides. Each nucleotide consists of a base, which may be Adenine (A), Thymine (T), Guanine (G), or Cytosine (C), united to the Pentose Sugar, Desoxyribose (S), in turn joined to Phosphoric Acid (P). The nucleotides are linked through the phosphoric acid groups. The two strands are held together by hydrogen bonds between bases, adenine linking only with thymine, and guanine only with cytosine.

his fuel, since much of the combustible material removed from the earth is of plant origin. In this respect atomic energy may eventually prove to be an adequate alternative.

3. Endoplasmic reticulum, Ribosomes, and Protein Synthesis.

A network of elaborate and oriented double membranes existing within parts of the cytoplasm can be seen in the electron microscope. In the space between the pairs of double membranes small granules are visible, either free in the space or attached to a membrane. The whole system is called the endoplasmic reticulum or ergastoplasm. When the cell is homogenised and centrifuged the endoplasmic reticulum appears as the microsomal fraction. Biochemical analysis after separation of the membranous from the granular components reveals that the former is composed largely of phospholipids and cholesterol, which are compounds closely related to fats, and the latter of ribonucleic acid (RNA).

Nucleic Acids.

The term nucleic acid covers a class of substances, usually of great complexity, built up from smaller units called nucleotides. Each nucleotide consists of a base, united to a sugar, in turn united to phosphoric acid. Nucleotides are joined together in a linear fashion by means of the phosphoric acid residues to form a chain from which the bases project at right angles (Fig. 1). Two types of sugar are found in naturally occurring nucleic acids and these are the ribose of RNA and the desoxyribose of desoxyribonucleic acids (DNA). We shall return to the latter when the nucleus is considered. Four nitrogen-containing bases occur in nucleic acids and in RNA—adenine, cytosine, guanine, and uracil. In DNA the uracil is replaced by thymine.

Protein Synthesis.

There is good evidence that RNA is manufactured exclusively within the nucleus and subsequently moves out into the cytoplasm. Some of it, called ribosomal RNA, unites with protein to form the granules, or ribosomes, of the endoplasmic reticulum. Another form, called messenger RNA, also migrates from the nucleus to associate with ribosomes but does not become incorporated into their permanent structure. It is also well established that the ribosomes are closely linked with protein synthesis in the cell because radioactive amino acids, when fed to an animal, are always found first in the ribosomes before any other cell structure. The specification for a particular protein is not carried on the ribosome which is merely the factory for making these complex molecules. It is thought that messenger RNA carries instructions from the nucleus which specify exactly the protein to be synthesised at a ribosome. This is done by means of a code in which a "triplet" of three nucleotide bases codes one amino acid (Fig. 2). Thus on a long molecule of RNA, three adjacent uracil bases would specify an amino acid called phenylalanine. If these were followed on the RNA molecule by one uracil and two guanines then the amino acid tryptophan would be specified and this would be

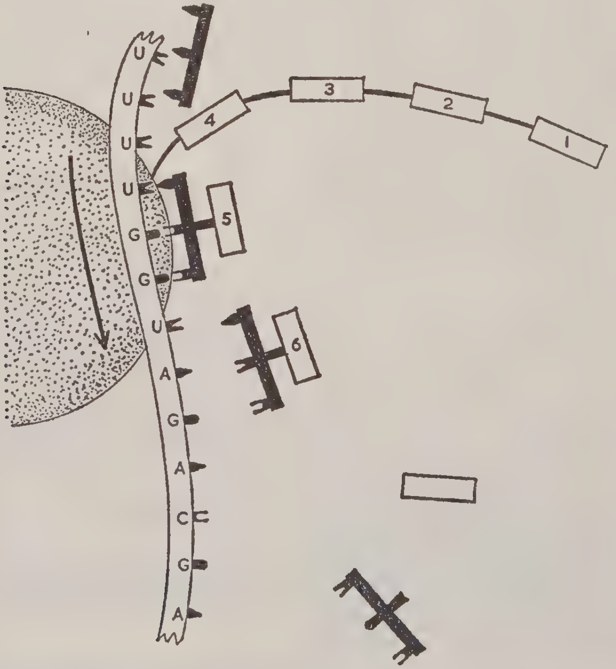

FIG. 2. A portion of a molecule of messenger RNA, associated with a ribosome and synthesising a protein. The bas sequence on the messenger RNA has been determined by the helix labelled with the downward pointing arrow in Fig. 3 Adenine specifies Uracil (U), Cytosine specifies Guanine (G), Thymine specifies Adenine (A), aud Guanine specifie Cytosine (C). The ribosome is moving down the messenger RNA strand "reading" the triplet code. Amino acid 4, which is phenylalanine specified by UUU, has just been joined to three other amino acids and its carrie RNA released to the cytoplasm. Amino acid 5, tryptophan specified by UGG, is attached to its carrier RNA an in position ready to be joined to the protein chain by the ribosome. Amino acid 6, methionine specified by UAG is attached to its carrier RNA but has not been brought into position on the messenger RNA strand. Other amino acids and carrier RNA molecules exist free in the cytoplasm and have not yet associated.

ned to the phenylalanine. In this way complex otein molecules can be built up according to tructions emanating from the nucleus for each the 20 different amino acids. It is far from ar how the amino acids in the cytoplasm are ought into position on the RNA "template" d how they are activated so as to combine and m protein. It is thought that they are first tached, by appropriate enzymes, to small moleles of so-called carrier RNA in the cytoplasm fore associating on the template of messenger NA. The association is then accomplished by a osome which moves along the messenger RNA ain, as it were "reading" the code, and taking propriate carrier RNA-amino acid complexes m the surrounding medium. There are still any gaps in our knowledge of the exact sequence events.

This system is responsible for building and intaining much of the organisation of the toplasm. All the enzymes, for example, talysing every reaction within the cell will be ecified and built up on the appropriate RNA nplate. The understanding of protein synthesis of fundamental importance to the whole of ology and has particular significance in studies cancer where cell growth becomes abnormal.

The Golgi Apparatus.

The characteristic features of the Golgi appara- are numbers of large vacuoles or spaces, rdered by closely packed layers of double embranes. The latter look very much like the embranes of the endoplasmic reticulum but do t have the ribosome particles along their edge. ey are therefore known as "smooth" memanes in contrast to the "rough" membranes of doplasmic reticulum. The function of the lgi apparatus is not established though it may associated with secretory activity of the cell.

The Golgi apparatus has been the subject of ntroversy for many years and illustrates one of major difficulties in working at the molecular l level. The Golgi structure can only be seen rough the light and electron microscopes after cell has been through a number of preparative ges. Many biologists thought that the preration itself was responsible for creating the lgi apparatus and that nothing like the objects n would really exist in the living cell. Though re is now little doubt that the Golgi apparatus real constituent of the cytoplasm, the general blem of creating artefacts by the involved atment in many investigations remains a very l one.

Cell Membrane.

Though the cell membrane plays a most vital t in regulating what can enter and leave the , it remains rather poorly understood. It is ught to consist of a double layer of lipid molees with a layer of protein probably outside the d. Fairly large molecules seem to be able to etrate the membrane in relation to their fat bility, which would support the hypothesis of lipid framework. Small molecules and ions ear to penetrate in relation to their size, the aller ones getting through more readily than the ger. This suggests that pores of a certain size st in the membrane.

The cell membrane has mechanisms which can ve ions and other substances against concention differences either into or out of the cell. A microelectrode can be pushed into a cell and electrical potential of the inside determined h respect to the outside. In all the cells died so far there is a potential difference across membrane which is produced by the nonform distribution on either side of ions, partiarly those of sodium, potassium, and chloride. ough these potentials have been studied in nal and plant cells generally, they are best wn from the work on nerve cells where sudden nges in the membrane potential are the basis nerve impulses. A great deal is now known ut the mechanism whereby the potential nge, and thus the nerve impulse, is propagated n one end of a nerve to the other. The basic cess which produces the nerve impulse in any region of the nerve fibre has been shown to be a sudden increase in permeability of the membrane to sodium ions in that region. A problem of much interest is how such activity can be passed from one nerve to the next, that is to say how a change of potential in one cell membrane can be made to affect an adjacent cell membrane. Such a process is fundamental to the large collections of nerve cells which form the nervous systems of animals. Transmission takes place at a special region called a synapse and when an impulse reaches this region it causes the release of a small amount of chemical transmitter substance which diffuse to the membrane of the adjacent cell. There it combines with the membrane in such a way as to change its permeability to ions and so produce a nerve impulse in the second cell. A number of transmitter substances have now been identified and many of them are related chemically to tranquillisers and other drugs affecting the nervous system.

II. NUCLEUS

The main regions of the nucleus are the surrounding nuclear membrane, a mass of material known as chromatin, and a small sphere called the nucleolus. The nuclear membrane is a double structure very much like the membranes of the cell surface and endoplasmic reticulum. Suggestions have been made that these membranes are continuous at some regions within the cell. The status of chromatin was in doubt for many years. Light microscope studies reveal very little structure in the nucleus until the time when the cell is preparing for, and undergoing, division or mitosis. At this time a number of discrete double strands, the chromosomes, are revealed by virtue of their chromatin content—the material stains heavily with basic dyes.

Cell Division.

During division the chromosomes behave in regular and recognisable sequence. In the first stage called prophase they appear and at the same time the nuclear membrane breaks down. Next, in metaphase, the chromosomes become arranged across the equator of a splindle-shaped collection of fibrils which appears in the area formerly outlined by the nucleus. Then follows anaphase in which the two threads of each chromosome, the chromatids, move to opposite poles of the spindle. Finally in the last stage, telophase, nuclear membranes are formed round the two separate collections of chromosome material and the cytoplasm itself divides into two. Thus two cells are formed each containing the same number of chromosomes as the parent and the cells enter a period of rest, or interphase, between divisions. During interphase the chromatin material disappears and the possibility was considered of the chromosomes being assembled as a prelude to every cell division and then being dispersed in the nuclear sap afterwards.

This suggestion is in direct conflict with the view that chromosomes are the carriers of genes.

Genes.

These are the elements which contain all hereditary information and the medium whereby hereditary features are transmitted from one cell to the next, either in the same organism or from parents to offspring via the fertilised egg. Experiments indicated that the same genes always occupy the same position on chromosomes and this really demands a structural continuity through the life of the cell. The chromosomes undoubtedly persist, but it is still not certain why or how they change so as to become visible during division. One suggestion has been that the nucleic acids of which they are very largely made up condense during the period of prophase. In the resting nucleus the chromosomes may be much more swollen and occupy much of the nucleus.

The problem that has attracted the most attention and is possibly the most fundamental that biology has to offer is that of the nature of the genes. The important material of the genes is known to be desoxyribosenucleic acid (DNA), made up of nucleotides as is RNA, though in this case the bases are adenine, cytosine, guanine, and thymine. The DNA molecule is large and complex. Two long chains of nucleotides are known to coil round in a double helix with the pairs of bases on each helix directed towards one another and linked by means of hydrogen bonds (Fig. 3).

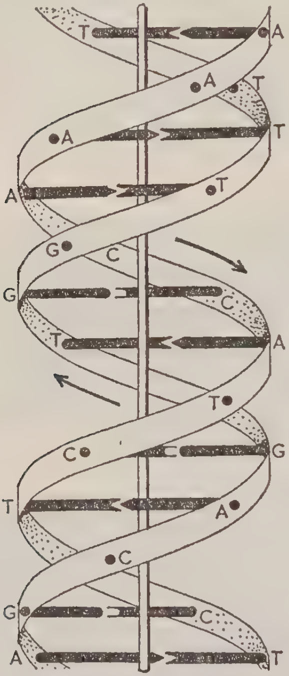

FIG. 3. The actual arrangement of the two nucleotide strands in a double helix, with the bases projecting and linking the two helices as shown.

Furthermore, if adenine is the base on one chain, thymine must be its partner on the other and similarly guanine can link only with cytosine. Because of this pairing off of bases there is sufficient information in a single chain of nucleotides to resynthesise the double helix once more. Thus if we examine a section of a single strand of the helix and find bases in the order adenine, thymine, guanine, adenine, cytosine, we can predict that in similar positions on the other strand we shall find thymine, adenine, cytosine, thymine, guanine. The capacity of one half of a DNA molecule to specify the other half exactly, enables the system to be self-replicating in a way that is essential in a hereditary transmitter and fits in well with what is known of chromosome behaviour during cell division.

Transmission of Genetic Information.

Accepting that DNA is the material of the gene it remains now to examine the nature of the information which it passes from cell to cell and organism to organism. Long before the structure and significance of the DNA molecule was known, geneticists were finding that alterations in a gene, known as a mutation, usually affected a particular chemical reaction and this in turn caused the changes seen in the organism as a whole. The effect was due to the failure to synthesise t necessary enzyme and so the hypothesis "on gene = one enzyme" gathered currency. Thi view has now been extended to include protein other than enzymes and it is now certain tha specific genes control the synthesis of specifi proteins. The DNA of the genes transmits th instructions about protein synthesis to th ribosomes via messenger RNA. In the nucleus messenger RNA is made with specific bas sequences in its molecule by using DNA as th template; thus a group of three adjacent adenin bases in DNA would produce a group of thre adjacent urocil bases in the synthesised RNA an this would lead to the specification of phenylala nine at the ribosome as we have seen. Only on of the two strands in the DNA double heli participates in the production of RNA.

Within the nucleus, the nucleolus is believed t play an important part in the synthesis of RNA since its turnover of this material is very rapid It has been suggested that the nucleolus supplements the RNA produced by chromosomes an acts as the channel through which this material i released to the cytoplasm. There is now som good evidence which points to the nucleolus as th source of ribosomal RNA since cells which los the nucleolus have no ribosomes.

The processes involved in nuclear control an the transmission of information from cell to cel is summarised in the aphorism "DNA make RNA and RNA makes protein." The system o carrying that information in the base sequences o DNA molecules has become known as the "geneti code."

MULTICELLULAR ORGANISATION.

It is axiomatic, if evolutionary theory i accepted, that in the course of very long periods o time there has been a general change in multicellular organisation from the simple aggregatio of cells with little individual differentiation, to th highly specialised and differentiated cells an tissues seen in complex animals and plants. It i fascinating to speculate on the environmenta variations and internal mechanisms which together produced this result. The problem is s vast, however, that a complete analysis is impossible and even a statement of the sequence o changes is in many cases highly controversial.

Another aspect of becoming multicellular where the problems offer more hope of analysis, i that the complex organisation must be built up i the lifetime of each animal or plant from the single celled stage of the fertilised egg. We have alread seen how cells can divide repeatedly, handing o self-replicating chromosomes so that each cell i apparently identical. If this were really so the division of the fertilised egg would result in a unorganised mass of cells showing no differentiation. The essential problems in developme are: (1) how is the smooth succession of shap changes produced during cell division so that a appropriate and recognisable end product i reached?; (2) how do the cells differentiate durin this temporal sequence so that those which form part of the eye, say, are different from those o liver and blood?

Method of Development.

There are some important differences in th method of development in animals and plants. I animals there tends to be a relatively short perio during which the basic structure is produced an after which growth, repair, and replacement ma cause adjustment rather than major change. I higher plants, on the other hand, the apica regions of both roots and shoots remain in permanently embryonic state and add materia which then differentiates, in a continuous proces throughout the life of the plant. In spite of thes differences—and in any case there are man exceptions—the two main problems in develo ment are essentially similar in both animals an plants.

A great deal of work has been done on anima development since this takes place in a fairl stereotyped way during a short period of tim The fertilised egg of an animal divides in such

ay as to form a hollow ball of cells, the blastula,
hich folds in on itself to produce a two-layered
c, the gastrula. A third layer, the mesoderm, is
ow added between the two layers, known as
toderm on the outside, and endoderm on the
side. At this stage much of the animal's basic
ructure is established. Many aspects of this
derly sequence can be explained in terms of
ecific adhesive properties of cells, so that a cell
ill stick to others of the same type but not to
nrelated types. Other mechanical properties
ch as elasticity, particularly in surface layers,
e important in maintaining shape and pro-
ucing appropriate changes during processes when
ne layer is folded in on another. Why cells
ould have the different physical properties
cessary to produce an integrated whole embryo
not known, but certainly it cannot be thought
at every cell has an absolutely fixed constitu-
on and therefore a predetermined role in develop-
ent. Large parts of developing embryos can be
moved in early stages and their places taken by
maining cells so that intact organisms are still
oduced. One is led to conclude that the sur-
undings of a cell have a great deal of influence
the way it reacts and that there is a great deal
adaptability in the developing system, especially
its early stages.

rmation of Specialised Tissues.

These points lead us on to the second major
estion concerning the differences which appear
ogressively in cells during development so that
ecialised tissues are ultimately formed. This is
sentially a problem in the regulation of gene
tivity since we know that each cell division
oduces daughter cells which are genetically
entical. It seems likely therefore that instruct-
s are carried on the chromosomes to cope with
requirements of the organism, but that in
ecialised cells only a small fraction of this full
tential is realised. For a long time embryolo-
ts have known that egg cytoplasm shows
gional differences which make identical nuclei
have differently, and it is thought that regional
toplasm can in some way control gene activity.
chniques for the transplantation of nuclei in
veloping frog embryos have been perfected and
has been possible to put a nucleus from an intest-
l cell of a tadpole into an enucleate egg. The
g will go on to develop normally even though its
cleus came from a fully specialised cell derived
m endoderm. The embryo will form blood
d muscle from the mesodermal layer and all the
er components of an organism, under the in-
ence of a nucleus which normally would have
oduced none of these things. One can conclude
t all the genes are present, even in the nuclei
specialised cells, but that they have to be
ced in a suitable cytoplasmic environment in
ler to be activated. Similar nuclear trans-
ntation experiments indicate that genes can
" turned off " as well as " turned on " by an
ropriate cytoplasmic environment, even
ugh the nuclei come from cells which are so
cialised as to stop dividing. The components
cytoplasm which control gene activity are still
ite unknown.

study of cell differentiation and the develop-
nt of multicellular organisation leads us to the
w that, important though the nucleus and its
es are in controlling cell activity, an integrated
anism is the result of complex interactions between its constituent cells and between the cytoplasm of those cells and their nuclei.

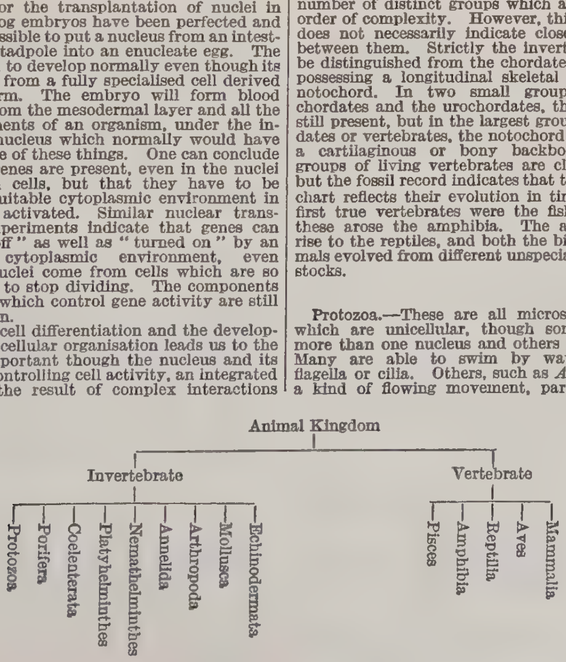
THE CLASSIFICATION OF ORGANISMS.

There are many uni-cellular, microscopic animals and plants, as well as thousands of multi-cellular ones of diverse kinds. The naming and classifying of this vast assemblage of living things has received the attention of man for centuries. At first the main interest was a practical one, to recognise those which were useful as food, fuel, and medicine and also those which were harmful or poisonous to human beings. With the exploration of the earth by Western man so many new types of animals and plants were found and brought back to Europe that a uniform system of naming and classification became imperative, and over the last 300 years such a system has been slowly built up. It was soon realised that some species were very similar and could be grouped together in what are now known as genera and that these could be grouped together into recognisable families and so on. With the general acceptance of Darwin's conception of evolution a new element was introduced into the problems of classification. Obviously a satisfactory classification of a group of organisms should reflect the past history or evolution of that group. Thus the aim of the present-day taxonomist who is concerned with such matters is to produce a natural classification based on phylogeny or true relationships. Our knowledge of this must always be incomplete, even if only because of the incompleteness of the geological record. Hence there is no finality in any proposed classification, which may have to be drastically modified as new facts about all aspects of living things are discovered.

CLASSIFICATION OF ANIMALS.

As indicated in the chart, the animal kingdom is usually divided into two groups, the invertebrates and the vertebrates. The former includes a number of distinct groups which are arranged in order of complexity. However, this arrangement does not necessarily indicate close relationships between them. Strictly the invertebrates are to be distinguished from the chordates, *i.e.*, animals possessing a longitudinal skeletal structure, the notochord. In two small groups, the hemichordates and the urochordates, this structure is still present, but in the largest group, the euchordates or vertebrates, the notochord is replaced by a cartilaginous or bony backbone. The five groups of living vertebrates are clearly distinct, but the fossil record indicates that the order in the chart reflects their evolution in time. Thus the first true vertebrates were the fishes, and from these arose the amphibia. The amphibia gave rise to the reptiles, and both the birds and mammals evolved from different unspecialised reptilian stocks.

Protozoa.—These are all microscopic animals which are unicellular, though some may have more than one nucleus and others form colonies. Many are able to swim by waving hair-like flagella or cilia. Others, such as *Amœba*, exhibit a kind of flowing movement, parts of the cell



]

putting out pseudopodia which are followed by the rest of the cell. Protozoa are found in all types of habitat, they are abundant in the soil and fresh-water, and many of the most beautiful forms occur in the floating plankton of the seas. Others are important diseases of man, and include *Trypanosoma*, which causes sleeping sickness, and *Plasmodium* the malarial parasite.

Porifera.—The sponges are fixed, multicellular aquatic animals, most of which are marine. Basically a sponge consists of a central cavity surrounded by two layers of cells, although the body may be branched and plant-like in form. Between the two layers of cells is a thin, gelatinous tissue containing calcareous or siliceous spicules which may be fused to form a rigid skeleton. Water is drawn in through many inhalant apertures and is passed out of the single apical exhalant aperture. Minute food particles present in the water are ingested by the inner wall cells.

Cœlenterata.—These are aquatic animals with a two-layered wall surrounding a central cavity which has only a single opening. This mouth is often surrounded by tentacles which bear many specialised stinging cells. A few live in fresh water, such as the solitary *Hydra*, but most are marine. The corals are colonial, and the remains of their calcareous skeletons form the large reefs and atolls common in the Pacific Ocean. Other familiar members of this group are sea-anemones, jelly-fish, and the floating Portuguese-man-of-war.

Platyhelminthes.—These are the worms which have soft, bilaterally symmetrical, and usually flattened bodies. The body tissue originates from three embryonic cell layers, and no body cavity is present. Some have a mouth and digestive tract, but these may be absent, and there is no blood system. The group includes the small fresh-water, free-living flatworms and also internal parasites, such as the liver-fluke which attacks sheep and the tape-worms which live in the gut of dogs, poultry, and man.

Nemathelminthes.—The round worms may be microscopic or up to 2 ft. in length. The body is smooth and pointed at both ends and has a digestive tract but no body cavity or blood system. Although they can move actively, they are unable to progress in any direction. The round worms occur everywhere, in water, in soil, and some, such as *Ascaris*, are parasites in the gut of various animals.

Annelida.—These are the worms with segmented bodies. Due to this feature, waves of muscular contraction can occur along the length of the body, and directional movement is possible. Usually they have a digestive tract open at both ends, a body cavity, and a blood system. The group includes the common earthworm, *Lumbricus*, many marine worms, and the leeches.

Arthropoda.—This large group of animals has the general characters of the annelids, but there is usually a hard exoskeleton, each segment bears a pair of appendages which may have various functions, and the blood is contained in the body cavity. Further, they possess a simple " brain " at the front end of the body. The most important classes are:

Crustacea.—Mostly true aquatics which have two pairs of antennæ. Included here are the crabs, shrimps, wood-lice, water-fleas, and the sedentary barnacles.

Myriapoda.—These are the millepedes and centipedes which have only one pair of antennæ and numerous pairs of legs.

Insecta.—This is the largest of all animal groups with over 100,000 species. The body has a head bearing one pair of antennæ, a thorax of three segments, each bearing a pair of legs, and an abdomen. Usually the adult possesses wings. Cockroaches, locusts, grasshoppers, earwigs, lice, dragon-flies, aphids, moths, butterflies, beetles, flies, bees, wasps, and ants all belong to this vast group.

Arachnida.—These are mostly terrestrial, air-breathing forms with no antennæ and four pairs of legs, such as the scorpions, spiders, and mites.

Mollusca.—The molluscs are mostly aquatic and differ from the arthropods in having non-segmented bodies with restricted body-cavities. The exoskeleton is a shell. There are three important groups:

Lamellibranchiata.—These are the bi-valved shell-fish, such as the mussel, oyster, and scallop. The head is reduced, and no eyes are present.

Gasteropoda.—These molluscs are not symmetrical and possess a single shell. The head bears eyes and tentacles. Included here are the slugs, snails, limpets, and whelks.

Cephalopoda.—This is a group of highly specialised, free-swimming, marine molluscs which are bilaterally symmetrical. There is a definite head containing a brain and bearing a pair of large eyes similar to those of vertebrates. Cuttle-fish, the octopus, and the giant squids, which may reach 50 ft. in length and are the largest invertebrates known, are included here. The extinct Ammonites, the shells of which are commonly found in many rocks, were also cephalopods.

Echinodermata.—These marine invertebrates are all radially symmetrical and have a calcareous skeleton just beneath the surface. Included here are the star-fish, sea-urchins, and sea-cucumbers. The stalked, sedentary sea-lilies which inhabit the deep oceans are also echinoderms. They have a long geological history, and many extinct forms are known.

Pisces.—The fishes are all cold-blooded, aquatic, and possess gills by means of which they breathe. The body is covered with scales or spines and bears fins for balance and propulsion. The cartilaginous fishes, such as sharks, rays, and dogfish, have no bones in the skeleton, the gill-slits are exposed, and the skin is covered with many minute tooth-like spines. The much larger group of bony fishes have bony skeletons, the gill-slits are covered by a flap of tissue, and the body is covered with flat, overlapping scales. Many fossil fishes are known from as far back as the Silurian period.

Amphibia.—These are cold-blooded vertebrates which have to return to water for breeding. They show various advances over the fishes. Pentadactyl limbs are usually present, and the skull is jointed at its connection with the vertebral column so that the head can be moved. The eggs, which are laid in water, have no hard shell and hatch into a larval form with external feathery gills. With rare exceptions a metamorphosis takes place, the larva gradually changing into the adult, which possesses lungs. The skin of the adult is usually naked and may be important in assisting respiration. The class includes the newts and salamanders, which possess tails, and the frogs and toads, which have no tails in the adult.

Reptilia.—The reptiles were the first vertebrates to become truly land animals. They are cold-blooded but have a more completely bony skeleton and more highly organised blood system than the amphibia. The egg contains much food material, which supports the developing embryo, and there is no larval stage. The present-day reptiles, snakes, lizards, turtles, tortoises, crocodiles, and alligators are much smaller and far less numerous than those of the Mesozoic.

Aves.—The only diagnostic feature of birds is e possession of feathers, although the presence scales on the legs, the structure of the skull, and e laying of eggs with shells are characters which dicate a reptilian ancestry. However, they ow many specialised adaptations to the habit of ght. The fore-limbs are developed as wings for pping and gliding, and the skeleton is rigid and ht, with air cavities in the bones. The body is mpact and streamlined and the weight is ntralised beneath the wings. As there is no adder and the rectum is short, waste materials e not retained and the weight is thereby further duced. The power necessary for flight requires high metabolic rate, the maintenance of which assisted by a large heart with a high rate of ating, a very efficient respiratory system, and a nstant body temperature of 38–42° C. The ,000 or more species of birds can be divided into e perching birds, which include many of our ng birds, those which scratch for their food, ch as the pheasant, the waders, such as the ng-legged stork and heron, the swimming birds, hich include gulls, ducks, and geese, and finally, e large flightless birds, such as the emu and trich.

Mammalia.—The mammals are the dominant nd animals of the present time. They are arm-blooded and have a glandular skin bearing irs. The body cavity is divided into thorax d abdomen by a muscular diaphragm, the rmer containing the lungs and heart, which is mpletely divided into four chambers. The red rpuscles of the blood have no nuclei. The ear divided into three regions, the middle ear con- ining three small bones. They all possess ammary glands with which they suckle their ung. In the largest group of mammals, the *ıtheria*, the young develop within the uterus of e female and are born at an advanced stage. the small group of marsupials of Australia and ntral and South America, such as the kangaroos d opossums, the young are born at an early stage d transferred to a pouch round the mammary ands, where they remain for a considerable ne. There are also two species of monotreme ammals, the duck-billed platypus (*Ornitho- ynchus*) and spiny ant-eater (*Echidna*) of ustralia, which lay eggs. It is impossible in the ace available to describe the vast range of therian mammals, but the main orders may be iefly referred to as follows:

Edentata.—The American sloths, ant-eaters, and madillos, which are mostly insectivorous and ve incomplete dentition.

Cetacea.—These are the entirely aquatic whales, rpoises, and dolphins, which are fish-like in rm and have no hind-limbs.

Ungulata.—A large group of hoofed mammals, st of which can run quickly on land. It in- des the herbivorous pigs, sheep, antelopes, er, camels, and giraffes.

Carnivores.—These are mostly carnivorous, have en hearing, sight, and smell, and have sharp eth and claws for killing and tearing their prey. e cats, dogs, bears, hyenas, and also the aquatic ls, sea-lions, and walruses belong to this group.

Rodentia.—The rodents are a highly successful rld-wide group characterised by the possession long, sharp, incisor teeth which are used for awing. The mouse, rat, squirrel, and rabbit examples.

Insectivora.—Small, carnivorous, mostly noc- nal mammals, such as the shrews, hedgehogs, d moles.

Cheiroptera.—The bats are truly aerial mammals ich have many of the adaptations to flight nd in birds. The wings are, however, sheets skin stretching between the fingers of the fore- bs.

Primates.—Mainly arboreal, with opposable mb and big toe for climbing. Nails instead of claws are present at the end of the digits. They have stereoscopic vision, which is important for judging distances when jumping. The brain is well developed. The primates include the small primitive lemurs, monkeys, the anthropoid apes, such as the chimpanzee, and man, *Homo sapiens*.

THE PHYSIOLOGY OF ANIMALS.

Some basic features of the physiology of cells have already been dealt with, and in unicellular animals all life processes, such as respiration, movement, growth, and reproduction, are carried on by one and the same cell. However, in multicellular animals cells are of various types, constituting distinct tissues and organs which perform special functions in the body. Although each living cell has its own complex metabolism under control of its own nucleus, there must also be co-ordination between all cells of an organism for the efficient functioning of the body as a whole. In the space available it is impossible to deal fully with all the physiological aspects of living animals, but an attempt will be made to compare some of the processes in different groups.

Feeding and Digestion.—All animals must take in and digest food materials. As well as water they require complex organic substances, proteins, fats, and carbohydrates, together with small amounts of various salts and vitamins. The insoluble organic substances are obtained from the dead bodies of other animals and plants. These must first be taken into the body and there broken down or digested by enzyme action into simpler, soluble substances. Proteins are broken down to their constituent amino-acids, insoluble carbohydrates to sugars, and fats to fatty acids and glycine. These soluble substances are then absorbed and distributed to various parts of the body where they are required, or stored for future use. Finally, the unused parts of the food are released from the body.

Diversity of Digestive Systems.—Many animals, called macrophagous feeders, take in relatively large masses of food at intervals of time. Some, such as frogs, fish, and snakes, swallow their food whole, but many break it up first. Most crustacea have appendages with which the food is torn, biting insects have cutting mouth parts, molluscs have rasp-like radulae which are used to scrape off small particles of food, and many mammals break up their food with strong jaws and teeth. In contrast, microphagous feeders collect small food particles continuously and are generally sedentary aquatic animals. They possess cilia which set up water currents from which minute food particles are filtered out, *e.g.*, lamellibranchs. A few animals, *e.g.*, *Lumbricus*, are detritus feeders which take in large quantities of soil or mud. Finally, some take in only soluble food materials. These fluid feeders include internal parasites which absorb dissolved substances over the whole surface of the body, *e.g.*, tape-worms, and insects with sucking mouth parts, *e.g.*, aphids.

Amoeba feeds by flowing around food particles, which are thus digested intra-cellularly. This type of digestion is common in the protozoa and in the amoeboid feeding cells which occur on the inner wall of the body cavity in coelenterates. Most other animals have a gut or alimentary canal in which nearly all digestion takes place extracellularly. This canal is basically a tube with the mouth at the anterior end and an anus at the posterior end. Food is taken in through the mouth and forced along by peristaltic action—waves of contraction of the muscles of the gut wall. Generally there is a digesting region, the stomach, and farther along an absorbing region the intestine. In worms the gut is more or less a straight tube, but in higher invertebrates it is more complex, is often coiled or twisted, and possesses diverticula which may have special functions.

In most vertebrates there is an oesophagus or delivery tube between the mouth and the stomach. Birds have an enlarged oesophagus or crop in which the food is stored before it is passed into a two-chambered stomach. The first chamber has a soft glandular wall which secretes digestive enzymes. The second chamber or gizzard has a hard muscular wall and contains stones, and it is here that the food is crushed.

Complex Digestive Systems of Mammals.—The most complex alimentary systems are found in the mammals, although much variation occurs, which can often be related to the type of diet. The carnivors have well-developed canine teeth with which the flesh of the prey is torn, and seals and sea-lions have very sharp teeth which can grip the slippery fish on which these animals feed. Rodents gnaw with their chisel-like incisor teeth, which continue to grow as they are worn away, and herbivorous ungulates have flat grinding teeth, which break up hard plant material. Some whales have no teeth, but, instead, numerous fringed plates of whalebone hang from either side of the palate. Large quantities of water are taken into the open mouth and then forced out again between the plates by the tongue. The plates form a sieve which traps the small organisms called " krill " on which the whale feeds.

In most mammals digestion of starch begins in the mouth under alkaline conditions. When the masticated food reaches the stomach proteins are broken down by enzymes which work under acid conditions. Usually the stomach is a simple curved chamber, but in ruminants such as sheep and cattle it has four chambers. The food is passed down the oesophagus and stored in the paunch. In the second chamber it is rolled into small masses or cuds which are passed up to the mouth and chewed again. When the cuds are swallowed again they enter a third chamber, and from here pass to the fourth chamber, in which the main digestion begins.

From the stomach the food enters the duodenum, in which digestion is completed. Enzymes from the pancreas continue the breakdown of carbohydrates and others digest fats. The simple soluble substances are absorbed through the walls of the long, coiled small intestine, which is richly supplied with blood vessels. In herbivorous rodents, such as the rabbit, there is a large side branch at the end of the small intestine. This is the caecum and appendix in which cellulose is digested. In carnivorous animals and man the caecum and appendix are very reduced and of doubtful function. In the colon water is removed and the waste materials are temporarily stored in the rectum before being eliminated from the body.

Respiration.—Basically respiration involves the absorption of oxygen from the environment and the oxidation of organic substances, such as sugars, resulting in the release of energy and the formation of waste carbon dioxide. All living cells respire and remain alive only if supplied with oxygen. Hence in all animals there must be an efficient respiratory system by which oxygen can be taken up and carbon dioxide released and also a circulatory system by which the oxygen is transported all over the body.

Gaseous Exchange.—In protozoa and most simple aquatic animals gaseous exchange takes place through the whole body surface. Most worms also have no special respiratory organs and are either aquatic or live in very wet surroundings. The entire body surface of *Lumbricus* secretes moisture, and atmospheric oxygen dissolves in this and is then absorbed in solution. Most molluscs are aquatic and possess gills or ctenidia contained in a mantle cavity. The gills are ciliated, and a continuous stream of water passes through the mantle cavity. Although they are primarily feeding structures, the gills are richly supplied with blood vessels and they take up dissolved oxygen from the water. In terrestrial molluscs, such as slugs and snails, the gills are reduced and the mantle cavity itself acts as a simple lung. The smaller crustacea absorb oxygen all over the body surface, but in most the thoracic appendages bear feathery gills. Continuous water currents are drawn forwards through these, and gaseous exchange takes place. In contrast, most air-breathing insects and arachnids have a system of tracheae, which are branched tubes ramifying throughout the body. They open to the exterior by lateral spiracles, and gaseous exchange takes place in the tracheoles, which terminate the ultimate branches of the tracheae.

Breathing Apparatus of Fish and Amphibia.—The respiratory systems of vertebrates are specialised parts of the anterior region of the gut. Fish have five to seven pairs of lateral gill slits, which in the bony members are covered by an operculum. Water is drawn into the mouth when its floor is lowered. Then the mouth is shut and the floor raised, thus forcing the water through the gill slits. A small group of fish, the *Dipnoi*, have simple lungs which are branches from the lower side of the oesophagus and air is forced into these by the mouth. Many bony fish also have a similar air sac which may be connected to the oesophagus, but this is a hydrostatic organ and is not used in respiration. The aquatic larvae of amphibia have external gills, but the adults usually have lungs. Air is forced into these when the floor of the mouth is raised with the mouth and nostrils shut. The moist, naked skin also allows a certain amount of surface respiration in amphibia.

Complex Breathing Systems.—Respiration is more efficient in the other vertebrate groups, as the volume of the lungs is changed by movement of the ribs, which form a box around the lungs. This is assisted in mammals by the diaphragm, a sheet of muscle which lies beneath the lungs and separates the thorax and abdomen. The lungs are spongy masses of tissue with many small air spaces, and in mammals the internal surface area may be thirty times that of the external surface of the body. The presence of nostrils and a false palate enables the animal to breathe when the mouth is full of food. Associated with the high development of a respiratory system is the formation of a sound-producing organ, the larynx and vocal chords in mammals and the syrinx at the base of the trachea in birds.

Blood Systems.—In the simpler animals there is no blood system, and the dissolved oxygen and nutrients move about the body solely by diffusion, assisted to a certain extent by streaming movements of protoplasm within the cells. Annelids have a well-developed blood system, which consists of dorsal and ventral longitudinal tubes from which capillaries supply the various organs. The blood may be pumped round the system by contractions of the dorsal vessel, but in *Lumbricus* there are five pairs of muscular, contractile " hearts." In some of the burrowing polychaete worms there is a definite two-chambered heart with an auricle into which the blood enters and a pulsating ventricle which pumps the blood round again. The mulluscs also have hearts, but these often have two auricles and a single ventricle. The heart in arthropoda consists of the long dorsal blood vessel which forces the blood along arteries. These discharge the blood into sinuses, which are cavities surrounding the various organs. From here the blood collects in the pericardial sinus surrounding the heart. The blood passes back into the heart *via* lateral perforations or ostia. Thus in the arthropoda there are no blood capillaries and the system is described as an " open " one.

Vascular System of Vertebrates.—The vascular system of vertebrates is fairly uniform, the basic pattern being very evident in fishes. They have a heart with a single auricle and a ventricle from which blood is pumped *via* arteries to the gills, where it becomes oxygenated. The blood is collected in the dorsal aorta, from which branches supply all parts of the body. The deoxygenated blood collects in veins and eventually passes into the auricle again. One vein, the hepatic portal, runs from the intestine to the liver, where it breaks up again into capillaries. It is here that much of the digested food absorbed from the intestine is stored.

The main differences encountered in the other vertebrate groups are related to the presence of lungs instead of gills in the adult. In amphibia there are two auricles, and oxygenated blood urns to the left one from the lungs *via* the lmonary veins. Oxygenated blood from the in, together with de-oxygenated blood from the st of the body, enters the right auricle. The ood passes from both auricles to the ventricle, which it is pumped into the arterial system and o the pulmonary arteries to the lungs. Thus the amphibia the separation of arterial and nous blood is incomplete. In most reptiles the ntricle is partly divided by a septum, and the nous blood from the right auricle enters the ht side of the ventricle and is pumped to the ngs along the pulmonary arteries. The oxy- nated blood from the lungs passes from the left ricle to the left side of the ventricle and thence o the arterial system. In the crocodiles and e warm-blooded birds and mammals the rtitioning of the ventricle is complete. All nous blood enters the right auricle and is mped to the lungs by the right ventricle. The ygenated blood returns to the left auricle and is rced into the arterial system by the left ven- cle. Thus, in these animals with a four- ambered heart there is complete separation of ygenated and de-oxygenated blood.

Function of the Blood.—The blood itself is re- onsible for the transport of food materials and ygen throughout the body. The nutrients are ssolved in the fluid or plasma, but oxygen is tually combined with a carrier in the blood. In ost annelids this is red haemoglobin which is ssolved in the plasma, but in some of the burrow- forms it is haemerythrin contained in separate lls, the corpuscles, which are carried along in the ood stream. Crustacea and some molluscs ssess blue haemocyanin as an oxygen carrier dis- lved in the blood plasma. All vertebrates ssess haemoglobin in minute disc-like red cor- scles. The blood also transports other sub- nces about the body, such as hormones secreted various glands, carbon dioxide to the lungs, and ste nitrogenous materials to the kidneys. Also esent in the blood are various types of white cor- scles which are part of the defence mechanism of e body. Some ingest invading bacteria, while ners produce antitoxins which counteract the isonous substances excreted by the bacteria.

Nervous Systems.—All animals are capable of ntrolling their own bodies and responding to ternal stimuli. In the worms and higher groups ntrol and response is mainly due to the presence a nerve system. This consists of many cells or urons, each of which has a number of short, n, branched dendrites and a long axon sur- unded by sheath cells. The axons may be out 1 mm. long or may extend several feet, as ne do in large mammals. It is along these that rve impulses travel. The neurons are grouped gether to form nerves, and in some places nglia or swellings are formed. They may also massed together to form a definite brain and nal cord.

The segmented invertebrates usually have a uble, ventral, solid nerve cord lying beneath the , with a pair of ganglia in each segment. There also a nerve ring round the oesophagus with a ir of cerebral ganglia above. These may be well veloped in some arthropods and constitute a mitive brain. The molluscs also have a ventral rve cord and a ring with ganglia round the ophagus. This is particularly well developed the cephalopods, such as *Sepia*, which has a in comparable with that of the vertebrates.

Vertebrates.—The central nervous system of tebrates is a hollow dorsal tube with an anterior in protected by the skull and a backward exten- n, the spinal cord, enclosed in the vertebrae of spinal column. The development of a brain is ociated with the formation of a head with sense ans at the front end of the body. Masses of rons form the nerve centres or grey matter of brain and spinal cord. Surrounding and con- ting these are millions of nerve fibres constitut- the white matter. The cranial and spinal ves which are given off by the central nervous tem are composed entirely of axons. Close to point where a spinal nerve joins the central vous system the nerve fibres are grouped into two separate bundles or roots. The dorsal root contains the sensory fibres, which convey impulses to the brain. The ventral root contains the motor fibres, which convey impulses from the brain to the various muscles, etc. The sensory component of the nervous system can be further divided into: (*a*) *somatic*, which conveys impulses from the skin sense organs (exteroceptors) or from the muscles indicating their condition (proprioceptors); and (*b*) *visceral* which carries impulses from the mucous surfaces of the viscera (interoceptors). Thus the central nervous system receives information about both the internal and external environment of the body. The motor system can also be divided into components: (*a*) *general visceral*, which conveys impulses to the non-striated muscles and glands of the viscera, the blood vessels and iris of the eye; (*b*) *special visceral*, which supplies the voluntary striated muscles of the jaws; and (*c*) *general somatic*, which innervates all the other striated muscles of the body.

All these ingoing and outgoing impulses are controlled by the central nervous system. The simplest type of nervous behaviour occurs in reflex actions. If a finger is put on a hot plate an impulse is sent to the spinal cord. An impulse is then sent directly *via* a motor nerve to the arm muscles, which move in response, and the finger is rapidly withdrawn from the plate. Such an action is involuntary and rigid. However, a single sensory fibre makes a large number of connections with other neurons in the spinal cord and brain. These may be motor fibres connected to various effectors or neurons which carry impulses to other parts of the central system. Further, the neurons of the central nervous system are not rigidly fused, but can make new synaptic connections with each other. Thus the combinations between receptors and effectors are limitless, and the brain and spinal cord act as a flexible co-ordinating system.

The Brain.—The brain itself can be divided into three regions related basically to different sense organs: (*a*) the fore-brain (nose); (*b*) the mid-brain (eye); and (*c*) the hind-brain (ear, taste, skin). These primary centres constitute nearly the whole of the brain in fish. There is little co-ordination between these, and the behaviour of fish is mostly a series of reflex actions without much variation or modification by experience. The most important correlation centre in fish is the cerebellum in the roof of the hind-brain, which regulates the posture and movement of the body. In birds it is the floor of the fore-brain, the corpus striatum, which is well developed. This correlates reactions and movements of instinctive behaviour which are so evident in the complex life routine of many birds. In mammals it is the roof of the fore-brain, the cerebrum, which is so well developed. It deals with impulses from the sense organs, which remain separate until final co-ordination. The cerebrum judges which of many responses to make to a particular set of impulses. Thus arbitration and hesitancy in behaviour are involved. Further, impressions gained from experience are stored or learnt, and the use of this stored experience to decide on the response to a given set of stimuli results in intelligent behaviour. The cerebrum is most developed in man, and it has been estimated that there are 10 million neurons in the human cerebral cortex.

Reproduction.—A single animal may live for a short or long time, but eventually it dies, and the continuance of the species is dependent upon reproduction. Some protozoa, such as *Amoeba*, reproduce asexually by the simple division of the cell to produce two new individuals. Asexual reproduction also occurs in some coelenterates, such as jelly-fish, in which there is an alternation of sexual and asexual generations. However, the vast majority of animals only reproduce sexually. This involves the fusion of two cells, the gametes, produced by adult individuals, and each zygote thus formed develops into an individual of the next generation. The gametes are of two kinds, the large, spherical, immobile ova produced by the female gonad or ovary and the much smaller motile sperms produced by the male gonad or testis. The motility of the sperms helps them to reach the passive ovum, which contains food reserves to support the early development of the embryo.

Worms.—The flat worms, particularly parasitic forms, have complicated life cycles, and many are hermaphrodite, *i.e.*, each individual has both male and female organs. Cross-fertilisation usually occurs, the sperms from one worm being introduced into the female duct of another. The round worms are unisexual, and internal fertilisation also occurs. Of the annelids the polychaete worms are unisexual, but the ova and sperms are shed into the sea, where fertilisation takes place. However, *Lumbricus* and the leeches are hermaphrodite, cross-fertilisation takes place and the eggs are laid in cocoons.

Arthropods.—Many crustacea are unisexual, though the sedentary barnacles are hermaphrodite. Internal fertilisation may occur, but in the crabs and crayfish pairing takes place and the sperms are deposited on the tail of the female. When the eggs are shed they become fertilised and remain attached to the abdominal appendages. Most crustacea have motile larval stages into which the eggs first develop. In *Daphnia*, the water-flea, parthenogenesis sometimes occurs, *i.e.*, the eggs develop without being fertilised. The sexes are separate in the arachnida and there are usually no larval stages except in the primitive king-crabs. The insects are also unisexual, and the fertilised eggs are laid after copulation. In some, *e.g.*,dragon-flies, an immature nymph similar to the adult is formed, but in flies, beetles, moths, and many others the egg hatches into a larval form. This then develops into a pupa, from which the final adult or imago is produced. In the social ant's nest the workers are sterile females with large heads, reduced eyes, and no wings. The males and queens are winged, and insemination of the latter occurs during the "nuptial" flight.

Molluscs and Echinoderms.—Most lamellibranchs are unisexual, although some species of scallops and oysters are hermaphrodite. There are motile larval forms, and in the swan mussel, *Anodonta*, the larvae develop in the mantle cavity of the parent and when liberated become attached to the gills or fins of fish, where they remain parasitic for some time. Some gasteropods are unisexual, but the slugs and snails are hermaphrodite. In the latter cross-fertilisation occurs, the two approaching snails being stimulated to copulate by firing small sharp darts of calcium carbonate into each other. The echinoderms are unisexual, and fertilisation takes place in the sea. The egg first develops into a ciliated larval form.

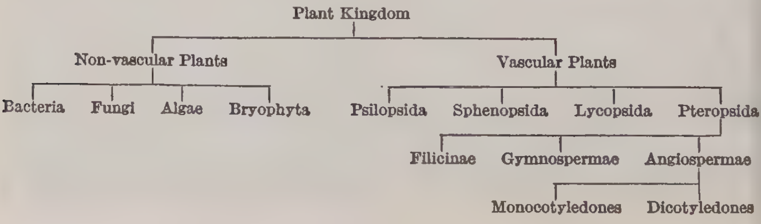
Vertebrates.—The sexes are always separate in the vertebrates. In some cartilaginous fish, *e.g.*, dogfish, internal fertilisation occurs and the eggs are laid in protective sacs. In contrast, the bony fish shed ova and sperms into the water, where fertilisation takes place. Although pairing may take place in the amphibia, fertilisation occurs in water, and there is usually an aquatic larval stage. The reptiles, birds, and mammals are independent of water for fertilisation, as copulation takes place and the sperms from the male are introduced directly into the female. Most reptiles and all birds lay eggs with hard shells. Development of the embryo in marsupial mammals begins in the female uterus, but is continued in a ventral pouch which surrounds the teat of the mammary gland. In the two living species of monotreme mammals the eggs are incubated in a similar pouch. Finally, in the eutherian mammals the embryo develops in the female uterus and is born at an advanced stage.

Diversity of Sexual Reproduction.— This brief survey will give some idea of the diversity of sexual reproduction in animals. External fertilisation is very much a matter of chance, and large numbers of gametes are produced which offset the great losses of gametes and embryos that this method involves. Internal fertilisation is more certain, and is also independent of external water—an important factor in land animals. In vertebrates particularly there is increase in the care of the young by the parents, involving the development of characters of behaviour as well as those of structure. Some fish lay their eggs in holes or nests which are protected by the male. Similarly, a few frogs build nests, while others carry the eggs about. The eggs of birds require a constant high temperature for their development, and they are usually incubated by the parents. After hatching the young are fed and guarded by the parents until they can leave the nest and fend for themselves. In the eutherian mammals the embryos are attached to the uterus wall by the placenta, *via* which food materials pass from the mother. The period of gestation is long, and after birth the young are supplied with milk from the mother until they are weaned and can feed themselves. Another feature in mammals is the period of "childhood" during which they play and learn and are protected and fed by their parents. The internal fertilisation, internal development, and care and protection of the young after birth which is so conspicuous in the higher vertebrates results in the reduction of losses during the vulnerable embryonic and young stages, and in consequence relatively few progeny are produced by a pair of individuals.

CLASSIFICATION OF PLANTS.

There are various ways in which the main classes of the plant kingdom can be grouped, but a simple, up-to-date arrangement is given in the chart. Vascular plants are often known as the *Tracheophyta* because they all possess woody conducting elements. These are absent in non-vascular plants, and the bacteria, fungi, and algae are often called *Thallophyta*, *i.e.*, they have a relatively simple plant body or thallus. Many of the bryophytes also possess a thallus, but in some there is a stem bearing leaves, although a true vascular system is absent. Many thallophytes are aquatic, whereas the tracheophytes are mostly land plants in which the development of woody tissues can be related to the attainment of the land habit as the plant kingdom evolved. However, the chart should not be taken as indicating the evolutionary relationships of the various groups. It is more a convenient arrangement which reflects the relative complexity of the plant body.

Bacteria.—This is a vast group of minute organisms of very simple structure. They are spherical or rod shaped and may exist as separate cells, some species being motile, or as long chains or irregular masses. Their minute size makes the elucidation of their structure very difficult. There is a wall of complex composition, and cytoplasm which contains glycogen and fat. Electron-microscope studies have revealed the presence of structures which appear to consist of nuclear material. Multiplication is by simple division,



hich may take place very rapidly. For example, *acillus subtilis* can divide every 20 minutes, so at in 8 hours a single cell may give rise to millions. Recent research indicates that a xual process may also occur. Bacteria can sur-ve unfavourable conditions by producing a sistant spore within the cell. They do not ssess chlorophyll, though a few are pigmented. ost obtain their food already formed, and are us either saprophytes or parasites. The prophytic bacteria occupy a vital position in the ing world. They are responsible for most of e decay of dead organic matter, and it has been ly said that without them the surface of the rth would soon become completely covered with e dead bodies of animals and plants. Bacteria so play a vital part in the circulation of nitrogen nature. By breaking down organic material, monia is released and ammonium carbonate is rmed in the soil. This is oxidised by other cteria to form nitrates, which can be absorbed plants again. Yet other bacteria can "fix" mospheric nitrogen, and one species, *Rhizobium uminosum*, occurs in the root nodules of plants ch as clover and lupins. These plants are often own on poor soils and ploughed in, thus im-oving the fertility of the soil. The parasitic cteria are also of great importance, as they are sponsible for many diseases of plants, animals, d man. (*See* **P7(1)**.)

Fungi.—This is a large group of plants, none of hich contain chlorophyll. Hence, like the cteria, they are either parasites on other living ants and animals or saprophytes which live on ad organic matter. Some are unicellular uatic plants, but many have a body called a ycelium composed of many branched threads or phæ. In the higher fungi (*e.g.*, toadstools, acket fungi, and puff-balls) complex reproduc-re structures are formed. All fungi produce ores. In the aquatic species these may be otile, but the majority form minute, airborne ores. The spore output is often very great, d a single mushroom may produce 1,800 million ores. Some fungi are serious diseases of crop ants, such as potato blight and wheat rust.

Algæ.—These are essentially aquatic plants hich contain chlorophyll. They range from croscopic forms to the large seaweeds. The een algæ (*Chlorophyceæ*) live mostly in fresh ter and may be unicellular, motile or non-otile, or filamentous, though a few found in opical seas are more complex. The brown gæ (*Phæophyceæ*) are mostly seaweeds which ssess a brown pigment, fucoxanthin, which asks the green chlorophyll. They include the adder-wracks (*Fucus*) and kelps (*Laminaria*) of r coasts and the seaweeds which form dense ating masses over hundreds of square miles of e Sargasso Sea. Other groups are the red algæ *hodophyceæ*), mostly seaweeds of delicate form, e unicellular motile diatoms (*Bacillariophyceæ*), d the blue-green algæ (*Cyanophyceæ*). All gæ possess unicellular reproductive organs. rious types of life cycle occur, the most complex ing found in the red algæ.

Bryophyta.—These are the liverworts (*Hepaticæ*) d the mosses (*Musci*). They are all small nts characterised by a sharply defined life-cle. This consists of an alternation of genera-ns, the "plant" being a gametophyte bearing organs. The latter are multicellular, the nale archegonium containing a single stationary um and the male antheridium producing many otile sperms. The latter are released and swim water to the archegonium, where fertilisation kes place. After this a sporophyte is formed ich is always dependent on the gametophyte d never becomes free living. The sporophyte ually consists of an absorbing foot buried in the sue of the gametophyte and a stalk or seta aring at the top a single sporangium. In many sses this is a complex structure with hygro-pic teeth which move apart only when dry, thus easing the minute spores only when conditions suitable for their dissemination in the air. The bryophytes are of little economic importance, and may be looked upon as an evolutionary sideline. However, they occupy suitable "niches" in many plant communities, and species of the bog-moss *Sphagnum* cover large areas where rainfall is high.

Psilopsida.—This is a small group of primitive, vascular, spore-bearing plants. Its only living representatives are two rare genera of the Southern Hemisphere. However, a number of fossil forms are known from the Devonian period. The best known are those found in the chert at Rhynie in Scotland. The plants are excellently preserved, and their internal structure can be easily seen. They were probably marsh plants with prostrate and erect leafless stems, although *Asteroxylon* had simple leaves.

Sphenopsida.—The only living members of this group are about twenty-five species of horsetails (*Equisetum*). In the Carboniferous period many tree forms existed (*e.g.*, *Calamites*), the remains of which are very common in coal deposits.

Lycopsida.—In the Carboniferous period the tree clubmosses were also prominent members of the forests (*e.g.*, *Lepidodendron*). They often reached 100 ft. in height, were branched or unbranched, and had large simple leaves. They also had extensive root systems. The only living members belong to a few genera of small herbaceous clubmosses, such as *Lycopodium* and *Selaginella*. Like the true mosses, they have an alternation of generations, but the elaborate plant with stem, leaves, and roots is the sporophyte, and the gametophyte is very small. In *Lycopodium* only one kind of spore is produced, and the resultant gametophyte is bisexual. *Selaginella* produces numerous small microspores which give rise to the very reduced male gametophytes and motile sperms and the few large megaspores which produce the female gametophytes. The latter are formed within the megaspore wall, which splits to allow the sperms to reach the small archegonia.

Filicinæ.—These are the true ferns, which in some classifications are put with the horsetails and clubmosses in the Pteridophyta or vascular cryptogams (*i.e.*, vascular plants without seeds). The ferns have a long fossil history, and remains very similar to the living Royal ferns (*Osmunda*) are known from the Carboniferous. The ferns are widespread and particularly abundant in tropical forests. The majority are herbaceous perennial plants, but a few are aquatic, and there are some tree ferns, which may reach 20 ft. in height. Most ferns possess a stem bearing roots and large leaves or fronds. The plant is the sporophyte and produces numerous spores in sporangia borne on the fronds. Each spore gives rise to a minute green free-living gametophyte known as the prothallus, which bears the archegonia and antheridia. After fertilisation a young sporophyte develops, which at first draws nourishment from the prothallus. Thus, as in the *Bryophyta*, external water is essential for the motile sperms to swim in, and there is a clearly defined alternation of generations, but the sporophyte is a complex independent plant, and the gametophyte is reduced though free-living.

Gymnospermæ.—These were the dominant land plants in the Mesozoic era, although fossil remains are found as far back as the Devonian. The living members still form large forests in the North Temperate regions. They are mostly tall evergreen trees with roots, stems, and small leaves. The conifers include the pines (*Pinus*), larches (*Larix*), and yews (*Taxus*). The cycads are a relic group of tropical plants with thick, unbranched trunks and large fern-like leaves. The maiden-hair tree of Japan (*Ginkgo biloba*) has also had a long geological history. Another interesting Gymnosperm is *Metasequoia*, a genus well known to palæobotanists. In 1948 a few living specimens were found in a remote area of China. Seeds were collected and plants are now being grown in botanical gardens all over the world. The Gymnosperms are characterised by the production of "naked" seeds, which are usually borne on cones. The male pollen grains, which are equivalent to the microspores of *Selaginella*, are carried by wind to the ovule of the female cone. The pollen germinates and the pollen tube carries the male gametes to the reduced archegonia borne on the female prothallus, which, unlike those of the ferns, is retained within the ovule on the parent plant. After fertilisation an embryo is formed, the prothallus becomes the food store or endosperm, and the outer part of the ovule becomes the seed coat. The cycads and *Ginkgo* retain a primitive feature in that the male gametes are motile and they swim to the archegonia from the pollen tube.

Angiospermæ.—The apparent sudden rise of the Angiosperms in the Cretaceous period is still the "abominable mystery" it was to Darwin. Various suggestions have been put forward, but nothing definite is known about the origin of the group. The Angiosperms or flowering plants are now the dominant group over most of the land surface of the earth, and at least 250,000 species are known. Apart from the natural vegetation, the majority of our crop and garden plants are Angiosperms. They occur in every type of habitat and range in form from gigantic trees to minute plants, such as the duck-weeds. Some are climbers, others succulents, and a number have reverted to the aquatic habit. Although most possess chlorophyll, a few are partial (*e.g.*, Mistletoe) or complete parasites (*e.g.*, Dodder).

Flower, Fruit and Seeds.—The diagnostic feature of the group is the production of seeds, which are completely enclosed within the female part of the flower, the ovary. Basically a flower is a short reproductive shoot which bears several whorls of lateral organs. At the base are several, often green, protective sepals forming the calyx, and above this are the often brightly coloured petals of the corolla. Within this are the stamens of the andrœcium or male part of the flower. Centrally is the female gynœcium of one or more carpels containing the ovules. The parts of the flower may be free, as in the buttercup, or fused together. In many species the petals are fused (sympetalous), the stamens are borne on the corolla (epipetalous), and the carpels are fused to form a compound gynœcium (syncarpous). The stamens possess anthers, which produce pollen grains. These are shed and carried by insects or wind to the receptive stigmas of the carpels. Each produces a tube which grows down the style to the ovary and enters an ovule. The ovule is a complex structure containing an ovum and a primary endosperm nucleus. Two male nuclei are discharged from the pollen tube, one fuses with the ovum and the other fuses with the primary endosperm nucleus. After this "double fertilisation" an embryo is formed which is embedded in the nutritive endosperm and the outer tissues of the ovule form the seed coat or testa. The ovary of the carpel develops into the fruit containing the seeds. Fruits are of various kinds, being either dehiscent and opening when mature to release the seeds or indehiscent, with a succulent or dry wall. The indehiscent fruits are shed as a whole, and often contain only a single seed. Seeds and fruits show great variation in structure, and often have adaptations assisting dispersal. Some have hairs or wings which aid wind dispersal, whereas others have hooks or are sticky and are transported by animals. Some have flotation devices and may be carried a great distance from the parent plant by water. Seeds vary in size from the microscopic seeds of orchids to those of the double coconut, which may weigh 40 lb. Only about 10% of the weight of a seed is water, and the embryo, although alive, is dormant. The bulk of a seed consists of stored food material, commonly fats or starch and proteins, which may be contained in the endosperm surrounding the embryo, although in some species the endosperm is absorbed during seed development and the food is stored in the one or two swollen seed leaves or cotyledons of the embryo.

Classification of Flowering Plants.— John Ray (1627–1705) was the first botanist to recognise the two great divisions of the Angiosperms—the dicotyledons with two seed leaves and the monocotyledons with only one. This primary division of the flowering plants has stood the test of time and is still recognised. Other differences are also found between the two groups. The dicotyledons usually have net-veined leaves and the floral parts are in fours or fives, whereas the monocotyledons usually have leaves with parallel veins and the floral parts are in threes.

THE GEOLOGICAL RECORD.

London is an old city as cities go, although not so old as Rome, but geologically speaking it is not so long since the land upon which London stands was beneath the sea. Later in time there were tropical jungles on the banks of the Thames in which sabre-toothed tigers hunted their prey, the Thames was a tributary of the Rhine, and, still more recently (in fact only yesterday on the geological time-scale), the great Ice Ages brought sub-arctic conditions to our land.

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify, and it is in these rocks, too, that the record of life upon earth may be traced.

No Life Rocks.—The earliest rocks in the record are known as the Azoic (no life) rocks, because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record. That is to say, for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or sand, swept by hot winds exceeding in violence the wildest tornadoes of today, and drenched by torrential downpours of tropical rain, which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1,500 million years ago.

Primitive Sea-life.—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age), when we find the fossilised remains of small shellfish, seaweeds, and trilobites—the latter were creatures somewhat like the plant-lice of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas; for as yet life had not invaded either the dry land or the deep oceans. It is, of course, clear that these creatures of Early Paleozoic times were not the first living things: they were merely the first creatures capable of leaving fossilised remains, and without doubt must have had more primitive ancestors—amœbic-like forms, jellyfish, bacteria, and so on whose bodies were too soft to leave any traces in the record of the rocks. This problem, however, will be discussed more fully later.

The Age of Fishes.—Towards the end of the Early Paleozoic Era, in what we now know as the Silurian period (see F33) there arose a new form of life: the first backboned animals, primitive fishes somewhat similar to the sharks of today and in the division of the Upper Paleozoic Era known as the Devonian, they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants.—It is abou this time, too, that we begin to find traces o animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live ou of water; for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the lution of an impermeable outer cuticle which vented water loss and also the development of ody tissues which provided support and a ter-conducting system for the whole plant body.

mphibia and Spore-bearing Trees.—The first e of vertebrates (backboned animals) to live n dry land was the group of amphibia in the boniferous Age, which is today represented the newts, frogs, toads, and salamanders. In hese forms the eggs give rise to a tadpole stage h gills which lives for some time entirely in er. Later the gills give place to a primitive n of lung which enables the animal to live n land. Even so, amphibia are restricted e or less to swampy or marshy land, and hout a damp environment they would dry up shrivel to death. The most abundant forms lant life in the Carboniferous period were the -like horsetails, clubmosses, and ferns, the lised tissues of which are found in the coal sures and are burned as household coal. But e plants also, as in the case of the amphibia, d exist only amongst the swamps and shes, and life, although it had freed itself from necessity of existence in the waters of the h, still had to return to the water in order to oduce itself. The highlands and the deeper ers of the planet were still empty of living gs. Although the Carboniferous period had a period of warmth and abundance, the ozoic Era came to an end with a long cycle ry and bitterly cold ages. Such long-term atic changes were due, it is now supposed, to factors as changes in the earth's orbit, the ing of its axis of rotation, changes in the shape e land masses, and so on. Long before the Ages of more recent times, there are records in rocks of alternating periods of warmth and as far back as the Azoic and Early Paleozoic . This long cold spell at the close of the ozoic era came to an end about 220 million s ago, and was succeeded by a long era of ly spread warm conditions—the Mesozoic the so-called Age of Reptiles.

THE GEOLOGICAL TIME SCALE.

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		Birds, Mammals and modern plants Molluscs
	Miocene	25	
	Oligocene		
	Eocene	70	
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads; Earliest Birds; Ammonites and Sea-urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals; Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insects
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals: no life on land. Trilobites and graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		2,000	Life emerges
		5,000	Age of Earth

e Mesozoic Era.—The reptiles first appeared e Permian, but it was during the Mesozoic that they became the dominant group of als. The giant reptiles included the stego- us, the gigantosaurus, the diplodocus, and other kinds which were far larger than any animals living today. Some, for example the docus, were 100 ft. long, although they were tarian in habit and were preyed upon by almost equally huge flesh-eating reptiles. e species, such as the plesiosaurs and icthyosaurs, became secondarily aquatic, while the pterodactyl possessed wings with which it could glide and perhaps fly short distances. However, they all differed from the amphibia in that they had hard, dry skins, their lungs were more efficient, fertilisation was internal due to the development of copulatory organs, and they laid eggs with hard, protective shells.

It was also during the Mesozoic era that the warm-blooded birds arose. The birds, like the reptiles, lay eggs with hard shells, and they have several internal features found in the reptiles. The fossil bird Archæopteryx, three specimens of which have been found in Germany, lived in the Jurassic period. Although it was obviously a bird, it retained many reptilian features. Earliest mammals are recognised in rocks of the late Palaeozoic but in the Mesozoic considerable evolution of the group took place. The fossil Trituberculata which are also found in the Jurassic, are believed to be related to forms from which both the marsupial and placental mammals arose. Although insects were present as far back as the Carboniferous, it was in the Mesozoic that many of the groups we know today first appeared.

Great changes also took place in the plant cover of the land during this era. The spore-bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these, the cycadeoids, has become extinct, but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance, and towards the end of the Cretaceous their evolution was extremely rapid. In fact, many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present-day flowering plants.

A New Era.—But, perhaps 150 million years later, all this seemingly everlasting warmth and sunshine, the lush tropical life, the giant reptiles who had ruled the world, were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Caenozoic was beginning, ushered in by a period of upheaval and volcanic activity, following which the map of the world came to resemble more closely the picture we know today. The cold period may have lasted several million years, and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era, the seed-bearing flowering plants, the birds, and the mammals. The once all-powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today: the snakes, lizards, crocodiles, and alligators. It was at this time, too, that, long after the creation of the mountains of Scotland and Norway (the so-called Caledonian revolution), or even of the Appalachian mountains (the Appalachian revolution), there arose the great masses of the Alps, the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent, the Caenozoic revolution. Initially, as we have seen, the climate of the Caenozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached, only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

The Great Ice Age.—The latter was separated by interglacial periods when the climate was milder—we are, in fact, living at the moment at the end of the last Ice Age, for the retreat of ice from Europe began only about 25,000 years ago. It must be remembered, however, that even at the height of the Glacial periods the ice never extended over the whole face of the earth: it was, indeed, limited to an area which never moved farther south than what is now Northern Germany, Northern France, the larger part of the British Isles, small areas in the North of Asia, and about half of the North American continent.

THE EVOLUTION OF ORGANISMS.

Introduction.—It is commonly thought that the great 19th cent. naturalist Charles Darwin was the first person to suggest that life had continually evolved. However, the idea that species of living organisms could change over long periods of time was considered by some Greek writers and, much later, by the Frenchmen Buffon and Lamarck at the end of the 18th cent. Further, the work of the 18th cent. geologists such as James Hutton and William Smith provided a basis without which Darwin's contribution would have been impossible. Hutton showed that the earth's surface had undergone prolonged upheavals and volcanic eruptions with consequent changes in sea level. This implied that the earth was much older than had previously been supposed. Smith developed a method of dating the geological strata by means of the fossils found in them and demonstrated that widely different types of animals and plants existed at different periods of the earth's history. As described in the previous section a general picture is presented of the evolution of organisms from the simple to the complex and from the aquatic to the terrestrial environment. These discoveries were in conflict with the Biblical account in the book of Genesis and, although various attempts were made to explain them away or discredit them, it became abundantly clear that through millions of years life has been continually changing, with new species constantly arising and many dying out. Before considering Darwin's major contribution to the theory of evolution it will be appropriate to outline briefly the various lines of evidence which indicate that, in fact, evolution has taken place.

The Evidence for Evolution.—

1. *The Geological Record.*—It has already been pointed out that successively younger rocks contain fossil remains of different and relatively more complex organisms. The spore-bearing plants preceded the gymnosperms and the angiosperms arose much later. Similarly in the vertebrate series the fish appeared before the amphibia which were followed by the reptiles and later by the air breathing, warm-blooded birds and mammals. On a more restricted level the rocks provide even greater support for the occurrence of evolution. For example, the evolution of the horse has been worked out in great detail from the small Eohippus which was about a foot high and had four digits on the forefeet and three on the hind feet to the large one-toed animal living today. However, such complete series are rare and the geological record is very incomplete. There are a number of gaps, particularly between the major groups of organisms. No satisfactory fossil evidence is known of the ancestors of the angiosperms (F32) and although some may be discovered it could be that they did not grow in conditions which favoured their preservation as fossils. On the other hand, Archæopteryx (F33) provides an indisputable link between the reptiles and the birds.

Another important point should also be mad about the geological record. Although we tal about the age of fishes, the age of reptiles and s on it must be emphasised that these are the period during which particular groups were abundant c even dominant. Each group probably orig nated many millions of years before it becam widespread. Further, some groups, such as th giant reptiles and the seed-ferns, died out completely whereas others, the fishes and true fern for example, are still common today. However even in the latter groups there is evidence tha they have continued to evolve so that many fishe and ferns that exist today are very different fron those of the Devonian and Carboniferous period (F33). On the other hand, the geological recor also shows that some species, for example th Maiden-hair tree, have remained unaltered fo many millions of years.

2. *Geographical Distribution.*—Nearly all th marsupials or pouched mammals are found onl in the Australian continent which was cut off fron the mainland about 60 million years ago. All th fossil evidence indicates that at that time th eutherian or placental mammals did not yet exist The marsupials are the only naturally occurrin mammals in Australia but since the isolation o the continent the group has given rise to a larg number of species very similar in appearance t those which evolved elsewhere in the worl among the eutherian mammals (F27(1)). Ther are marsupials which look like wolves, dogs, cat and squirrels; yet they have no close biologica relationships to these animals. Further, som marsupials such as the kangaroos have evolve which are unlike any other creatures in the res of the world. Quite clearly the isolation o Australia so long ago has resulted in the evolutio of these distinct types. A similar small-sca effect of isolation was studied by Darwin in th Galapagos islands where each has its own distinc flora and fauna which differ also from those of th S. American mainland.

3. *Anatomy.*—The comparative study of th development and mature structure of the mammalian body provides much evidence that all th species have evolved from a single ancestral stock Although the arm of an ape, the leg of a dog, th flipper of a whale and the wing of a bat appea very different externally they are all built on th same skeletal plan. It would be difficult to explain such similarities unless they had all evolve from a common type. There is also evidence tha the early development of an animal recapitulate its biological history to a certain extent. Fo example, the gill slits found in fish are forme during the early stages in the development of mammal although later they disappear. Finally apparently useless vestigial structures sometime occur which would be inexplicable unless regarded in the light of an evolutionary history In man a small appendix and vestiges of a thir eyelid occur but these are functionless althoug in other animals such structures are well develope and functional, *e.g.*, the appendix in the rabbit.

4. *Human Selection.*—During his brief histor on earth modern man has continually selected an bred animals and plants for his own use. W have only to look at the various breeds of dog which have been developed from a single wild typ to see that under certain circumstances grea structural divergence can occur in a species eve in a relatively short time.

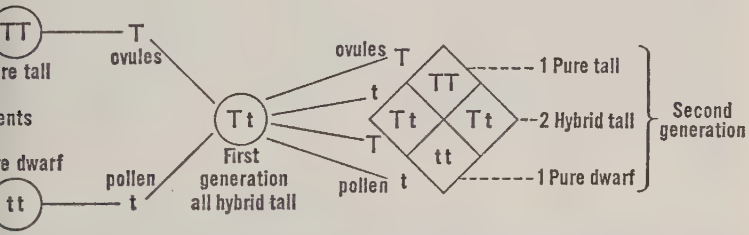
The Darwinian Theory of Evolution.—Darwi amassed a great deal of information such as tha outlined above which convinced him that evolution of life had taken place over millions of year His was the first real attempt to collect all th evidence scientifically and no other satisfactor alternative explanation of all the facts he pr sented has been proposed. Perhaps even mor important was his attempt to explain *how* evolution had actually occurred. He published h theory after many years of work in his boo *The Origin of Species by Means of Natural Sele tion* in 1859. Some of his ideas have since bee modified owing to our increased knowledge genetics but they are so important that it worth while recounting the main points of h theory.

The Struggle for Existence.—It is clear that
ature there is a severe struggle for existence in
nimals and plants. Over a period of time the
nber of individuals of a species in a given com-
ity does not vary greatly. This implies that
number of progeny which survive to become
ure breeding individuals more or less replaces
number of mature ones that die. Generally
aking the reproductive output of a species is
h greater than this. For example, a single
e foxglove plant may produce half a million
ls each one of which is potentially capable of
ng rise to a new individual. Obviously nearly
he progeny die before reaching maturity and
chance of any single one surviving is very
ote.

Variation.—The individuals of any genera-
of human beings obviously differ from one
ther and such differences are found in other
nisms. No two animals of the same species
ept perhaps for identical twins) are exactly
e and when a large number of individuals are
mined it is clear that they vary considerably
tructure, colour, activity and so on. Darwin
pointed out that generally these variations
e passed on from one generation to the next,
example, the children of tall parents tend to
v tall.

Survival of the Fittest.—If there is an intense
ggle for existence in their natural environ-
t among individuals of a species having
erent characteristics, those which are best
ted" to a given set of conditions are most
y to survive to maturity. These will repro-
e and the features which enabled them to
ive will be passed on to their offspring. This
ess is liable to continue and a species will be-
e better adapted to its environment.

Natural Selection.—Over a long period of time
environment of a given species is never stable
will change in various ways. As it does so
characters which best fit the individuals to the
nged environment will be selected (not
ciously of course) and the species will change.
environment may change only in part of the
e of the species and thus lead to divergence
the production of a new species alongside the
one.



arwin and Lamarck.—Darwin pictured evolu-
as a slow continuous process with natural
tion operating on the small inheritable varia-
s found between the individuals of a species
h are undergoing intense competition. This
ects the important effect of the environment
he growth and structure of the individual. It
vious that external conditions will affect the
lopment of an organism, for example the
t of various soil conditions on the growth of a
t or the amount of food material available to
nimal. Lamarck maintained that the charac-
acquired by an individual owing to the effect
s environment could be passed on to its off-
g. Undoubtedly characters are acquired by
individual during its growth but in spite of
y attempts to prove otherwise no experiments
been done which prove conclusively that
e are inherited by the offspring. Thus
arck's theory that evolution has occurred by
nheritance of acquired characters is not gener-
acceptable today.

tion Theory.—The data accumulated by
vin showed that the variations between individuals of a species are small and graded into one another. If a particular character in a group of individuals is measured it is found that it varies symmetrically about a mean or average, with most values clustered about the mean and with few extreme ones. Darwin himself was worried about this fact because, although selection over a long period of time might shift the position of the mean, he did not see how it could bring about the discontinuity necessary for the establishment of a distinct new species. De Vries in his *Mutation Theory* published in 1901 put forward the view that evolution depends, not on the accumulation of continuous minute variations, but primarily upon large discontinuous variations or mutations. The importance of such spontaneous "sports" was considered by Darwin but he rejected the idea because when they appear they are usually "monstrous". Such individuals are less "fitted" to their environment and therefore they will not survive to reproduce and give rise to a new species. That mutations are important factors in evolution is undoubtedly true but modern work has shown that the whole problem is far more complex than either Darwin or De Vries supposed.

Mendelism.—It is remarkable that in spite of carrying out many careful experiments on inheritance in plants Darwin did not discover the simple laws which are the basis of modern genetics. Mendel investigated inheritance in the garden pea and published his results in 1865, *i.e.*, at the time that Darwin's work was being widely discussed. However, Mendel's important discoveries were not generally known until 1900. When he crossed a pure breeding tall plant with a pure breeding dwarf plant all the progeny were tall. When these plants were self-pollinated the next generation consisted of approximately one quarter dwarf plants and three quarters tall. From this and similar experiments Mendel deduced that the "factors" passed from parents to offspring were paired, only one of the pair came from each parent and that one could be dominant over the other. When he dealt with two pairs of characters, *e.g.*, tall or dwarf plants and round or wrinkled seeds, he found that they segregated and recombined independently and in predictable ratios.

The importance of Mendel's work in relation to evolution is that it showed that there was no blending of the characters in the offspring. Mutations can be hidden as recessive characters in a population and are not diluted or lost. Although they may not be of importance when they first appear they may be so if the selection pressure changes and they become of survival value. Thus specific characters may change or diverge and evolution will take place. His investigations also showed that recombination of factors could give rise to plants with new characteristics. By crossing a pure bred tall plant having round seeds with a dwarf plant having wrinkled seeds he produced in the second generation some tall plants with wrinkled seeds and dwarf plants with round seeds. When a large number of characters are involved it is obvious that considerable variation and recombination occurs upon which natural selection can work.

Mendel was fortunate in his choice of experimental material with its easily recognisable contrasting characters. It is now known that his "factors" are the genes carried by the chromosomes in the nucleus of the cell. At the present time the biochemical basis of heredity is being vigorously investigated. *See* F24.

THE ORIGIN OF LIFE.

We have seen in the previous two sections that life has existed on earth for many millions of years and that it has continuously changed or evolved. This raises the obvious question of the origin of life on earth. There are three possible explanations: (*a*) that it was supernaturally created; (*b*) that living organisms arrived from some other part of the universe; or (*c*) that it arose by natural processes from inorganic matter. The first explanation is not strictly scientific, *i.e.*, it does not elucidate observations in terms of natural laws. The second possibility, if true, only pushes the problem one stage farther back. It would also require an explanation of how living organisms could survive the hazardous journey through space. There remains the third suggestion that life arose on the earth at an early stage in its long history. This view is accepted by most scientists today, and N. W. Pirie has proposed the convenient term *biopoesis* (life-making) for the origin of life. The approaches to the problem until recently have been mainly speculative, but modern molecular biology is pointing the way towards an understanding of the origin of life. People who are interested in this subject will find J. D. Bernal's *The Origin of Life* (1967) very informative.

Chemical Conditions before Life appeared.—The earliest fossil remains found in the rocks are of relatively complex organisms. Undoubtedly life first appeared much earlier than the time when these organisms existed, and in a much simpler form. J. D. Bernal has pointed out that biopoesis involved development from the simple to the complex and that Darwin's concept of evolution has to be projected backwards to include the chemical evolution of non-living and pre-vital substances. All living things are built up from organic compounds, which contain the element carbon. These compounds are extremely complex, and a single molecule of a protein may contain many hundreds of atoms. Proteins, which are the structural basis of protoplasm, consist of many simpler amino-acids linked together. Thus, before considering the formation of the complex organic compounds found in living organisms, the formation of the simplest organic substances, such as hydrocarbons, must be dealt with. Presumably at an early stage in the earth's history there were land masses, seas and rivers, an atmosphere, but no life or complex organic compounds. It seems likely that the atmosphere consisted of a mixture of nitrogen, carbon dioxide, hydrogen, ammonia, and methane, but probably no oxygen was present. Therefore the condition on earth when life first arose were probably ver different from those today, and A. Oparin an J. B. S. Haldane concluded that thes favoured the formation of energy-giving organi molecules. Recent experiments in Russia an America have shown that if mixtures of the gase mentioned above are exposed to electrical discharges or ultra-violet light many organic molecules are formed, including those of amino-acids This suggests a way in which simple organi compounds may first have been formed on earth as its atmosphere would have been exposed t both electrical discharges (lightning) and ultra violet light (from the sun).

From Simple to Complex Molecules.—A furthe step would involve the formation of sub-vita systems which, using this energy, could grow split, and reproduce themselves. Haldan suggested that these may have been comple phosphates, but J. W. S. Pringle believes tha they were oxidised hydrocarbons. The maintenance of these sub-vital systems poses tw problems, their protection from the turbulence c their environment and an adequate concentratio of their constituents. According to Pringle, the existed in the depths of the oceans, but Haldan suggested they occurred in water-logged soil Bernal considers they may have been adsorbed o to certain clays along shores and estuaries wher the clay minerals might also have acted as in organic chemical catalysts and promoted th building of larger molecules. Pirie has made th important point that probably many sub-vita systems were formed over a long period of tim and that life on earth today represents only on or a few of the most successful.

The Need for More Research.—Another crucia step would be the development of a cell membran which would contain and protect the system withi but which would allow the interchange of substances between the system and the environment No useful hypothesis has been suggested for this although Haldane put forward the view tha this was a highly improbable event which occurre once to form the first cell.

Obviously we are far from having an answer t this intriguing problem, which has become of eve greater importance with the beginning of spac exploration and the possibility of finding life o other planets. It is one which can be fully answered only by the joint efforts of scientists c many disciplines, astronomers, biologists, chemists, and physicists.

III. THE ORIGINS OF HUMAN SOCIETY

THE EARLIEST MEN.

Before describing the earliest men, it is important to try and define just what is meant by "Man." Man is a member of the Order of Primates and of the Sub-Order Anthropoidea, which includes also apes and monkeys. Both Man and the apes belong to the Super-Family Hominoidea, which is subdivided into two Families: the Pongidae or anthropoid apes; and the Hominidae, which includes all extinct and modern forms of Man. The most important anatomical difference between the two Families is that hominids walk upright, whereas pongids are dependent also on their arms for locomotion.

The common ancestral stock of these two Families is represented by such fossil forms as *Proconsul* from East Africa, which lived during the Miocene period about 20 million years ago; these early apes show certain characteristics of the "hominid" line which are not found in the great apes of today. The modern apes have specialised for life in the trees, but some of their ancestors must have left the forests and taken to life on the open plains. In this new environment, the arms no longer had to be used for swinging from tree to tree and gradually the pelvic girdle and lower limbs became adapted to an erect posture. This development had far-reaching effects: it meant that the hands were now free fc tool-using and tool-making.

The Australopithecines.—The earliest know hominids are the Australopithecines of E. and S Africa which lived over a million years ago, durin the later part of the Lower Pleistocene. They ar so ape-like in appearance that for many year scientists disputed that they were hominids rathe than pongids. But, although they cannot be regarded as " men " in the sense that we speak of a members of the genus *Homo* as men, the shape c their pelvis and limb bones makes it certain tha they had adopted the erect posture, and for thi reason they are classified as hominids.

The first *Australopithecus*—a name which mear "southern ape"—was found in 1924 at Taung Bechuanaland, by Professor R. Dart: it was th skull of a child, and therefore its true position i the evolutionary scheme could not be assesse with certainty. From 1936 onwards, howeve adult remains of similar creatures were found b the late Dr. R. Broom in the limestone caves c the Transvaal. These fossils were given variou names, but it is now generally agreed that the are all members of one genus. Probably tw species are represented: one is small and unspecialised, the other larger and more like th dern gorilla. Both had small brains, but en their size is taken into consideration the in is relatively larger than that of modern apes.

Occasional finds of crude stone tools in the South ican caves suggested that the Australopithe- es might have been tool-makers. This view med to be supported by a discovery in East ica in 1959. In the lowest bed of Olduvai ge, Tanganyika, Dr. and Mrs. Leakey found a ll which is similar to the more ape-like of the Australopithecine species from South Africa. own as *Australopithecus* (*Zinjanthropus*) *ei*, it was dated by the potassium-argon hod to about 1,700,000 years. It has a huge ate with enormous molars, hence its popular ne "Nutcracker Man." Also at Olduvai were ains of a more advanced hominid which in 4 was named *Homo habilis*. It seems to be nsitional between the Australopithecines and *no erectus* and there seems little doubt that it this hominid that made the stone tools found Bed I and the lower part of Bed II in ndance.

his "pebble culture", the Oldowan, is known n many parts of Africa. It is the first stage the Palaeolithic or Old Stone Age, which isted from about a million years ago until end of the Ice Age about 8000 B.C.

omo erectus.—The second stage in the evo- on of the hominids is represented by *Homo tus*, or *Pithecanthropus*, as he was formerly ed. His remains have been found in Java, na, and Africa, in deposits dating from the dle Pleistocene, about 400,000 years ago. brain was considerably larger than it had been ng the Australopithecine stage, but it was very small compared with that of modern . The skull is extremely thick, the forehead and sloping, the brow-ridges very heavy, and chin region receding. The first skull of *ecanthropus erectus*—"erect ape-man"—was d as long ago as 1891 at Trinil, Java, by Dr. E. ois. Other specimens were discovered by G. H. R. von Koenigswald during the 1930s, uding a rather earlier form named *P. robustus* a massive jaw of *Meganthropus* which probably esents the Australopithecine stage in Java.

he first remains of Pekin Man from the cave of u Kou Tien near Pekin were discovered in and 1929. Named *Sinanthropus pekinensis*, e specimens are now accepted as being a species of *Homo erectus*. A sad fate befell original material: it was all lost in American ds during the war as it was being evacuated China. There are casts of the originals ever and two more pieces of mandible were d in 1959. Perkin Man was accompanied by e tools of stone and bone and hearths show he could make fire. Large accumulations of prove that he was a skilful hunter and an skulls smashed to extract the marrow cate that he was also a cannibal.

ne only certain representatives of *Homo us* outside Asia consist of a skull from Bed Olduvai Gorge, and jaws found in Algeria and occo in 1954–5. They were named *Atlan- ous*, but are almost identical with jaws of n Man. They were accompanied by eulian hand-axes, pear-shaped tools which sted with very little change from the end of pebble-culture for about 200,000 years. The vai skull, found in 1960, was also associated hand-axes. It has been dated by the ssium-argon method to about 490,000 years.

ne earliest human remains from Europe con- of an isolated jaw found at Mauer, near elberg in Germany in 1907. It is extremely ive and has a number of features which dis- uish it from *Homo erectus*. In 1964 and 1965 teeth and parts of a skull were found at esszöllös in Hungary which may be equally nt. Both are thought to be roughly con- orary with Pekin Man.

ese remains date from the second of the glacial advances which followed one another ng the Pleistocene period. In northern pe and North America deposits from these essive glacials and interglacials provide a s of dating fossils and implements found in . Two human skulls dating from the Second or Great Interglacial, about 250,000 years ago, are known from Europe: from Steinheim in Germany and from Swanscombe in Kent. These are roughly contemporary with the last survivors of *Homo erectus* in North Africa. Like the latter, Swanscombe Man was associated with hand-axes.

In the Steinheim brain-case we have, for the first time, proportions not very much smaller than those of modern man. The forehead, however, is sloping and there are well-marked brow-ridges. Probably both the Steinheim skull and the fragmentary Swanscombe remains are ancestral both to modern man and the Neandertal people.

The Neandertaloids.—During the early part of the Fourth Glaciation, in Upper Pleistocene times, the Neandertal race occupied parts of Europe, western and central Asia, and North Africa. At the same time rather similar people lived in southern Africa (Rhodesian Man) and Java (Solo Man). In Europe the Neandertalers lived in caves to protect themselves from the cold. They also buried their dead in caves, with the result that many of their skeletons have been preserved. The first Neandertal remains were found before the end of the last century, in the Neander valley in Germany, as well as in Gibraltar, Belgium, and Jugoslavia. Then many others were discovered in France, and now they are known also from central Siberia and from Cyrenaica and Morocco in North Africa.

The so-called "classic" Neandertalers had a rather brutal appearance, with heavy brow-ridges, sloping foreheads, and receding chins. At Mount Carmel in Palestine these exaggerated forms were found in the Tabun cave, while close by, at Skhul, were others with features far nearer to the men of today. This may be a case of individual variation within a group, or it may mean that Neandertalers interbred with people of modern type to produce hybrids.

Rhodesian Man, though clearly not a Neandertaler, has many distinctive features which distinguish him from modern man, particularly the enormous brow-ridges which form a continuous bar above the eye sockets. The first skull of this type was found in 1921 at Broken Hill in Northern Rhodesia; in 1951, a very similar skull was discovered near Saldanha Bay in Cape Province. The associated fauna and stone tools make it probable that these human remains date from the early part of the Upper Pleistocene, not more than 50,000 years ago and perhaps less. Contemporary and rather similar in appearance is Solo Man from Java, probably a direct descendant of *Homo erectus*, whose remains were found a few miles away.

Homo sapiens.—Events during the Fourth or Last Glaciation can be dated fairly exactly by the radiocarbon method, which, by means of new techniques, can now provide absolute dates over the past 50,000 years. Such dates have supported chronologies previously obtained by studying the geological deposits, which indicate three main cold phases separated by milder periods. Neandertal Man became extinct soon after the first cold phase ended about 40,000 B.C. and was replaced by *Homo sapiens* of completely modern appearance by the beginning of the second cold phase about 30,000 B.C.

Neandertal Man's stone tools were made on flakes; they consisted of points and other weapons which were probably hafted as spears. The implements made by the men who succeeded him show significant advances; they include small knife-blades and engraving tools, specialised for different purposes. It was during this Upper Palaeolithic stage that Man began to concern himself with something more than merely hunting and searching for food. He produced very fine paintings and sculpture, adorned himself with necklaces and other ornaments, and apparently practised magic rites and ceremonies.

Europe.—The earliest known skull of completely modern type comes from Combe Capelle in south central France and was associated with an industry which represents the first stage of the

Upper Palaeolithic of western Europe. The somewhat later Cro-Magnon people, named from a rock shelter at Les Eyzies in the Dordogne, are associated with a culture known as Aurignacian, which is believed to have originated somewhere in the Middle East, perhaps in the region of Palestine. These people were rather tall, with long heads, very large brain-cases, and short, broad faces. They were responsible for very fine cave paintings depicting the animals they hunted, such as the mammoth, woolly rhinoceros, and reindeer.

Africa.—From their original homeland, these people spread westwards not only over Europe but also along the southern shores of the Mediterranean through North Africa. In East Africa too skeletons which are typical of the Mediterranean race have been found associated with an industry not unlike the Aurignacian of Western Europe but considerably later in time. Curiously enough, no skeletons showing characteristic Negroid traits have been found in Africa before post-Pleistocene times, about 8000 B.C., which suggests that the Negroid stock evolved relatively late. In southern Africa there were in Upper Pleistocene times people with very large brain-cases and yet with features reminiscent of the present Bushmen and Hottentots; the first skull of this type, from Boskop in the Transvaal, was found as long ago as 1913.

Asia.—Turning now to Asia, the most remarkable finds of early *Homo sapiens* come from the Upper Cave at Chou Kou Tien (where Pekin Man was discovered). One of the skeletons, an elderly man, is very like the "Old Man of Cro-Magnon." A skull from Niah Cave in Sarawak dated to 40,000 B.C. is the earliest known representative of *Homo sapiens* in Asia. In Java the descendants of Solo Man may be represented by the Wadjak people probably dating from around 8000 B.C., who bear a striking resemblance to the Australian aborigines. They may be roughly contemporary with a skull from Keilor near Melbourne which proves that Australia was populated in late Pleistocene or early post-Pleistocene times.

America.—The question of the date of the first peopling of the New World is very controversial; in nearly every case the geological evidence for the association of early human remains has been questioned. It seems that the first immigrants from Asia crossed the Behring Straits before the end of the Ice Age, perhaps about 15,000 B.C. They are believed to have been of an "archaic White" strain, something like the modern Ainu and Australian aborigines, and probably similar to the "old man" of the Upper Cave at Chou Kou Tien. Later immigrants were fully Mongoloid, and it seems that a mixture of these two strains gave rise to the American Indian.

The End of the Old Stone Age.—From this brief review of developments all over the world, we must return to the Upper Palaeolithic in Western Europe. We left the Cro-Magnons with their Aurignacian culture during the second cold phase of the Last Glaciation. During the time of the main advance of the ice sheets, about 18,000 B.C., the Aurignacian culture died out and was replaced first by the Solutrian and then by the Magdalenian cultures. The Magdalenians are renowned for their very fine working of bone and antler, particularly in the form of barbed harpoons, and for their artistic skill. In many ways their paintings of animals, such as those in the cave of Lascaux, surpass the ones of the Aurignacian period. As the Ice Age drew to a close, however, the Magdalenians disappeared, and with them the great flowering of Upper Palaeolithic art also died out.

Up till the end of the Ice Age, Palaeolithic people must have lived in essentially the same way all over the world. They were hunters and food-gatherers, living in small bands as the Bushmen and Australian aborigines do today. Within these small, isolated groups, certain mutations must have arisen which were advantageous in particular environments. These would have been encouraged by natural selection, thus leading t
the differentiation of distinct races in differen
localities.

After the ice finally retreated about 8000 B.C
the way of life of people in Europe must hav
changed considerably. The great herds of cold
loving animals upon which Palaeolithic hunter
depended for their food either became extinct o
retreated as forests began to spread over the ope
country of former times. The Mesolithic people—
living after the end of the Pleistocene and befor
the Neolithic stage—had to rely increasingly o
fishing and collecting shell-fish to supplemen
their diet.

Outside the areas affected by the ice, however
certain progressive people gave up their nomadi
existence and began to live in settled com
munities. In Palestine and other parts of th
Middle East wild wheat and barley grew and ther
were herds of wild goats and sheep. The Meso
lithic Natufians reaped these grasses and cereal
and domesticated the dog to help in hunting. I
was they who led the way to events which wer
to revolutionise Neolithic Man's way of life
agriculture and stock-keeping.

ENVIRONMENT AND CULTURE.

It is clear that no people could enter a Bronz
or Iron Age unless bronze and iron were, in fact
available in their environment. Hence th
Eskimos, who have no metals available to mak
into weapons or ornaments, still use stone, ivor
(from walrus tusks), and bone. In short, thei
environment does not permit a higher degree o
culture. The primitive races or "backward
peoples have evolved ways of life which are ofte
well adapted to the environments in which the
live. The second point is that great advances ar
made only upon the foundations erected by others
The quantum theory and the theory of relativit
could not have been evolved by the scientists o
ancient Greece or by Galileo or Newton, no
because they were less intelligent than Einstein
but because every innovator can progress only
little beyond what he had received from his pre
decessors in many different lands and time
The house of science is not built top floor first, bu
slowly upon the foundations laid by earlie
thinkers. "Civilisation" is not such a simp
concept as we once supposed, and technologica
advance does not necessarily imply high mora
standards. Scientists are agreed that there ar
no significant intellectual differences between an
of the races in existence today, and that the rea
son why some peoples are relatively backward
either because the raw materials necessary fo
technological advance have been lacking in the
environment, or because by a historical acciden
their country has been out of contact with th
general flow of civilisation, so that the spread
new ideas did not reach within their boundarie
See also Q14(2).

Definition of Terms.—Anthropologists a
agreed that, although it may be quite correct
speak of "national character," we cannot expla
this in terms of race or heredity. The true e
planation is that such traits are cultural rath
than biological in origin, and, since the "cultu
concept" is immensely important in moder
social science, we must first of all define our term

> A *society* is a group of people who live an
> work together, regarding themselves
> members of the group, and feeling towards
> an emotion best described as "belonging."
> A *culture* is the way of life followed by suc
> a group—that is to say, its written or u
> written laws, its religious beliefs, its ideal
> its art, technology, and even its pots and pa

Without written records we are left to deduce t
record of prehistoric man by the culture to whic
he belonged—Azilian, Magdalenian, Acheulia
and so on—and here the archæologist, who know
very little of the ideals and religious beliefs or la
of these bygone peoples is generally thinking
terms of their *material* culture, which includ
objects found during excavations such as pots a
pans, knives, weapons, needles, and ornament

when we talk of culture in relation to present-
peoples, we are more often thinking of the
of life of the group—its ideals, incentives, and
ritten laws. Culture is what has been
ribed as the "cake of custom," and its im-
ance lies in the fact that it is the cement which
s the members of a group into a living
nism.

b-Cultures.—All of us are members, not of one
p only, but of many, and each group, however
l, has a culture of its own, a way of life to
h we must conform if we wish to retain group
bership or, at any rate, the respect of the
r members. As an example, let us take an
inary individual with the name of George
pbell, who happens to be a Lowland Scot,
esbyterian, a socialist, a coal-miner working
ne coal-face in a particular pit, a pigeon-
er, and a follower of Newcastle United
ball team. The interesting thing is that,
ving these facts, we already know a great
about Mr. Campbell; for we can be sure
his membership of these groups (national,
ous, political, sporting, and so on) will
gly influence his behaviour. One of the
us defects of classical psychology and of
popular thought is that it failed to notice
much of the individual's day-to-day be-
our arises, not from the depths of his un-
cious or from what is ordinarily described as
"character," but simply from his need to
rm to the, often unwritten, rules of his
bership groups. If anyone suggested to our
Campbell that he was not an entirely free
t, that he was not as independent as he prides
elf on being, he would, no doubt, be very
yed. Nevertheless, this is merely a common-
statement of fact. Campbell has all the
dices of the Lowland Scot—he thinks that
ation is a "grand thing," that Roman
olics are a dangerous and superstitious sect,
the English are a somewhat inferior nation
the Border who regrettably lack stamina and
igence, and that money, although the root
evil, is a good thing to have and be careful
t. But, had he been born in the South of
, he would have regarded education as the
sive possession of wealthy landowners,
olicism as the only true religion, the English
l have meant little to him at all (until the
war), and his goods would be exchanged by
r rather than money. Mr. Campbell
s his morning porridge and bacon and eggs,
his enjoyment of them is only a prejudice
ed in childhood and his opposite numbers
frica and France enjoy locusts, frog's legs,
nails, which it has never struck him to regard
food" at all. His grandfather might have
a beard, but if Campbell came to work
ng one, he might find himself in difficulties;
is one of the many quite innocuous things
are "not done" in certain groups. Camp-
might, on special occasions, wear a kilt, but
Smith over the Border would find himself
considerable social pressure to stop doing so
ever had the temerity to start. There is no
aying that Scots or Englishmen may not
to the waist in a hot cinema or theatre, but
do not do so, although a miner may do so at
and other people at the seaside. In short,
ampbell, like the rest of us, is for the most
creature of custom.

proved Patterns of Conduct.—If we take the
analogy of the clay, the potter, and the de-
then it will be seen that the newborn child
lay) is modelled by the parents (the potter),
random, but according to the approved pat-
of a particular society (the design). Every-
nto whatever society he is born, is brought up
ve specific attitudes to women or men, to
l relations, to cleanliness, to aggressiveness,
competition, and these attitudes are unique
h society at any given time. Most middle-
Englishmen feel that they ought to "get on"
ave ambitions, that one should not strike a
n, that one ought to have a daily bath, and
t is rude to argue in public with shopkeepers,
rs, and public servants. Frenchmen and
ns have no such inhibitions about arguing in
, and Americans have a much stronger
desire to succeed. Such differences in national or class character may often cause difficulties through misunderstanding. For example, the average British worker attaches more importance to sticking together with his mates than to getting on, and he rather despises the middle-class attitude that one must succeed at all costs, regardless of whom one has to overcome in order to get there. Then the average American is brought up to feel that when he has made more money than someone else, he should be proud of his achievement and make no secret of his opulence, however temporary, while on the other hand the Englishman feels that it is impolite to discuss money or speak of one's achievements. Therefore to the American the Englishman is a queer, reticent, and "stodgy" individual; to the Englishman the American is noisy and boastful. Neither accusation is true—both are judging each other in terms of how they have been taught people ought to behave.

Interaction of Group Influences.—Although we have so far spoken of the national character of such large groups as the British, American, French, and Italians, it is obvious that when dealing with groups of this size composed of many subgroups, the resulting picture will be far from clear. Our Mr. Campbell is, to the foreigner, simply "British," but he is, as we have seen, also a Scot, a Protestant, a member of the working-class, and a miner. So, although he shows many traits which are "British" in the widest sense, he differs in obvious ways from another Britisher who was born in London, is of the middle class, belongs to the Church of England, and works as an accountant. It is not only national, but also regional, religious, class, and occupational groups which influence personality, and there are other factors also at work which we must shortly discuss. Before doing so, however, the reader is asked to turn to Section Q, Part II, where a brief account is given of the researches of Ruth Benedict and Margaret Mead into the cultural ideals of various primitive societies. Primitive peoples are more suited to anthropological studies, because, in the first place, they can be separated into small tribal communities which are, for the most part, not subdivided into regional, class, or religious subgroups. Secondly, they are much less subject to social change, and have remained closely integrated, undivided, and in varying degrees static for considerable periods of time.

Individual Differences.—Now, as we can readily observe, individuals differ quite considerably from each other, even within the same social group, so we must now consider what factors give rise to the individual variations upon the theme set by culture; several, in fact, have already been mentioned. These are, the subgroups to which the individual belongs, his status and role, and his particular upbringing and inheritance. Social change, too, gradually brings about changes in the "basic personality type" of a society, as, for example, the changes in the Englishman's attitude to, say, music and sport which took place between Elizabethan and Victorian times.

1. *The Influence of Subgroups* in bringing about particular attitudes in the individual has already been discussed, and need not be further elaborated here.

2. *Status and Role.*—An individual's status is his position in society, not only in respect of social class, but also in occupational, marital, professional, and other spheres. His role is the behaviour which is associated in that society with a given status. Perhaps these concepts are most simply explained if we regard social life as a sort of stage-play in which each individual is an actor in particular roles: a parson has to act as a parson, a doctor as a doctor, a father as a father, and a manager as a manager. Parsons are expected to talk and dress in a particular manner, fathers to behave in a certain way (which differs in each society), and although every parson or father is an individual in his own right, many of

his acts can be understood only when we realise that he is acting in the way society expects of parsons and fathers. When people break these unwritten rules, difficulties may arise. There is no law which says that a parson may not play the saxophone, but one who did would be looked on somewhat askance by his parishioners, and, although patients sometimes complain that their physician puts on an exaggerated "bed-side manner," they are often even more distressed when he does not. Gordon Rattray Taylor tells of a factory manager who went about in a shabby old car, and who, far from being thought endearing and democratic for doing so, was regarded with disapproval by the workers, who felt that he was "letting down the side" by not behaving in a manner appropriate to his position. This is what is described as "*formal status*," since managers, parsons, fathers, and so on, occupy formal positions recognised by society as at present constituted. There is also *informal* status—that is to say, the type of status allotted to individuals in a small and intimate group such as the working group in the factory. For example, we have George, who is the one who defies management and takes the lead when complaints are to be made; Alf, the one who tells dubious funny stories; Bill, the one who knows all about First Aid; and Harry, the amiable idiot who is always teased by group members but protected from the jibes of the members of other groups. All these individuals have been allotted a certain informal status, and are supposed to act "in character," although each man in another group may play a quite different role. Alf, the joker, may be henpecked at home—a sad little man; Bill, the knowledgeable First Aider, may be a very insignificant member of the local St. John's Ambulance Brigade, to whom he may be the "silly ass"; George, the resentful, may be the kindly father. But within each group their roles are fixed and difficult to evade. Status and role, therefore, have a powerful influence upon behaviour.

3. *Differences due to Upbringing and Heredity.*—Although the influence of heredity, so far as personality is concerned, has been grossly exaggerated, it does indeed play some part. What is inherited, however, is not specific behaviour but temperament, and temperamental differences, being based on glandular and structural nervous factors, are fairly permanent features of the personality. By and large, upbringing determines *what* we do, temperament *how* we do it.

The most important differences between one individual and another in the same culture arise from the vagaries of upbringing; for, even apart from such accidents of fate as the loss of one or both parents, illness in childhood, and natural calamities, the obvious fact is that no parents ever pass on the cultural design to their children without many individual variations. If we picture the cultural design as a rough mould which supplies the main outlines of the pattern, we can also picture the parents as adding individual touches of their own (whether knowingly or otherwise) to a material which already varies for biological reasons. At this point it is necessary to say something of the work of Freud, for it is he who has given us some of our closest insights into what one might describe as the microscopic anatomy of the individual personality. Unfortunately to do so is by no means easy because Freudian theory is extremely complex, and has, furthermore, been considerably modified by later writers of the psycho-analytic school. What is given here must be taken only as a very rough outline of what Freud and later psycho-analysts have been trying to say.

FREUDIAN THEORY.

The newborn child is a young animal, with no morals or sense of reality and no "instincts" as we understand the term in the lower animals. It has only two great drives which Freud takes to be fundamental—sex and aggression. Although Freud described sex and aggression as "instincts," the word is nowadays reserved for a particular form of behaviour which, if it exists at all in man, is certainly a dying category—it should be used solely for behaviour which is inborn, relatively fixed, and automati Ants, bees, and wasps, for example, carry out th most detailed acts; nest-building, caring for th grubs, or food-collecting and storing; but the can be no doubt at all that none of these acts in any way intelligent. They are based on th insect's nervous structure, and could not occu otherwise than they do. Among the highe animals, the birds and mammals, such instinctu behaviour comes to be increasingly modified b intelligence, but it is only in man that intelligenc assumes its full significance, and all behaviour modifiable and no longer automatic. The drive of sex and aggression in man do not involve an elaborate type of fixed behaviour pattern; the are simply the raw material of action, to be mod fied in many different ways as the child learn from its parents and others. Briefly, all anima in varying degrees (more so in the lower animal less so among the higher) are like tram-ca moving upon fixed rails, and however comple the route they take, it is largely what has bee laid down from the beginning. Human being on the other hand, are like motor cars, whic although making use of the same source of energ as the animals, can utilise it to drive where the please.

Sex.—Freud used the word sex in a rathe specialised sense to apply, not only to sexu behaviour in the ordinary meaning of the wor but also to such behaviour as eating and drinkin excretion, and, at a higher level, to love and frien ship. It might almost be said that in Freudia terminology sex and aggression are words used t describe the two poles of desire, positive (love, lus hunger, longing, wanting) and negative (hatin fearing, avoiding, killing, getting rid of things).

The Id.—The problem of society is to modif this primitive creature which can only need an desire, hate or fear, want pleasure and avoid pai into a civilised being, and this is the problem delegates to the parents, who, in the long ru utilise the child's need for security or protecti and care to compel it to act in approved way The baby learns, by imitation, by trial and erro by punishment or the threat of punishment, b love or fear of the loss of love, to conform more less to social standards. The primitive aspect the mind, which includes not only the innate driv of sex and aggression but also all those though and emotions which, in the course of developmen the individual comes to accept as forbidden, described as the Id, and just because it contai this sort of material, thoughts and emotio within it become or remain unconscious.

When the infant is born, its mind is all Id, b sooner or later the child is confronted by ster reality when it comes to realise that desires are n satisfied automatically. Sometimes it is hung and food is not forthcoming, sometimes it is w and uncomfortable and has to wait to "changed"—all these events occur even to t most fortunate baby.

The Ego.—So a part of the mind comes to separated off from the primitive Id, who function it is to deal with reality, and this part known as the Ego—the conscious mind as we kn it in adult life. The basic function of the Ego is deal with life as it really is, not as we should like to be.

The Superego.—Still later, perhaps about t age of three or four, the child is faced by anoth problem; for it has to start conforming to t ethical dictates of society, to what is ordinari described as the moral code. It has to learn wh is done and what must not be done, and so further division in the mind takes place and pa of the mind begins to specialise in moral contr This part is known as the Superego. The Supe ego arises in two distinct stages—firstly, the chi comes to realise that under penalty of punishme or disapproval, it must obey its parents; at th stage, then, compulsion comes from outsi Later, however, the child by a process of wh Freud describes as "introjection" takes t parental standards within itself. One part of t mind, as it were, plays the role of the moral pare in relation to the rest. This is the fully-fledg Superego.

Character.—An individual's character is the sult of a three-cornered struggle between the imitive biological drives (represented by the Id), e hard facts of reality (represented by the Ego), d the moral dictates of society (represented by e Superego). The Superego is the censor which rbids thoughts or actions not allowed by society , more accurately, thoughts or actions which ere forbidden by the parents in early childhood. s one writer says, the Superego is a sort of ychological gyroscope which places control thin the mind and avoids, in varying degrees, e need for outward compulsion. When the ctates of the Superego are transgressed the lividual has a sense of guilt and feels himself ore or less a social outcast.

Expression of Primitive Impulses.—But the imitive drives are very powerful and cannot be tally repressed—they demand some sort of tlet, and are given it on condition that they e suitably modified or appear in socially acceptle forms or at least at socially acceptable nes. Most societies, for example, permit the pression of primitive emotion at certain periods under certain conditions; the sexual drive is rmitted expression in marriage, and naked gression in warfare. But more often the ves have to be modified by one or other of two ndamental mechanisms known as reaction mation and sublimation. In the case of ction formation the energy of the forbidden pulse is utilised in emphasising its opposite; s as if the individual were saying: "Of course lon't have such wicked desires—you can see I quite another sort of person." Perhaps this chanism will become clearer if we give some amples.

(1) Even the layman is aware that people who excessively puritanical are frequently by their y puritanism demonstrating quite the contrary pects of their character. We laugh at the erly lady who is afraid of finding a man under bed precisely because we are aware consciously unconsciously, that she would not have the r if she did not also have the hope. Similarly, en we read in the papers of a gentleman who so approves of obscene books or magazines that buys hundreds of them to find out whether y are suitable or not for others to read, we may pect that his own motives are not entirely oid of suspicion. In short, the characterit of puritanism is sometimes a reaction forman against strong sexual desires; the individual ghting in the outer world the very problem he nable to deal with in his own mind. *See also* **Nature of Aggression, Q7.**

2) The second method of dealing with primitive ulses is by sublimation—that is to say, by king them socially useful. A butcher, a surgeon, a prize-fighter are all expressing in modified n their latent sadism, but in a way which is ognised by society. Women who have wanted dren and failed to have them may become chers, helpers in nursery schools, and so on in aluable attempt to satisfy a frustrated need. reud is correct, the frustrated sexual curiosity hildhood may later take the form of a desire know, causing the individual to become a ntist or a bookworm. Art, sculpture, and nting may all be sublimations of the infant's ural dirtiness and pleasure in messing about mud, water, or even its own excretions. reader may or may not accept these latter mptions, but it is only fair to say that those are in a position to know have found a great to support Freud's theories.

ental Mechanisms.—Even in adult life the vidual's adjustment to reality—the "hard s of life"—and to moral problems is never plete, and self-deception is common. In connection Freud describes various mental hanisms which even those who do not accept Freudian theory in its entirety have found able in understanding human behaviour. will conclude, therefore, by describing some hese forms of self-deception here and giving nples of their influence upon human behaviour.

1. *Displacement.*—An emotion, when conditions do not permit its being directed towards a particular object, may be directed against another which originally had nothing to do with it. "Love on the rebound" is an example of this in which, when the original object of love has disappeared, another is quickly found, not because of any real qualities possessed by the new object, but rather because the emotion demands some outlet. In Nazi Germany Hitler permitted the displacement of economic and other resentments felt by the Germans after the Treaty of Versailles on to the Jews and Communists, who were thus made scapegoats for the convenience of the Nazi party. It is important to understand that this is one of the commonest types of mental mechanism which is universally, although unconsciously, used by us all.

2. *Projection.*—This is an example of a mechanism which has already been demonstrated. In brief, it means the tendency to project the objectionable qualities we refuse to recognise in ourselves upon others. "It is not I but he who is thinking and doing these wicked things." Thus, as we have seen, people who will not admit to their own impure thoughts accuse others of possessing them; those who are aggressive believe that everybody else but themselves are aggressive; the greedy accuse others of greed, and so on. Carried to an extreme degree, this is the mechanism behind persecution mania or paranoia, as the psychiatrist calls it. Projection is another very important trick of the mind, and its social effects are often all too evident.

3. *Compensation.*—Alfred Adler, one of Freud's pupils who later founded a separate system of psychology, was the first to draw attention to this important mechanism.

Briefly, Adler pointed out that those who suffer from a deep-seated sense of inferiority (whether due to physical or mental defects or to lack of affection in childhood) have a strong tendency to compensate for this either by overcoming the actual defect or by becoming superior in some other field. *See* **Individual Psychology, Section J.**
